The Chairman described the opening of the Bank's 5000th office in February 1979 as a landmark in the history of banking. The quick and purposeful expansion of the Bank in recent years had made it the largest commercial banking branch network of its kind in the world.

Shri Nambiar assured the shareholders that the growing size of the Bank had had very little effect on its organisational and operational efficiency. If anything, it had conferred a number of advantages. Indeed, plans were already on hand for managing and controlling a much larger network.

Shri P. C. D. Nambiar

Shri Nambiar said:

It gives me great pleasure to welcome you to the Twenty-fourth Annual General Meeting of the State Bank of India. Kanpur has never been the venue of the Bank's Annual General Meeting so far. In keeping with our policy of holding these meetings at Local Head Offices not covered in the past, it was decided to hold this year's meeting at Kanpur, the most important industrial centre of the largest state in the country. The Annual Report, including the Balance Sheet as at the 31st December 1978 and the Profit and Loss Account for 1978, is already in your hands. You will find that the year 1978 witnessed a significant growth in the Bank's deposits and advances, especially advances to the priority sectors and the weaker sections of the society. Profits were also higher than in 1977.

Dividend

The Bank had declared an interim dividend of Rs. 12 per share for 1978. By declaring a final dividend of Rs 11, the total dividend for the year amounted to Rs 23 per share. This is in line with the policy we have adopted consistently since 1961 in declaring dividends.

Overall Performance

The Bank's Overall performance during 1978 can be viewed with satisfaction. In the field of deposits, the Bank improved on its performance by mobilising a sum of Rs 1,194 crores as against Rs 830 crores in 1977. The rate of growth of deposits at 24.5 per cent was better than that of 16.9 per cent in the case of all other scheduled commercial banks.

In keeping with the Reserve Bank's policy of consolidation, the number of offices opened during 1978 at 314 was lower than 426 in 1977. The Bank, however, intensified its efforts for upgradation of sub-offices into full-fledged branches and opening of more Agricultural Development Branches, in order to increase the flow of credit to the priority sectors. Accordingly, 402 sub-offices were upgraded and 65 Agricultural Development Branches were opened in 1978 as against 198 and 52 respectively, in 1977.

Your Bank achieved a record growth of Rs 379 crores in priority sector advances, thereby raising their share in total advances from 31.25 per cent at the end of 1977 to 32.28 per cent at the end of 1978. If the advances granted under the Ship Acquisition From Abroad Under New Scheme, which have no resource implications for the Bank, were to be excluded from the total advances, the ratio would rise to 33.70 per cent which would exceed the norm of 33.33 per cent to be achieved by March 1979. Under the Differential Interest Rates Scheme, our lendings increased by Rs 6.5 crores taking the percentage of such advances to total advances as at the end of the previous year to 0.97. Nearly 40 per cent of DIR advances have been extended to members of the Scheduled Castes and Scheduled Tribes.

Agricultural and rural development have all along been receiving the desired attention in our corporate policy and the performance of the Bank is in keeping with the importance attached to this activity. During the two-year period ended June 1978, the number of farmer's accounts and the amount of direct agricultural advances of the Bank increased by 8.81 lacs and Rs 243 crores as against the combined increase of 7.68 lacs and Rs 267 crores respectively reported by all other public sector banks.

Progress under Special Schemes

When I last addressed the shareholders, I had mentioned some important measures initiated by us for promoting rural development and entrepreneurship and for providing equity support to small entrepreneurs. I would like to apprise you of the progress made by

us in implementing these measures. The Integrated Rural Development Programme launched by us on a pilot basis, is being actively implemented in 214 villages selected for the purpose. Over 26,000 villagers have been provided with financial assistance of the order of Rs 2.96 crores to support their productive endeavours. A number of non-financial activities of a social character like removal of illiteracy, improvement of sanitation, provision of medical, library and recreational facilities, supply of drinking water, etc., have also been undertaken. The plan to promote entrepreneurship, especially in the backward areas, has got off to a good start and so far ten programmes have been conducted in various lead districts of the Bank covering about 250 potential entrepreneurs. We are providing the necessary financial and consultancy support to eligible entrepreneurs to help them in their ventures. The progress in conducting the programmes is expected to gain further momentum during the current year. Although initially the disbursal of assistance from the Equity Fund of Rs 1 crore was slow, with adequate publicity and special drives launched by the Bank, the scheme has generated enthusiastic response and, so far, assistance has been extended to 25 units. Having regard to the prime need to provide equity support to small entrepreneurs for promoting self-employment, we have strengthened the Fund by transferring a further sum of Rs 2 crores.

Capital Funds

In order that the Bank's balance sheet should, to the extent possible, reflect its intrinsic financial strength, we have, from 1974, followed a policy of improving the ratio of published capital funds to deposit liabilities, generally known as 'Capital Funds Ratio'. Apart from regular transfers from profits, inner reserves have also been mobilised to the extent of Rs 70 crores up to the end of 1977 for strengthening the capital funds. In furtherance of this objective, additions to capital funds of the order of Rs 31 crores — Rs 7 crores from the current year's profits and Rs 24 crores from the inner reserves — have been made in 1978. By effecting these transfers, the capital and reserves improved from Rs 27.53 crores as at the end of 1973 to Rs 154.85 crores as at the end of 1978, resulting in the Capital Funds Ratio improving from 1.1 per cent in 1973 to 2.2 per cent in 1978.

In the context of the increasing and diverse needs of India's foreign trade, banks in India are being called upon to provide sophisticated financial support of a larger magnitude. The expanding overseas network of Indian banks and the need for improving their profits often require raising of sizeable resources in the international market. The international banks invariably evaluate the risk element involved in such transactions by assessing the financial strength of banks, particularly in terms of their Capital Funds Ratio. At present, the average of this Ratio obtaining in the banking system in India is 1.1 per cent as compared to 4 per cent to 6 per cent in the case of international banks. Despite best efforts, the State Bank of India has also not been able to improve upon its ratio of 2.3 per cent reached in 1976. In fact, notwithstanding the transfer of a total sum of Rs 31 crores to published capital funds in 1978 as against Rs 16.4 crores in 1977, the Bank's Capital Funds Ratio declined marginally to 2.2 per cent.

The need to strengthen the financial position of the banking system is, therefore, obvious and the ideal way to achieve this objective, undoubtedly, is not only to maintain but to improve its profitability. In reality, however, profitability of most banks has been showing a declining trend and the scope for improving it appears to be limited. The reasons for this are not far to seek. The rapid expansion in the branch network especially in the rural areas, high cost lending to priority sectors, rehabilitation of sick industrial undertakings — all these are activities which subserve national objectives, but they do make inroads into the profitability of banks. The problem has been further accentuated by the rising staff costs. The banks are firmly committed to support the programme of rural development, which postulates opening of a large number of rural offices in the underbanked regions of the country, and to meet the credit needs of priority sectors, they have also to support, on an increasing scale, the needs of industry and foreign trade. It is, therefore, imperative that the erosion in the profitability of the banking system should be stemmed and the banks' capabilities for undertaking developmental tasks improved by building up their financial strength. I would, in this context, suggest a study in depth of the causes leading to the decline in profitability of banks and the adoption of remedial measures. In the interim, I would submit that suitable fiscal and other reliefs should be afforded to the banking industry in the light of the findings of the Working Group on Banking Costs, Operational Efficiency and Profitability of Banks set up by the Reserve Bank of India.

Opening of the 5000th Office

An important landmark in the history, not only of your Bank but also of branch banking, was the opening of the 5000th office of the Bank in February this year at Satbarwa, a small tribal village in Bihar. With the quick and purposeful expansion of the Bank in recent years, it can now claim to be the largest commercial banking branch network of its kind in the world. While it took 7½ years to add 500 offices to the 477 inherited from the Imperial Bank of India in 1955, the last 1,000 have come in just 2½ years.

Size and Efficiency

A view has been expressed that limiting the size of banks is essential for maintaining their efficiency. Let me assure you that the growth in the size of your Bank has had very little effect on its organisational and operational efficiency. If anything, our size has enabled us to take in our stride the increasing costs of developmental activities and to continue to maintain the profitability of our operations. The growth in size of the Bank has been well supported by the systematic strengthening of the organisational set-up through decentralisation of functions and delegation of authority. In 1970, we conducted a thorough review of the Bank's organisational structure with the help of management experts and carried out suitable modifications in order effectively to sustain a growth in size up to at least 5000 offices. As the Bank rapidly approached this level, we initiated, again with the assistance of management consultants, a detailed review of the organisation which would enable us to manage and control about 7,000/8,000 offices, thus taking care of our growth over the next 7/8 years. The report of the Review Team has been received and is under consideration.

The Bank modified its scheme of delegation of powers as far as in 1964, again in 1972 and more recently in 1977 to suit the demands of the growing size and diversity of its operations and to facilitate quicker decision making. The structural reorganisation of the Bank and the resulting decentralisation and delegation have also enabled

us to combine the advantages of size with purposeful and effective involvement in local development. In fact, from our experience, it would be quite in order to say that the hazards and difficulties of developmental banking, especially those of rural finance, are best faced through the resources of large banks with suitable organisational innovation for control and delegation.

It would not be out of place here to draw attention to some significant data. The market share of your Bank in the deposits of all scheduled commercial banks improved from 20.4 per cent in June 1969 to 24.0 per cent in December 1978. The share of priority sector advances in the total advances of the Bank went up from 18.54 per cent in June 1969 to 32.26 per cent in December 1978. While the advances to priority sectors have recorded a more than eight-fold rise, the number of persons assisted has increased 65 times indicating the Bank's concern for the small man. Innovations like village adoption, Agricultural Development Branches, scheme of Integrated Rural Development, liberalised scheme of financing small industries, the scheme for assisting technically qualified entrepreneurs, special Entrepreneurial Development Programmes, free technical consultancy services and a sizeable Research and Development Fund and an Equity Fund, have enabled us to improve our service to the weak and the needy both in qualitative and quantitative terms.

There are also many other important advantages of size. To spell out a few, I may mention the area of international banking where, over the last few years, we have established our reputation and prestige, our financial strength and resilience, in addition to our wide network of offices, have made it possible to have the State Bank's name and commitments accepted all over the globe. We have thus been able to mobilise resources in the international markets on the best possible terms for meeting the country's diverse requirements. Again, our size has helped us to develop common services like computer facilities and management information systems, and to reap the advantages of economic and statistical research, organisation and methods, management science, etc. All these are necessary inputs for dynamic banking in a developing economy.

The quality of customer service is a problem of the banking industry as a whole and not one related to the size of any bank. We are well aware of the problem and have initiated a number of measures to overcome it. The measures include implementation of the recommendations of the Working Group on Customer Service in Banks, improvement in systems and procedures, and training and orientation of staff. We have every hope that with a greater degree of cooperation and involvement of all sections of the staff, customer service in your Bank will be further improved.

Banks and Employment

The draft Sixth Plan envisages the creation of employment opportunities of the order of 49.26 million person-years. In this task, banks have been assigned an important role for providing credit to bankable schemes. Targets have also been fixed by the Government for providing assistance to self-employment ventures by each bank office.

Banks have been fully alive to this vital problem and have taken a number of measures to improve their lendings under the employment-oriented schemes and the Half-a-Million Jobs Programme. These schemes which aim at promotion of self-employment in agriculture, small and village industries and small business, have achieved a fair measure of success. To illustrate, at the end of 1978, the number of accounts of the State Bank of India under the Employment-oriented Shemes stood at 12.2 lacs with outstanding assistance of Rs 408 crores. The number of persons employed in activities financed under the schemes was 16 lacs. These statistics refer to units directly financed by the Bank, but the extent of overall employment created would be of a greater magnitude if we take into account the multiplier effect of the activities generated through the working of assisted units.

The problem of unemployment and destitution is a multi-dimensional one and has to be tackled systematically in all its aspects; credit support from banks is just one of the important inputs. The other aspects are those relating to identifying potential entrepreneurs, motivating and training them to take up self-employment ventures, preparing bankable projects suited to the capabilities of the entrepreneurs, and providing them with support in areas of production, management, marketing, etc. It is our experience that the viability of many of the schemes submitted to the banks would depend on a suitable package of inputs, application of proper technology and appropriate grass-root organisation to implement them; but these are often wanting. Banks have initiated some promotional measures and among those initiated by your Bank, as I have mentioned earlier, are the Equity Fund, the Entrepreneurial Development Programmes and free consultancy services. Having regard to the dimensions of the problem, however, it would be difficult for banks alone to achieve significant results. The Working Group on Role of Banks in Promoting Employment has identified the specific areas where banks' efforts would have to be supported by other agencies. Such supportive action would call for a concerted approach on the part of all the concerned agencies, namely, the Central and State Governments, the various corporations and bodies engaged in developmental work and the financial institutions. I suggest that a suitable machinery, preferably at the State level, be set up wih a view to achieving co-ordination, removing bottlenecks, if any, and continuously monitoring the progress in the implementation of the Working Group's recommendations.

I would like to touch on another related problem which needs attention. Under the various measures taken by the agencies connected with promotion of employment opportunities, a number of industrial units are set up with credit support of banks. The quantum of employment generated is at present assessed on the basis of number of such units started without due regard to their mortality rate. When a self-employment programme which generates expectations fails, its adverse impact is significant in that it becomes a demotivating factor both for the banks and potential entrepreneurs. Further, the cost to the society of industrial units which fail is also high. There is, therefore, an imperative need for providing new industrial units with assistance on a continuous basis by all the concerned agencies. In my view this kind of nurturing should receive priority in the policy and programmes of developmental agencies.

The problem of rural unemployment is of great importance and its solution lies mainly in diversification of activities through promotion of minor irrigation, allied agricultural activities, rural industries, etc. Your Bank has been laying special emphasis on providing financial support to these activities which generate additional employment opportunities both for the unemployed and the underemployed. The target groups for these activities are the small and marginal farmers, landless labourers and rural artisans. The approach so far

adopted in this area being largely sectoral in nature, without provision of proper backward and forward linkages, it did not produce the desired impact on employment generation. In this context, the new approach towards integrated rural development through block level planning with focus on employment is a welcome move. I would take this opportunity to commit our full support to the success of the programme not only in our lead districts but also elsewhere.

Staff

I believe that the real inner strength of a dynamic organisation like ours lies in its staff resources. We have, accordingly, been laying great emphasis on increasing the involvement of the staff in achieving our corporate goals by endeavouring to create an environment in which they take increasing interest in our social obligations and improve their contribution to the growth of the organisation.

The noteworthy progress made by the Bank in various spheres, especially in discharging its developmental role, would not have been possible but for the sustained and dedicated involvement of its large and talented workforce. During the year, the staff continued to display commendable zeal and enthusiasm in implementing the objective of helping the weak and the needy through imaginative and innovative schemes in keeping with our high traditions. I have great pleasure in placing on record, on behalf of the Board and on my own behalf, our sincere thanks and appreciation to the staff for their fine performance.

Changes in the Board

It is with deep regret that we have to record the death, in January 1979, of Shri R. P. Tamta, Member of our Kanpur Local Board.

The concept of workers' participation in management was given a concrete shape in the Bank in 1978 with the nomination of one representative each from officers and workmen staff on the Central Board. I welcome Shri R. N. Godbole and Shri N. C. Choudhury who joined our Board in April 1978 representing officers and workmen staff respectively.

Tube Investments of India

TUBE INVESTMENTS OF INDIA's public issue merits attention of genuine investors. The new shares are being issued at par, though the book value of the ten-rupee share is Rs 23. Moreover, the subscription list will open on April 16, but the new shareholders will participate in the final dividend for 1978 which is to be announced after allotment of shares under the public issue. The company has already paid six per cent by way of interim dividend. It has good past record in performance and dividends. It has paid 10 per cent equity dividend continuously for the past 20 years. Despite the closure of the cycles division for nearly 9 months, it has shown better results for 1978 due to improved performance of other units. Although sales were lower at Rs 21.51 crores, against Rs 26.07 crores in 1977, gross profit was higher at Rs 2.66 crores against Rs 1.91 crores. Since its reopening in the last quarter of 1978 after a productivity-linked payment agreement with workmen, production at the cycle division has improved substantially. The order book position is good and the tube, strip and metal section units are also performing well. It can, therefore, be expected that the company will be able to pay reasonable dividends on the enlarged capital. Meanwhile, the company has undertaken a project to manufacture 'Z purlins' at Avadi near Madras where its engineering complex consisting of cold rolling mills, ERW and CDW tube mills and metal section units are located. Z purlin is a structural member, fabricated of CR strips and used by the construction industry for roofing of sheds used as warehouses, factory sheds, community centres, etc. The company will have an installed capacity of 6,000 tonnes per annum. Production is expected to commence by early 1980.

Masterpieces inspired by Indian Dyes

MADHUBANI

Paintings in the characteristic Madhubani style are today much sought after all over the world Loose-limbed, exaggeratedly vertical figures almost naively drawn, but nevertheless with a reserve of strength in their forms dominate the compositions Foliage and flower are stylized and elaborated into extended decorative patterns

In Madhuban and its neighbouring villages in the southeast of India this style of painting was used traditionally for murals on the outside of huts Today the designs are being adapted on fabric and paper

The Madhubani murals were executed only by women who obtained all the colours used from natural sources Sensuous scarlet and deep sienna from the Kusum blossom, bright yellow from turmeric soft gold from a compound of banana leaf juice, milk and lime rich black from encaptured smoke, these were then mixed with goat's milk and Bakul tree gum as binding media

Indian dyes have come a long way since then

Today Atul Products produces a wide range of Synthetic Dyes which help colour everything from fabrics of cotton, jute, wool, art-silk, and man-made fibre, to leather and paper

Atul also produces Dye Intermediates to help make Synthetic Dyes, and Optical Whitening Agents which make whites look whiter.

Wherever there is colour, there is a dye Atul makes some of the finest man-made dyes.

THE most notable thing about the Committee on Industrial Licensing, copies of whose report have been printed and circulated "with compliments from the Convenor and Members" of the Committee, is that it had not been, to begin with, a Committee on Industrial Licensing at all. The Committee was appointed by the Minister of Industry in October last year to (a) review the existing *procedures* relating to grant of letters of intent/industrial licences, approvals for foreign collaboration, import of capital goods, registration with DGTD, etc; and (b) suggest ways and means of improving these *procedures* to eliminate avoidable delays and to make recommendations in this regard. The terms of reference of the Committee clearly did not permit it to pronounce upon the desirability or otherwise of, and make recommendations about, the government's policies and objectives in regard to industrial licensing and a whole host of related matters. However, this is precisely what the Committee has done. At no point after the Committee's appointment were its terms of reference formally enlarged, though the convenor of the Committee claims in his letter of transmittal to the Minister of Industry that the Committee had extended the scope of its enquiry "thanks to the encouragement given by you and your senior officials".

What lends special significance to this whole episode is, of course, the composition of the Committee. As originally appointed, the Committee consisted, with one solitary exception, entirely of industrialists, the majority of them from large Indian business houses and multinational corporations. Within a few weeks, the sole non-industrialist member resigned, leaving the Committee completely homogenous in its composition. At the beginning of its report, the Committee expresses its belief that "government, in appointing it, has, in fact, recognised the immense contribution that liberalisation in industrial licensing can make towards rapid economic growth . .". This belief may have some basis, but it would be no less true to say that the way the Committee nonchalantly enlarged its own terms of reference reflects the confidence of businessmen and industrialists that the government is just now especially amenable to pressure to modify its economic policies.

The setting up and rapid growth of a whole range of low priority industries, the continuance and worsening of regional disparities in industrial development, the minuscule growth of industrial employment and the accentuation of concentration of economic power, to mention only some of the outstanding features of the pattern of industrial development in the country should leave no room for any residual optimism that the government's economic policies can achieve the goals set for them. So no tears need be shed over the fate of these policies. The only reason for critically viewing demands for their relaxation and dilution, such as those made by the industrialists' Committee, is to get an insight into the thinking of businessmen and industrialists on economic issues and the relationship they would like to see prevail between industry and government.

The Committee expresses the hope that its report will not be construed as recommending a state of *laissez-faire*. There is no danger of such a misunderstanding arising. In fact, the best way of summing up the Committee's report would be to say that it would like business and industry to have the best of both worlds. On the one hand, it would like industry to be left free to pursue profit maximisation untrammelled by any attempt to regulate industrial investment and production according to any considerations of social desirability or priority. Hence the recommendation that projects with "value of assets" upto Rs 15 crores should be exempt from licensing. That should make it possible for most luxury and semi-luxury goods industries to be set up and expanded without the formality of seeking government approval. On the other hand, in respect of industries still subject to licensing, it is recommended that the Ministry of Industry and the concerned administrative ministries should commit themselves to growth targets for each financial year in advance. Once they make this commitment, the Committee hopes, the concerned administrative Ministry will become, in the interests of achieving the target, "an active instrument in chasing industrial licences sought by applicant companies". Though the Committee does not say this explicitly, it is no doubt its hope that, in addition, the Ministry will also lobby for lower excise duties, larger export incentives, more liberal finance from the financial institutions, and so on. The Committee also recommends an active role for the Development Councils for different industries, composed jointly of representatives of government and business and industry, but invariably with the latter in a majority. Such is the closer collaboration

between industry and government envisaged by the Committee, in the interest of faster industrial growth.

The snag, of course, is that all this, while undoubtedly making for larger freedom and profits for business and industry, may still not result in a higher rate of industrial growth. The reason is that the Committee's basic proposition that the low rates of industrial growth in recent years have been on account of the rigours of the licensing system is false. In fact, since the beginning of the seventies there has been a spurt in the number of licences issued every year. The number rose from 1,420 in 1969 to 6,032 in 1974 but what has been the impact of this on industrial investment and growth of capacity and production? Further, if the Committee is to be believed, the main victims of the licensing system have been the large business houses. However, every time this question has been systematically probed in the past — for instance, by R K Hazari in 1966 or later by the Dutt Committee — it has been shown that far from being starved of licences the large business houses have managed to secure licences without any intention of implementing the projects in question, purely to pre-empt licensed capacity and protect their oligopolistic positions in the particular industries. This is perfectly rational, profit-maximising behaviour on the part of industrial units in an economy where oligopoly and concentration of market power are the rule. In such conditions pursuit of profits by business houses will as often as not take the path of manipulation of prices and supplies and prevention of competition and shutting out new entrants into the industry. The climate for successful manipulation of this type should on the whole improve further with the closer collaboration between business and industry and the government recommended by the industrialists' Committee.

Politics

Uses of Religion

THE surest way of keeping the system going in India is to have the oppressed at each other's throats; and what better way can there be of ensuring this than having a communal riot at fairly regular intervals?

Thus, in Jamshedpur, the annual recurrence of a festival; a religious procession which insists on taking a particular route because other people living in that area would not want the procession with all its aggressive noise in front of a 'place for worship'; ditherings on the part of the civil administration which, after vowing that it would never allow such a provocative gesture on the part of the 'majority community', finally allows it to be made; brickbats and other missiles thrown at the tailend of the process which, miraculously, never cause any serious damage to the processionists but which invariably lead to instant and widespread 'retaliation' which goes on uninterrupted for two to three days during which many people are killed, many women dishonoured, and much property looted and burnt, before the administration announces that it is taking 'firm action' to control the situation; curfew, relaxation of curfew, and more killings; calling out of the army; visits by VIPs and anguished statements by the dozen; mohalla peace committees and relief camps; charges and countercharges and threats of resignation by ministers; and, finally, inescapably, the appointment of a judicial commission of inquiry whose report, when submitted in good time, is as inevitably going to be put away on the shelf — till the whole exercise is gone over again when a fresh wave of killings begins on the occasion of yet another birth anniversary of Lord Rama or Lord Krishna.

There is indeed nothing unique about the killings in Jamshedpur; it is yet another instance of the organised attacks against the national minorities that has continued under both the previous and present dispensations; some of the most horrible killings of Muslims took place under the regimes of Jawaharlal Nehru and Indira Gandhi. In fact, even while using every outbreak of communal violence to shed crocodile tears in sympathy with the Muslim community, both wings of the Congress party have also been opportunistically supporting that most reactionary and patently Hindu communalist demand for a total ban on the slaughter of cows of all ages and descriptions.

Which brings one to Vinoba Bhave, that selective conscience-keeper of the nation, who even as the killing of Muslims is taking place in Jamshedpur, has not merely not said a word about them, but is on the point of engaging himself in a task which holds the prospect of further intensification of communal antagonisms. The demand for a ban on the slaughter of cows is not merely misconceived and mischievous but is also hypocritical in that this demand is sought to be justified on allegedly sound principles of animal husbandry and dairying.

What is sickening about the threatened fast by Vinoba Bhave is that the leaderships of all political parties seem to be holding their breaths in fearsome anticipation of what the future would hold if the sarkari swami at Paunar really goes ahead with his fast and dies in the process. This is plainly an impossible situation. It is open to the government to arrest anyone who seeks to go on a fast unto death in public on cognisable charges spelled out in the Indian Penal Code and the government has arrested people in the past who threatened to undertake coercive fasts. But the government's conscience too in the matter of such fasts has always been selective. What is deplorable is that even the chief ministers of Kerala and West Bengal have allowed themselves to be overwhelmed by the threatened prospect and have failed to address themselves frankly and forcefully to the basic issue involved in the question of a ban on the slaughter of cows of all ages and descriptions — that the demand is clearly a communal one, that it seeks to impose cultural and religious prejudices and food habits of a section of the Indian people over others who do not share them, that to pretend that the demand is acually dictated by principles of animal husbandry is the crassest kind of hypocrisy.

Clearly, such demands seek to further sharpen differences among the people to the advantage of the ruling classes. It is difficult as it is to unite the masses on basic economic and class issues, and the unity achieved over years of common struggle so often seems to breakdown at the first instance of communal tension. Jamshedpur itself, an industrial city with a history of organised working class struggles, provides a telling instance of such fragile working class unity.

Paper Industry

Facade of Control

NO less a person than the Industry Minister himself has begun to issue 'stern warnings' to the paper industry about its failure to arrest the 'spiralling prices' of paper. This is not the first time such warnings have been issued. Along with warnings, there have been also promises of other measures to control and regulate paper prices — it has been said that government would import 75,000 tonnes of

paper, [illegible] to eliminate the nexus between manufacturers and agents which, as is widely known, is at the root of the organised blackmarketing that exists in the paper trade, that it would enforce the provisions of the Paper (Regulation of Production) Order, 1978; that it would bust the racket of 'new nomenclatures' by which device creamwove paper becomes 'optically bleached creamwove' or 'super bleached creamwove' or 'jumbo creamwove' and is promptly sold at much higher prices, and that it would limit production to the one or two most widely used varieties of paper and import the other kinds.

None of these promises, or even 'threats' are new; and yet the paper industry, while being unrelenting in its attacks on the requirement that binds mills with an installed capacity of 25 tonnes or more per day to produce 'white printing paper' to the extent of at least 30 per cent of its total production and further to sell this paper at the rate of Rs 2,750 per tonne to the DGS and D and recognised educational institutions, has also perfected a wholly profitable way of functioning even as it seemingly conforms to these requirements. First of all, it is doubtful if the requirement that paper mills produce a certain amount of white writing paper and sell it at a fixed price to recognised agencies has ever been enforced. The requirement has however been a rather welcome 'restrictive' measure for it has provided industry with a permanent grievance which can be, and has been, used to extract many other kinds of concessions. Admittedly, the selling price of this white printing paper to recognised agencies is considerably less than the cost of production, and the so-called black market — that is, open market — prices are almost double this official price. But the very fact that such a black market flourishes suggests that the required amount of white printing paper is not manufactured and that the 'official' sale of even what is manufactured is inevitably tied up with the long-standing alliance of paper manufacturers and traders — so much so that even the government, the largest consumer of paper, has to take recourse to special imports if not actually enter the black market. Further, the 'punitive' requirement is not without its advantages, since it allows industry complete freedom to fix prices of other qualities of paper. Out of a total production of a little over nine lakh tonnes, only two lakh tonnes are at present officially expected to be available at the predetermined price. Industry can thus make a killing even while groaning and moaning about the burden of the 'punitive' requirement.

It is not as if government is unaware of these practices: they have all been extensively reported and commented upon even in newspapers. If the paper industry is nevertheless allowed to constantly gripe about the allegedly punitive requirements imposed on it and at the same time make good profits by seemingly adhering to such requirements, it has to be because of government's own accommodation to such a mutually advantageous arrangement.

Nuclear Policy

With Soviet Encouragement

Mohan Ram writes:

THE US decision to stop economic aid to Pakistan on the grounds that it is setting up nuclear facilities which can be put to military uses confirms the Indian assessment that there is going to be an 'Islamic Bomb' in the near future. But official reaction has been limited so far to explaining why India did *not* accept the Pakistani proposal for a multilateral declaration against non-acquisition of nuclear weapons by Pakistan, India and some other countries. The proposal had been made in Zia-ul-Haq's reply to Morarji Desai's letter, parts of which were leaked after the US had decided to stop economic aid. Indian rejection of the proposal, to go by 'informed opinion' in New Delhi (euphemism for official sources who do not want to be quoted) was based on its understanding that Pakistan is making an Islamic bomb and not a Pakistani bomb. Oil-rich Arab countries who have been underwriting the Pakistani programme have all the more reason to continue their assistance after the Egypt-Israel pact. The Islamic bomb is supposed to be a deterrent against a Israeli nuclear arsenal made possible by clandestine shipment of fissile material from the United States. India is not the sole factor in Pakistani calculations behind the bomb move. Zia's letter (to go by the leaked excerpts) also points out that India is going ahead with plans for a bomb and that having carried out the Pokhran test India cannot argue against Pakistan going ahead with its own nuclear explosions.

Zia's suggestion for mutual or multilateral inspection of each other's nuclear facilities is seen by India as a trap, a plan by proxy for full-scope safeguards that the US is insisting upon. The Indian view is that if what Pakistan is going ahead with is an Islamic bomb, a joint declaration or inspection programme would make little sense because the bomb could still be developed and exploded in, say, Saudi Arabia while, technically conforming to the requirements of a nuclear free zone in South Asia.

A fall-out of the Pakistan nuclear programme has been renewed US pressure on India to accept full-scope safeguards. The US argument is that Pakistan can be dissuaded from making the bomb only if India accepted such safeguards. In this context, it is worth recalling two recent statements by the External Affairs Minister. Early in February he had told an interviewer that India had not foreclosed its weapon option for all time to come. About a month later he told Parliament that the decision on the nuclear option would be under constant review depending on Pakistan-Libya moves for a bomb. Morarji Desai might seek to explain away these statements, which contradict the repeated official assertions that India will never make a bomb, as the personal views of the External Affairs Minister; but such an explanation will carry little conviction.

It is also possible that there is tacit Soviet support to India keeping its nuclear weapons option open. For instance, during his recent visit, Kosygin did not refer even once to the non-proliferation treaty; instead, there was the Soviet offer of nuclear co-operation, albeit for 'peaceful' purposes.

What is even more significant is the stepped up Soviet campaign about Chinese encouragement and help for Pakistan's bomb, though India itself does not have any information on it. Soviet propaganda has been suggesting that the main encouragement to Pakistan's nuclear designs is from China and not from the Islamic bloc that is emerging with the disintegration of the CENTO and the collapse of the Shah regime in Iran. This bogey of a Chinese nuclear threat to South Asia (even if Pakistan did not make the bomb) is being built through inspired reports in the Indian Press. In the Soviet calculation, an Indian bomb is the only deterrent to China's nuclear threat to South Asia.

In the past, India had expected the world to accept its word that while its nuclear programme was entirely 'peaceful', there was no question of its signing the NPT or accepting full-scope safeguards because they were discrimi-

natory. Now, if Pakistan says the same thing, India cannot take exception either.

It is now virtually impossible for India to accept full-scope safeguards as the price for Tarapur fuel. But the question is: will India reopen its bomb option because it is assumed that Pakistan will carry out its first explosion, if all goes according to plan, in two to three years? In suggesting an India-Pakistan joint declaration, the United States might have been trying to forestall a Pakistani bomb; but if it is going to be an Islamic bomb, there is little the United States can do. Stoppage of economic aid is no deterrent and even getting India to accept full-scope safeguards would not prevent such an Islamic bomb. If a Chinese bomb was no reason for India to reopen the bomb option, can an Islamic, or even a Pakistani bomb, be one? The encouragement for a possible Indian bomb has thus come, so far, from only one quarter — the Soviet Union.

Cotton

Contrary Pulls

THE 1978-79 cotton season has entered its eighth month. Before the season began, cotton growers had started campaigning for high support prices in view of the very high carryover stock and the prospect of bumper production.

The first forecast of the current season's crop shows that area under cotton has increased by 4 per cent. Calculating on this basis, it can be stated that the crop will be about 7.2 million bales or more, though it is unlikely to exceed 7.5 million bales. The best estimates put consumption at 7 million bales. This means that stock will increase further.

As a result, the demand for a ban on imports and maximisation of exports has gathered momentum. In addition, pressure was put on the Reserve Bank to permit liberal credit to both the textile industry and the cotton trade. In 1976-77 and 1977-78 exports of cotton were negligible. Imports of cotton on the other hand, had soared to 8.20 lakh bales in 1976-77 and were still substantial at 3.80 lakh bales in 1977-78. Even at present the textile industry is pressing the government to permit imports of good quality foreign cotton.

The marketing season starts — in November and reaches its peak about February-end. Prices, which had receded by 3 to 4 per cent by the end of October 1978 had fallen further and faster by March 1979. According to trade estimates, by February-end 4.86 million bales had arrived in the market, i e, 6 lakh bales more than in the corresponding period of 1977-78. *The Economic Times* index of cotton prices had declined from 200 in March 1978 to 175 in March 1979. With market arrivals ebbing, the index rose 13 points to 199 on April 2. From now on prices should be expected to move in a much narrower groove. At the moment of writing, traders and growers are unwilling to sell in expectation of a higher price during the remaining months of the season, while purchasers are hesitant to enter the market which is expected to fall.

West Germany

Providing for Egypt

Ramesh Jaura writes:

DESPITE mounting domestic and foreign pressure to provide massive economic aid to help Egypt steer clear of the economic and political consequences of the threatened total boycott by Arab states, West Germany is not willing to go it alone. In talks with President Sadat, who visited Bonn towards the end of March, Chancellor Schmidt left no doubt that West German aid would be in conjunction with its western European allies, the US and Japan.

With both France and Great Britain unwilling, the lion's share of such aid from within the EEC will, however, have to be borne by West Germany. Western aid which Egypt expects amounts to as much as 15 billion dollars stretched over a period of five years. This would mean that Bonn alone will have to give something between three and five billion dollars.

At present, despite being the second largest recepient of West German concessional aid, Egypt does not receive more than 250 million DM annually. West German assistance includes training of scientific and technical personnel as well as aid for agriculture development. Particularly in the latter, experts belonging to the state-owned German Agency for Technical Co-operation (GTZ) are engaged.

West Germany has in fact earned a good reputation in Egypt, and a former West German finance minister has been acting as a special adviser to the Egyptian finance ministry. A member of the ruling SPD, Alex Moeller, now heads the so-called Egyptian lobby in West Germany which pleads for giving as much assistance to President Sadat as possible.

While West German aid to Egypt may exceed the present level of 250 million DM, it is unlikely it will ever amount to three to five billion dollars. West Germany will find it difficult to provide even one billion dollars, for the money is just not there. Bonn has already taken upon itself the task of co-ordinating western aid to Turkey in which the West German share is likely to be anything between 800 million and one billion DM.

It would however be wrong to believe that lack of funds is the only reason why Bonn is not in a position to respond to Cairo's expectations. Being prone to terrorist attacks, West Germany fears reprisals if it were to go all out to assist President Sadat. Hence Bonn's insistence on a comprehensive solution to the Palestinian problem.

In asking for a comprehensive solution, Chancellor Schmidt is not only backed by the EEC resolution but also feels himself strengthened by UN Secretary-General Kurt Waldheim. Two days after the peace treatey was signed in Washington, Waldheim addressed a press conference at Bonn where he expressed his scepticism about the agreement which does not involve all the parties to the conflict. He went even a step further, proposing a multilateral, Geneva-type solution.

Another reason for caution on the part of West Germany is the country's heavy dependence on oil imports from the Arab countries which have joined the boycott against Egypt. The need to ensure imports to meet the domestic energy demand has been further highlighted by recent developments in

Iran. [illegible] in view that Bonn has been playing a notable role in promoting the Euro-Arab dialogue.

An equally important reason, is Bonn's keenness not to strain its relations with the Soviet Union which has unequivocally condemned the Egypt-Israel accord. This has to be seen in the context of current controversy in West Germany on the country's role in safeguarding detente and peace in Europe and the world. It is also possible, that Chancellor Schmidt does not want to oblige President Carter, who played a crucial role in the peace agreement, by taking upon himself a responsibility which usually rests with a big power.

LETTERS TO EDITOR

Mess in Coal India

THE scandalous state of affairs in Coal India and its subsidiaries is seen from the fact that, in spite of a colossal capital outlay of about Rs 600 crores during the last three years, annual coal production has remained at a static level of 89 million tonnes against ever increasing demand. As a result, a whole spectrum of industries — steel, power generation, textiles, cement, etc — have been seriously affected During the first three years of nationalisation production went up from 70 to 90 million tonnes with a capital outlay of Rs 311 crores. The total capital outlay on Coal India today stands at a colossal Rs 900 crores The cumulative losses of Coal India also stand at about Rs 400 crores against an authorised share capital of Rs 750 crores.

In order to prop up sagging morale, especially at the top levels, it has now become customary for Coal India to claim record production at the end of each financial year, which is done by inflating or over-reporting production Last year S C Verma, Secretary, Ministry of Energy (Coal), had warned chairmen-cum-managing directors of all the subsidiaries of Coal India against such unethical practices. Yet it appears that this practice continues.

Monthwise production statistics of the pre-nationalisation period show that once production was increased it was maintained and seasonal variations in production were minimal. By contrast, Coal India's production statistics for the last four years show erratic variations. Most interesting, after reaching record levels of production in March each year, there is a steep drop in the following month. This drop in production was 2.25 million tonnes in 1976, 2.01 million tonnes in 1977 and 2.28 million tonnes in 1978.

Coal India's average productivity is about 0.65 tonnes of coal per man shift. Going by this, to increase coal production by about two million tonnes per month, it would require an additional manpower of about 1,20,000. CIL's statistics do not show this. On the contrary, it is found that the total strength of workers (Wage Board employees) has come down by about 42,500 in the last three years, out of which the drop in the last year alone was more than 20,000

It is apparent that the present management of Coal India is not capable of meeting the country's requirements of coal or creating new employment opportunities or safeguarding the capital outlays. Such a state of affairs would not have been tolerated anywhere else, but in this country critics of inefficiency in the public sector are promptly dubbed as opponents of nationalisation and stooges of the private sector. About two years ago I had warned in my book "Save Coal India" (Satyameva Jayate Publications, Polo Grounds, Chindwara) that the autocratic and bureaucratic administration of Coal India, with technical and managerial incompetence at the top levels, was leading the coal industry to ruin and that there would be a coal famine. All of this has come true today.

The seriousness of the situation can be seen from the fact that in the last year 2,300 MW of new thermal generation capacity has been added over the whole of the country. If this additional capacity is to be fully utilised an additional 10 million tonnes of coal will be required for power stations alone, apart from the fact that many new cement, chemical and other plants are about to go on stream, which in turn will raise the demand for coal. All this demand can be met only if Coal India maintains a steady production of over 9 million tonnes per month, that too in every month of the year, and produces 110 million tonnes of coal this year.

This is impossible considering the present state of affairs in Coal India. Instead, to mislead public opinion, almost all the subsidiaries of Coal India, except Western Coalfields, have started claiming that in view of the unmanageable build-up of coal stocks they will be curtailing coal production from April onwards.

DVC and Flood Control

THIS has reference to the article "DVC and Flood Control" by K V Subrahmanyam (November 11, 1978). The article was in the context of the 1978 flood in the DVC system, which was the record flood since the inception of the system. The writer seems to have confused issues relating to water management and is misinformed about what happened on the crucial occasion. The dams at Maithon or Panchet were not full to the brim at the time of arrival of the flood waters. There was also no resort to panicky discharge of the waters stored behind the dams at any stage. When flood waters started coming into the reservoirs, the levels were lower than even the normal planned storage levels and discharge was effected following predetermined guide curves. The guide curves have been worked out years earlier and approved and adopted after thorough technical examination and discussion among the technical experts of the participating governments.

The DVC dams were planned and constructed as multipurpose dams and they are being operated as such. The suggestion that the dams should be treated and operated as only flood-control dams will hardly be acceptable to anybody. For multipurpose dams like those of DVC, if the water is not stored to the predetermined level when it is available, other planned benefits like supplying irrigation requirements, meeting the demand for domestic as well as industrial use, maintaining draft for navigation and meeting the requirement of hydel generation cannot be secured. In any integrated system of power supply, hydel power is essential to stabilise the system load and cannot be abandoned.

Dy Chief Engineer (C)
DVC, Maithon

Bhutto and After

Romesh Thapar

FOR how long will the politicians of the world, and the subservient press linked to them, keep us hooked on sentimental stories about Zulfikar Ali Bhutto? The facts which are highlighted do not capture the sordid record of Bhutto, the power-wielder, or of the psychopathic fanaticism of General Zia-ul-Haq, Pakistan's martial law administrator. The horrendous killing of Bhutto, who was himself a savage politician, is projected in such a way that the trauma of Pakistan hardly gets across.

From all accounts, the people of Pakistan suffered grievously under Bhutto despite all the populist propaganda about a brilliant man devoted to the poor. Anyone who bothers to uncover the sordid story would realise that in comparison Indira Gandhi and her son were angelic during the long months of Emergency. Taking a Pakistani view, Bhutto was perhaps the only politician who was able to challenge the regime of the generals now hiding behind the Koran. After his hanging, even if elections are held, there seems no prospect of any coherent politics, let alone the structuring of political formations. The country is at the mercy of a Punjabi-dominated military establishment which is fast losing its credibility.

Religious Charlatans

The killing of Bhutto, for that is what such 'judicial' hangings amount to whether in Pakistan or in Iran, puts a question-mark over the stability of the State and its capacity to make a transition to a more sensitive, federal polity — for General Zia's Islamic aberrations can be no alternative to the frenzied populism of Bhutto. The people of Pakistan are deeply troubled that all manner of religious charlatans might be gathered by a double-talking, compromised military machine to impose a backward-looking regime on the country. For the first time, Pakistanis are able to look upon India's experiments in democracy without the usual blinkers — and Indians are able to share the anguish of Pakistan.

This re-discovery of each other has to be cultivated with great care on both sides of the border, and at a time when the US for its own purposes is again viewing Pakistan as an important military pawn in the drifting politics of the Islamic world (and that despite the symbolic aid-cutting over nuclear developments). We have to employ every persuasion to prevent a renewed arming of Pakistan, and at the same to reassure the people of Pakistan that India is terribly serious about a no-war pact. Our effort in both directions is listless. We underestimate the speed with which situations can be transformed, distorted and twisted.

The destabilisation of Pakistan is to be fought whoever rules in Islamabad. It has to be fought directly and otherwise. We need to make careful assessment of all that we can do to reduce the despair of the people of Pakistan — and this remedial action covers a wide field, from the abolition of entry visas for Pakistanis visiting their families in India to trading agreements which may for sometime favour Pakistan. A wait-and-see attitude at this critical juncture is tantamount to abandoning Pakistan to Islamic guerillaism and opportunist international alliances with serious spill-over effects on the sub-continent.

It is strange how a global reaction is orchestrated on the Bhutto trial and hanging, and no protest worth its name develops around the effort of various Islamic juntas to impose seventh century 'legal' systems in the name of the Prophet. The brutality inherent in public floggings for legal offences, and in chopping off fingers and hands for thieving cannot but open these societies to larger brutalities. Postures on human rights do not seem to be very pronounced when mixed up with oil politics. Even the antics of Pakistan's rulers are slurred over in the context of Islamisation.

Fight Revivalist Trash

India, very much a part of the so-called Muslim world and responsible for a Muslim population as large as that of Pakistan, cannot behave as if it has no interest in the reactionary trends which are making themselves visible from Morocco to Indonesia and the Philippines. The influence of India must be asserted in the struggle for the modernisation and enlightenment of the Muslim world, or else we will give comfort to the propagators of revivalist trash in our own country — a development with repercussions on all communities, particularly the exclusivist and conspiratorial sections of the Hindus. We seem at the moment only interested in the gains, political and economic, which opportunism brings.

Crisis of Muslims

The crisis of the Muslim communities can only be tackled effectively if Muslims themselves begin to challenge orthodoxy. India, which has seen so many changes, should set an example. The women of Teheran demonstrating without *chadars* in their thousands, the women activists for the liberation of Palestine, the newly educated and emancipated women working for the development of their countries, and the leaders of this upsurge, cannot be marched back to the days of tribal feudalism. If that goes for the women, where do the men stand? It is ironic that in free India the Muslims who have been used as secular decoration have seldom battled for the modernisation of their community. This neglect of a fundamental aspect of social reform has made of the Muslims a second layer of untouchables.

Maybe, the Bhutto episode in Pakistan will provide the shock that the Muslims of the sub-continent need to push them to seize the opportunities of today: to educate themselves beyond religious texts, to mobilise beyond the community and to advance. The rise of Bangladesh destroyed the mystique of the Partition. The present plight of Pakistan may heal old wounds and nurture a new and more equal friendship on the sub-continent. Islam in South and South-East Asia could develop interesting momentums in harmony with the search for identity in modernisation. But, whatever the currents and cross-currents, India has to begin the business of underlining its commitments with greater energy and clarity.

April 7

Labour Problems, but Doing Well

Hansavivek

MAHINDRA AND MAHINDRA has stepped up dividend by 3 points to 18 per cent on the increased capital resulting from the merger with it of International Tractor Company of India. The financial results are for both units as after their merger which became operative from November 1, 1977. The tractor division had industrial relations problems during the first two months of the year. These were amicably settled and thereafter production and sales have been encouraging. Gross margins, however, have been thinned down considerably. Production and sales of Jeep vehicles improved from 10,568 and 10,609 units to 11,349 and 11,440 units, respectively. The tractor division produced 5,750 tractors and sold 5,866 tractors. The automotive division exported vehicles and spare parts worth Rs 3.25 crores. Against an order from Turkey for 1,250 tractors, the company could ship only 250 tractors before the end of the year on account of delay in establishment of an acceptable letter of credit by the customer. A further order for 1,500 tractors has been received from Turkey. Steel business handled by the steel division was slightly higher at 3,05,298 tonnes. Workmen of the Calcutta factory of the instrumentation division went on a stay-in strike from middle of August to early January last. During this period, there was complete stoppage of production and of despatches. In compliance with the directive of the government of Maharashtra, the instrument assembly operations of the electronics division were shifted from Bombay to Nasik. The machine tool division booked orders for Rs 106 lakhs as against Rs 126 lakhs in the previous year, but deliveries increased from Rs 69 lakhs to Rs 112 lakhs. The division is expanding its activities. It has acquired sales franchises for multi-spindle automatics, rotary surface grinders, centreless grinding machines, electro-discharge machines, environmental control machines, billet and slab grinding machines and hardness testing machines from various American, European and Japanese manufacturers. It also intends to enter the chemical field.

UNION CARBIDE INDIA achieved slightly higher turnover in spite of the initial loss of sales resulting from a 4-month-long suspension of operations at the chemicals and plastics plant at Bombay. But profit margins increased noticeably and gross profit expanded by more than a fourth. This was mainly on account of improved contribution from batteries, flashlight cases, arc carbons, and marine products operations. The unchanged 16 per cent distribution on an enhanced capital is adequately covered by earnings. The company is looking ahead to achieve further growth in the coming years. It expects the construction work on the second phase of the MIC-based pesticides project to be completed this year.

It has also undertaken a plant modernisation and expansion programme at the petrochemicals plant in Bombay which is estimated to involve an expenditure of Rs 4 crores. The work will be completed in stages in three years. The company is also actively associating itself with government in its plans to optimise the utilisation of off-shore gas. Meanwhile, research and development efforts are continuing in the development of new battery systems and definitive results should be available before too long. The research and development centre of agricultural products at Bhopal has standardised colonies of a few varieties of pests, which are now being used to screen new synthetic molecules for their bio-efficacy. Biological investigative work is also being carried forward for the registration of new formulations of pesticides. The company has already completed foreign equity dilution requirements under FERA. RBI has given it a certain amount of time in which to meet the relevant guidelines regarding the ratio of turnover in the high technology sector and exports *vis-a-vis* the non-core sector. The company expects to meet these guidelines. Since FERA became effective in the beginning of 1974, the company has invested Rs 33.73 crores in the specified areas — more than 76 per cent of its total new investment into designated areas of high technology and exports. The company intends to maintain this trend of relative investment through continued expenditure on the construction of the Bhopal pesticides plant and thereafter on other projects now under consideration.

DEEPAK NITRITE has once again come out with good results. Sales, profits as well as margins are higher than in the previous year. Dividend has been raised by two points to 14 per cent, which is covered 3.66 times. This performance has followed increase in production of sodium nitrite/nitrate from 7,466 tonnes to 11,109 tonnes and of nitric acid (dilute) from 7,712 tonnes to 7,747 tonnes. It could not utilise the higher installed capacity of the latter plant due to paucity of ammonia, the main raw material. The DNPT plant, restarted only in August last, after major repairs and installation of necessary equipments damaged by accidental fires, produced only 28 tonnes. The company's prospects for the current and future years appear promising. Full benefit of the concentrated nitric acid plant, commissioned in October last, will find reflection in this year's accounts. Moreover, additional machinery has been installed at the nitric acid (dilute) plant which would enable utilisation of licensed capacitiy of 18,000 tonnes. The company has also taken up implementation of the ammonium nitrate project. Efforts are being made to achieve higher production from the present plant of sodium nitrite/nitrate by providing balancing equipments. The company has obtained a 'letter of intent' for setting up a plant in Maharashtra for manufacture of 250 tonnes of ammonia per day capacity, based on associated gas emanating from Bombay High. Since the capital outlay for this project is estimated at Rs 35 crores, it is proposed to promote a new company of which Deepak Nitrite would be the chief promoter. The company continues to pursue its research and development programme. Based on the process developed on pilot plant scale, the company intends to take up the projects to manufacture nitrobenzene and aniline in the coming years.

LAXMI VISHNU TEXTILE has recorded significant improvement in its working during 1978 and has been able to reduce its accumulated loss from Rs 103 lakhs to Rs 70 lakhs. This outcome has followed record net sales of Rs 21.06 crores against the previous year's Rs 14.64 crores. The results would have been better if the company did not have to resort to conversion activity owing to shortage of working capital in the early part of the year. Trading conditions were better than in earlier years. Cotton prices ruled easy throughout the year, though the company had to use expensive imported cotton carried over from the previous year. Synthetic activity was carried on, on conversion basis, but from April 1978 the company has been manufacturing its own synthetic varieties. The financial institutions have sanctioned soft loans to the tune of Rs 1.82 crores for modernisation of machinery and equipment. SBI has also agreed in principle to grant a loan of Rs 1.56 crores for working capital. An agreement about wage revision effective from November last has been reached with the union. The agreement is valid for 3 years and provides for an increase of 10-11 per cent in wages. The full effect of this increase would be felt in the current year. R N Joshi, managing director, resigned from service with effect from October 31 last. B G Kakatkar has been appointed as an additional director.

ASIAN CABLES has installed a triple tandem extrusion line at its plant and commenced manufacture of cross-linked polyethylene (XLPE) cables. By making the first sales of these cables to the Kudremukh iron ore project in Karnataka in December last, the company has been able to avail of the appropriate income-tax relief for 1978. The 6-inch extrusion jacketing line is also being installed at the plant. The company has produced good results with higher output, sales and profits, even though it had to contend with difficulties in procuring adequate raw materials and restrictions on power offtake. Net sales have risen by 47 per cent to Rs 11.98 crores and gross profit is up by 80 per cent to Rs 1.38 crores, reflecting notable widening of margins. Total dividend has been stepped up by five points to 17 per cent and is covered 1.53 times. Exports have dropped from Rs 3.73 crores to Rs 1.63 crores but home demand, particularly for power cables, was higher.

PRESSURE COOKERS AND APPLIANCES is faring well in the current year. Its turnover during the first 5 months ended February has been 56 per cent more than in the same period last year. While it may not be possible to sustain this high rate of increase in turnover, the company expects to achieve satisfactory overall result in the current year. In the light of the current performance, the board is considering declaration of an interim dividend. Meanwhile, two recent developments tend to restrict the company's future growth. The Industries (Development and Regulation) Act, which has been passed by both the houses of parliament, seeks to bring presesure cookers under the first schedule to the Industries (Development Regulation) Act, 1951. Under the present law, the company is not required to apply for an industrial licence, as the value of land, buildings, plant and machinery is less than Rs 3 crores. Secondly, the union budget proposals seek to increase excise duty on pressure cookers from 10.5 per cent to 15 per cent. According to the chairman, H D Vasudeva, there should be no excise duty on pressure cooker because of its significant contribution to fuel conservation, which in turn results in substantial foreign exchange savings and reduced deforestation. He also observes that pressure cooker continues to be deprived of tax benefits which are allowed to hundreds of other industries.

MAHARASHTRA

Gendarme of the Bourgeoisie

Amrita Abraham

IN the elections to Bombay's Municipal Corporation last November the Shiv Sena won 21 seats. Ten years ago it had twice that number, just a little short of one third of the total membership of the house. The history of the Sena in the intervening period says a great deal about the nature of communal politics generally as well as suggesting what paths the Sena will pursue from now on.

The Shiv Sena arose in response to specific socio-economic conditions in Bombay. When it came on the scene in 1965, the Marathi-speaking population of the city was less than half of its total population. Employment opportunities in the organised sector (at relatively higher wages) were not keeping pace with the increase in the labour force (natural and migrant). More and more people were left to be absorbed by the unorganised, low wage sector.

Competition for manual jobs was not perceived in ethnic terms. This was partly because of what sociologists have described as ethnic specialisation in unskilled labour — for example a high proportion of migrants from South India went into construction work whereas Marathi-speaking labour went into manufacturing industries. It was in the expanding educated lower middle class where competition for white collar jobs took an ethnic form. At the time the public sector and the government were creating more jobs than the private sector. Within the organised sector as a whole, though industrial jobs showed the largest growth in absolute numbers, jobs for the educated in the lower scales were growing at an accelerated rate.

Thus, not only did the Marathi-speaking lower middle class in the city identify its economic competition as 'outsiders', but there was scope for some immediate concessions when its demands were articulated by the Shiv Sena. This pre-empted the possibility of any other kind of political organisation to voice those demands.

The platform of 'jobs for the sons of the soil' gave the Sena a clearly defined, homogeneous base but also a very narrow one. The demand was partially met by the state government's directive giving preference in Class IV jobs in official agencies to 'locals', defined as those with a 15-year residence in the city; the private sector was also pressurised to follow suit. While this had the effect of cutting away the ground from under the Sena's feet, it also made the party and its communal basis of organisation respectable.

The 42 seats that it won in mixed constituencies the first time that it contested municipal elections suggested that the Sena had won the support of Marathi-speaking classes other than the lower middle. It tended to be seen as a Maratha party but did in fact secure the sympathies of higher castes as well, as the large Brahmin element in its leadership showed. This larger identification was along cultural chauvinistic lines. It was perceived as Hindu and Maharashtrian (many of its leaders had once been in the RSS) excluding significantly the Dalits. The Sena played all these cards, taking up the border issue, backing the singing of Vande Mataram at public functions, agitating against Tendulkar's play "Ghasiram Kotval" because it 'distorted' Maratha history, etc. But these 'cultural' accretions did not symbolise a common set of social and economic problems among the people who supported the Shiv Sena in the cities, let alone those outside.

Left to itself, this nebulous support may well have disappeared soon enough. It certainly did not help the Sena in any of the state or national elections. However this stage in the Sena's affairs coincided with the Congress split of 1969. As the single largest opposition party in the corporation the Sena had been able to get its men to head the crucial standing committee and the BEST committee. The leadership's appetite for power grew with the feeding and the Congress for its own reasons was now willing to feed it.

The Sena had also acquired a reputation for 'solving' local problems on its own; for instance, it encouraged and protected illegal roadside stalls set up by Maharashtrians. The bandhs it organised in the city and its other strong-arm tactics persuaded party workers and others that it had substantial power in the city and, what is more, would exercise it. The ideological vacuum in the party, its lack of any social or political doctrine, invited others to make use of it.

The Sena went into organising industrial labour under the Bharatiya Kamgar Sena. Why it should have chosen this field is difficult to understand in terms of the party's internal logic. Besides, Sena men have said that they had no particular labour policy other than that "labour should also be responsible and not go on strike for every small reason". They have also said that success in the labour field did not help the organisation as a whole to get votes. Nevertheless by the early 1970s they had unions in some 420 large and small units and were the recognised union in several of them. A paper sympathetic to the leftist unions has charged that the BKS was nothing more than a "major sword arm of the Sena to raise finances from factory managements". A Sena man who was in the inner councils at the time confirms this : "Everyday the capitalists came with folded hands to ask our leader what they could do for us."

Most reports are agreed that the BKS's objective was to break the communist unions. The Sena is avowedly anti-communist. An idea of its tactics can be gained from the confession of a Sena man now in the breakaway Prati Shiv Sena : "At one CPI meeting we went with hand grenades." And how far they were successful can be gauged from the fact that the city named one of its roads after the Sena chief's father at a function presided over by the chief minister.

As the gendarme of the bourgeoisie, in its role of making Bombay safe for capital, the Sena had the support of large sections of the ruling party. No real attempt was made to curb its power on the streets during those years. Even in Emergency the Sena was omitted from the list of parties that the Central government banned. No doubt the

Centre felt that certain forms of regressive, communal organisations are far less threatening than others.

By the early 1970s it was clear that the Sena had two sources of power: one, the support of a section of the lower middle class Marathi-speaking population of the city in whose name it ruled the streets; the second, and far more vital to the party, was the power it exercised as an arm of the ruling party and establishment. Which of the two it relied on more became clear gradually and at first in the municipal corporation. Civic politics had dictated agreements of various kinds between the Sena and other opposition parties like the Socialist party, Jan Sangh etc. But time and time again these arrangements were overturned by diktat from Sena headquarters, usually in favour of Congress. Similar incidents took place during the Assembly elections. Large scale dissatisfaction within and outside the Sena dates from this period. As it was committing itself more and more to acting as the Congress' stormtroopers it lost touch with more and more of its supporters. Its insensitivity to its base was clear when it opposed the first state government employees strike.

The Sena's second rank leaders, many of whom were in the Corporation, were conscious of this trend; but they say that they were unable to do much to make the Sena more responsive to those who had elected them because of the way the party is organised. There are no fulltime workers or formal membership or party forums at various levels. There is only a loose collection of shakhas based on municipal wards—100 were active, they claim, during its heyday. Satrap-like, each shaka collects funds and raises bodies of demonstrators when the Sena bhavan calls for them. Also satrap-like, many shakas run protection rackets and there have been instances of insurrection from ward bosses who made big collections of funds. All decisions are ultimately made or unmade by the Sena chief who was reported once to have said, "The soldiers have just to carry out orders. They cannot have opinions." This applies to the municipal party, to shakha bosses and other ghata leaders. Most of these leaders concede that workers are tied to the party only out of personal loyalty to the chief.

In thirteen years the Shiv Sena's activities add up to a series of incoherent incident, as well as a continuing ability to march thousands of young men under its flag. For years the Congress management of the Sena saw to it that these battalions were either committed to its side or to innocuous matters such as getting shop signs written in Marathi. During Emergency the Congress prevented anyone else from getting the benefit of those battalions. The threat of a ban was enough to make the Sena first quiescent and then come out in support of Emergency. Some Sena men say they did this for survival reasons. Others say they approved of Emergency though not all its doings. At the 1977 elections the Sena chief was describing the Janata as "the party of communists, socialists, Marxists and Jan Sanghi", and launched his party behind, the Congress again. The Janata wave and the second Congress split had the Sena trying to make an alliance with the Janata during the Assembly and corporation polls.

The Sena now officially backs the Congress(I). A Sena man says that all the major parties need their support but are reluctant to acknowledge it openly. Even the president of the state Congress(I), he said, repudiated bandhs after having used the Sena for a 'successful' demonstration in the city last year over Indira Gandhi's arrest.

Now the Sena finds that both its sources of power have been drastically reduced, its electoral support is down and its usefulness to any of the major parties doubtful. It sees no direct connection between the two events, but is wondering how to reactivate its original support. Its sthaniya lokadhikar samitis (local committees in companies) have information showing that representation of Marathi-speaking employees is 'inadequate' in several private and government bodies. There is also scope for 'social work' — educational mainly — which should win them some support. Beyond these Maharashtrian areas are price-rise agitations which they have been taking up on an *ad hoc* basis — restaurant prices in Pune, mutton prices in Bombay.

These programmes have not been taken up enthusiastically so far because the leaders feel such public support as they will bring cannot be converted into votes. They conclude that the only answer is an alliance with one of the major parties "whichever has public support at the time." Meanwhile to encourage one of them to take up its offer, the Shiv Sena will, as in the past, have to make periodic demonstrations that its battalions are intact.

THE ECONOMY

Structural Links

THE technical basis of Plan formulation in this country has been acknowledged as having been highly sophisticated and competent. Of course, inadequate and delayed availability of data and insufficient information on many structural co-efficients are serious constraints. Even in these respects, there has been considerable improvement in the data base of the Indian economy and, with that, in the econometric base of Plan formulation.

An important aspect of Plan formulation is the inter-industry transactions table or the input-output table. The input-output co-efficients help planners to estimate the intermediate demand for different commodities and commodity groups in the terminal year of the Plan period. While preparing the Fifth Plan (1973-74 to 1978-79), the Planning Commission had used an inter-industry matrix based on data for 1965-66 and updated in two stages, first to 1970-71 and then to the plan base year 1973-74.

We now have a full-fledged inter-industry transactions table prepared by the Central Statistical Organisation (CSO) in collaboration with the Perspective Planning Division of the Planning Commission for the year 1968-69. It is the most comprehensive of all input-output tables prepared so far. The matrix for 1965-66 used as the basis for the Fifth Plan was a 66 x 66 sectors model. The one now released by the CSO has been constructed for 230 sectors, though "to enable a summary overall trend of the transactions, the matrix has been aggregated into a 60 x 60 sectors table" and presented in the CSO's "National Accounts Statistics, 1970-71 to 1975-76" (pp xv to xvii, p 123, and pp 164-166). This publication presents the list of the 230 sectors and their reclassification into 60 sectors. There is also a promise of "a

separate report giving the details of the methodology adopted along with complete table and the supplementary information" (p xv). However, the White Paper itself contains a brief report on sources of data used as well as a succint account of the results thrown up by the 1968-69 table. There is also a useful attempt to provide a lead to users of data so as to facilitate a further classification of 230 sectors into three broad groups of primary production, manufacturing and tertiary activities.

Based on these details, the Reserve Bank of India's *Bulletin* for November 1978, published recently, presents an analytical study of the inter-industry transactions table for 1968-69. It attempts an aggregation of the CSO's 60 x 60 table into only two sectors, namely, commodities and services, and presents proportionate distributions of gross output and inputs amongst them. Yet another set presents inter-industry transactions matrix for six sectors, namely, primary; secondary; transport, communications and trade; finance and real estate; other services; and government administration and defence. Finally, the study makes an independent attempt at classifying, according to use-base (i e, intermediate, capital goods and consumer goods), the total availability of commodities and its major components.

Some of the summary results presented in the RBI study are noteworthy. First, about 97 per cent of the aggregate demand (intermediate demand plus final demand consisting of private and government consumptions, gross fixed investment, change in stocks, and exports) was met by domestic output, the remaining 3 per cent being satisfied by imports. Of course, the proportion of imports in total supply varied widely, ranging from more than 50 per cent in the case of petroleum and natural gas, organic heavy chemicals, and other machinery to negligible proportions in a number of other commodities.

Secondly, intermediate demand (i e, commodities as direct inputs in the production of final goods) accounted for 37 per cent of the gross domestic output. The balance comprised private consumption expenditure 48 per cent, public consumption 6 per cent, gross investment 10 per cent, and net foreign trade, negligible.

Thirdly, while the primary sector had 75.6 per cent of its gross output as value added, the secondary sector had 34.3 per cent. Fourthly, while the primary sector uses its own output as input to the extent of nearly 75 per cent of total input, the proportion for the secondary sector is about 50 per cent. A final result arising from the input-output table relates to the distribution of the incidence of indirect taxes between (a) commodities and services of intermediate use and (b) those of final use, that is, 54.4 per cent and 45.6 per cent, respectively.

This brings us to the RBI's independent attempt to classify the total availability of commodities and its components into (a) intermediate, (b) capital goods, and (c) consumer goods and to construct their indices for five years from 1971-72 to 1975-76 (with base 1970-71 = 100). Here, the total availability of goods is equal to domestic output plus imports minus exports. According to these data, the overall supply of commodities in the Indian economy was higher by 16 per cent in 1975-76 over 1970-71. The availability of intermediate and capital goods increased somewhat more, by 20 per cent and 19 per cent, respectively, while that of consumer goods registered a smaller increase of 13 per cent in the five-year period.

Secondly, the structure of final demand, as evident from the distribution of CSO's estimates of gross domestic product at market prices, shows a gradual change. Private final consumption expenditure has steadily declined from 73.1 per cent in 1970-71 to 69.7 per cent in 1975-76, while gross fixed investment increased from 15.5 per cent to 17.1 per cent. Exports increased from 4.0 per cent to 6.5 per cent and imports from 4.6 per cent to 6.7 per cent. 'Change in stocks' also increased from 2.7 per cent in 1970-71 to 5.2 per cent in 1974-75 and to 4.9 per cent in 1975-76.

Thirdly, in 1975-76 India's export consisted of 56 per cent intermediate goods, 37 per cent consumer goods and only 7 per cent of capital goods. Similarly, on the imports side, intermediate goods accounted for 54 per cent, consumer goods 29 per cent and capital goods only 17 per cent.

Thus, the results contained in the two sections of the RBI study, the first based on the input-output table for 1968-69 and the second on an independent use-based classification of CSO data on output, etc, reveal interesting relationships. But the results of the two sections are independent of each other; the nature of structural changes shown in section 2 of the study could be worked out every year based on CSO's basic data on national accounts, whereas the merit of the input-output table lies in bringing out the technical co-efficients in commodity production.

Secondly, it is incorrect to underestimate the importance of input-output analysis as the RBI study has done, by emphasising that it "is useful only under the assumption of constancy of technical co-efficients" (p 898). While this is technically correct, there is enormous scope for altering the major input co-efficients on the basis of independent information as the Planning Commission did while preparing the model for the Fifth Plan. For instance, it altered the ratio of inputs of fertilisers, electricity and other chemicals (pesticide) to foodgrains and other agricultural sectors. Likewise, input of coal to electricity had been raised and that of coal to the railways reduced following the programmes for dieselisation and electrification.

JANATA PARTY

Separate, but Unequal

M H J

THE two 'secret' conclaves of a so-called group of 24 representing all the constituents of the Janata party, and the meeting of the party's national executive followed by one of the Central Parliamentary Board held last week have brought into bold relief the fact that far from functioning as a single political entity, the Janata party is not even behaving like a good coalition. The uneasy, irritable living of the constituents — Young Turk Congress, Congress-O, Congress for Democracy, Jan Sangh, and Socialists — continues because of the political power the constituent units possess and are afraid to lose at the Centre and in some states.

Although Charan Singh has been back in government, he has not so far been able to change the situation in the Janata party to his advantage and reward supporters like Madhu Limaye (who, incidentally, has become of late one of the chief spokesmen for the Soviet Union in the country). The former Jan Sangh, with a strength of 96 in the Lok Sabha, is turning out to be the biggest stumbling block in the way of Charan Singh and his followers. How to humble the Jan Sangh into subordination has been the problem of Charan Singh, Limaye and company. They cannot stomach the consolidation of the Jan Sangh with the help of RSS in the Janata party at the ground level which it is in the process of achieving by capturing the party through the organisational elections in the recent months. Morarji Desai's refusal to take back Raj Narain into the Cabinet has made it possible to utilise the former health minister's services to open an anti-RSS, anti-Jan Sangh campaign by raising the issue of dual membership, since the Jan Sangh members in the Janata have always had their first loyalty to the RSS. The aim of Charan Singh and his followers is to stall the organisational elections and instead get the maximum number of members of BLD and Socialists appointed (or nominated) to the party posts.

Charan Singh and his followers have their reasons for wanting to stall the party elections. They know that compared to the Jan Sangh with its RSS cadre, they do not have much following in the states, except in certain pockets in the North; hence, their parties would be left with little representation in the Janata party at the Centre and in the state. Thus, Limaye's whole campaign has been that the Jan Sangh, with the help of the RSS, will have the largest representation in the party at all levels and will be able to capture the party. Limaye's demand is that the party posts should be filled by 'consensus'. The other constituents in the Janata led by Morarji Desai, Jagjivan Ram and Chandra Shekhar do not carry much political weight except in some states; they are only leaders at the Centre.

In last week's two conclaves of the group of 24, the Jan Sangh leaders in the government, notably Atal Behari Vajpayee and L K Advani, put up a big fight against the anti-RSS campaign of Limaye and Raj Narain and on the issue of dual membership. Almost spoiling for a fight, Vajpayee told Limaye and his supporters that the Jan Sangh would rather leave the Janata party "here and now" than sever its connection with the RSS. "Jan Sangh members have their relationship with the Janata party only for two years whereas they have been with the RSS since their childhood." Vajpayee asked Limaye to search his conscience when he demanded the government at the Centre by a consensus whereas he was not prepared to accept the Jan Sangh members in the UP cabinet. As soon as Charan Singh joined at the Cabinet, the trouble was created in UP, cluminating in ridding of the Jan Sangh representation from the UP cabinet. At the second meeting of the group of 24, the Party President, Chandra Shekhar managed to secure an approval for constituting a 'small committee' to decide the RSS link of Jan Sangh and the organisational elections. But in the National Executive meeting the following day, the Jan Sangh saw to it that the move to appoint the 'small committee' was overruled by the highest policy making body of the party and further saw to it that the party's Central Parliamentary Board was entrusted with the responsibility of resolving the question of the organisational elections as well as the RSS-Jan Sangh connection. And when the Central Parliamentary Board met the next day, it decided to ask the chief ministers of Bihar, Orissa and Himchal Pradesh to seek a fresh vote of confidence and to set up a sub-committee to resolve the differences between the UP Minister and the Jan Sangh dissidents. The Board's sub-committee on the UP affairs comprises Charan Singh, Vajpayee, Jagjivan Ram and Chandra Shekhar. Given its composition, it is unlikely the sub-committee will be able to ignore Jan Sangh's claim for representation in the UP government.

The Board's decision is a setback to Limaye and Raj Narain for, they were mainly instrumental in excluding the Jan Sangh from the UP government headed by Banarsi Das. The Jan Sangh has now emerged as the strongest force in the Janata party. With the impending disintegration of the Congress (I) following groupism in many state units of that party, and with the continuing fragmentation of the Congress, the Jan Sangh will always remain a big force in any future re-alignment at the Centre and in the states. In clearly stating that the Jan Sangh will prefer to quit the Janata party if it is insisted that the party disown the RSS connection, the Jan Sangh leadership has made it abundantly clear that its separate existence will stay, come what may.

KERALA

The Ghost of Rajan

Mukundan C Menon

THE lengthy judicial procedure in the famous Rajan case in Kerala began with the habeas corpus petition filed by Eichara Variyar, father of Rajan, in the Kerala High Court requesting it to pass an order for the production of his son who had been arrested by the police during Emergency. In that petition filed on March 25, 1977, Karunakaran, the then chief minister, was not included as a respondent. But Karunakaran's Assembly statement of March 29, 1977 after the High Court accepted the petition ("Rajan was not arrested by the police; nor is he in police custody. How the police is responsible to answer the whereabouts of such a person") prompted Variyar to request on March 30, 1977 that Karunakaran should also be included as a respondent.

All the respondents, including Karunakaran, claimed in their first counter-affidavit that Rajan was not at all touched by the police. Variyar's petition had stated: "I met Mr Karunakaran, who was the then home minister, at his official residence, Manmohan Palace, Trivandrum, on March 10, 1976 Mr Karunakaran told me that my son was taken from the college by the police in connection with a case of serious nature. He also assured me that he will check the details and will help all that he can in this matter." But Karunakaran in his counter-affidavit denied this account; "I never told the petitioner that his son had been in police custody. I do not know even now whether the son of the petitioner had ever been in police custody."

The habeas corpus case judgment of the High Court on April 13, 1977 stated that "it has been established beyond doubt that Rajan was taken into custody by the police". The Court also ordered all the respondents, including Karunakaran, to produce Rajan before the Court on April 21, 1977. "If they cannot do so they should inform the Registrar of the High Court the reason thereto before April 19, 1977", the judgment stipulated. Karunakaran and other respondents then submitted statements before the Registrar of Kerala High Court on April 19, 1977, reiterating their earlier claim that they had no knowledge of the whereabouts of Rajan. They also sought permission to appeal to the Supreme Court against the High Court's order asking them to produce Rajan, which was rejected by the High Court on April 23, 1977. Against this rejection of the High Court they approached the Supreme Court. But the Supreme Court upheld the High Court's stand on April 25, 1977.

This forced Karunakaran to submit before the Kerala High Court his second counter-affidavit on May 22, 1977, in which it was virtually agreed that Rajan was murdered while in police custody at the Kakkayam camp. "From the report submitted by the concerned officer on May 17, 1977, I knew that Rajan was unlawfully detained by the police, and after undergoing torture, it is to be believed that he died on March 2, 1976...I stated on the floor of the Assembly that Rajan is not in police custody on the basis of the report submitted by the Police IG on January 7, 1977."

Following this second counter-affidavit, Variyar appealed to the High Court to take action against Karunakaran, the home secretary, inspector-general of Police and senior police officers like Jayaram Padickal and Lakshmana, for giving false evidences before the High Court. The High Court's order of June 13, 1977 on this petition noted: "Mr Karunakaran was aware on March 10, 1976 that Rajan was arrested...His statement before this Court, that he knew nothing about Rajan, is false" Accordingly on July 4, 1977, the Registrar of Kerala High Court filed cases before the Ernakulam Chief Judicial Magistrate against Karunakaran, Lakshmana and Jayaram Padickal under section 34 of the Criminal Procedure Code. The IG of Police and the Home Secretary were excluded by the High Court judgment.

The judgment on this false-affidavit case was pronounced on March 12, 1979 by the Ernakulam Chief Judicial Magistrate who has found Karunakaran not guilty of the offences while the case against both Lakshmana and Padickal is still continuing.

The 42-page judgment points out that the prosecution had failed to prove beyond reasonable doubt the case against Karunakaran. The Court had looked into the following important points to reach its conclusion: whether the affidavit of Karunakaran in the High Court denying Rajan's arrest was a false one; whether Karunakaran was aware that the affidavit was false; and whether he had intentionally made the statement in the Assembly during the habeas corpus case proceedings in the High Court.

Regarding the meeting of Variyar with Karunakaran on March 10, 1976 at Trivandrum the judgment states: "Both of them have narrated matters from their memory. There is no recorded evidence of the conversation. Both the sides contradicted each other about this incident. According to Prof Variyar, Mr Karunakaran assured him all the help that he can render to save Prof Variyar's son who was involved in a case of serious nature. In this matter, however, the clarification from the respondent, Mr Karunakaran, is more truthworthy....The affidavit of Prof Variyar omitted his Trivandrum meeting with Karunakaran. The respondent's side argued that the reply of Karunakaran during the meeting was not in favour of Prof Variyar. After rethinking, Prof Variyar gave a politically motivated statement instead of facts."

The judgment notes that immediately after knowing the details of Rajan's being held in police custody at Kakkayam camp from one of his relatives, Variyar hurriedly left for Trivandrum on March 9, reaching there the following morning. The judgment finds this as sufficient ground for doubting claim of Variyar that he was unaware of the whereabouts of his son. The judgment also notes. "It is surprising that even after the assurance from Mr Karunakaran, the home minister, that he will help all that he can, Prof Variyar did not further enquire with him the matter of his son" Instead, for the same purpose, Variyar met the then chief minister, C Achutha Menon, more than once as well as the then KPCC President, A K Antony, who was to later become chief minister. "If Mr Achutha Menon was brought in as a witness it would have helped in throwing more light in this case", the judgment notes. "In the list of witnesses Mr Menon's name was mentioned. But the reason of the prosecution to avoid his appearance is unknown. Mr A K Antony, who told Prof Variyar

[illegible] Rajan, was living under police custody, was also not turned as a witness. When this case was going on Mr Antony was the chief minister and therefore the prosecution enjoyed ample opportunity to take evidence from him."

About the reply of Karunakaran to a letter of Viswanatha Menon, then an MP, relating to the arrest of Rajan, which formed an important part of the case for prosecution, the judgment has this to say: "By depending upon this reply one cannot make a jump to reach the conclusion that Mr Karunakaran was fully aware of Rajan's arrest. Karunakaran's reply was uncertain and without certainty. The then home secretary gave evidence that the reply was only a routine and ordinary one..." The evidences of the two witnesses about the election speech of Karunakaran at Mala constituency is also rejected by the Ernakulam Court. According to these two witnesses, both belonging to CPI(M), Karunakaran had said in his election speech that Rajan was arrested following a murder connected with a banned party. "The then Central minister, Mr A C George, Kerala MLA, Mr E Gopalakrishnan, and several other CPI and RSP leaders were also present on the same platform when Karunakaran made the speech. They should have been brought in as witnesses... None of them were found in the witness list".

It is likely that this judgment will create some problems for the CPI-led ministry in Kerala. Karunakaran quit the chief ministership following the judgment of the High Court and the starting of judicial proceedings against him for filing a false affidavit. The state Congress-I leaders are now demanding for a return to the earlier state of affairs, meaning that Karunakaran should once again be the chief minister. This has placed the CPI-led coalition in an embarrassing position, for it is the same coalition which asked Karunakaran to step down following the High Court's verdict and which ultimately led to A K Antony's elevation to the chief ministership before the Congress split. Following Antony's resignation and the Congress split, the CPI candidate headed the ministry from which the Congress-I was excluded. Presently, while a section of the Kerala CPI is ready to have Karunakaran as chief minister as part of its line of fighting the RSS menace, the Congressmen led by Swaran Singh are suggesting dissolution of the Assembly and fresh elections.

But the disappearance of Rajan still remains a 'mystery'. The Coimbatore court awarded only mild punishment to a few police officers for illegally detaining and torturing Rajan. But the court made it clear that the prosecution had failed to prove beyond reasonable doubt that Rajan was murdered.

BIHAR

Gangsters and Politicians in Dhanbad

Hiranmay Dhar

THE present series of killings in the Dhanbad area, in which at least 57 persons have died, can be said to have begun on March 29, 1977, when B P Sinha, the INTUC boss and the godfather of Dhanbad's underworld, was killed. Some months later, D R Singh, a clerk in TISCO's Jamadoba colliery, was killed while he was working in the office. He was one of B P Sinha's men. This murder was followed by the murder of his two brothers, because they had lodged the FIR of their brother's murder with the police. On December 26, 1977 Mukhram Singh, a supporter of Surajdeo Singh, the Janata MLA and leader of the Janata Majdoor Sangh whose recent arrest on charges of conspiracy and murder has highlighted the problem of gangsterism in Dhanbad, was killed. In that incident R K Mahato, a friend of Mukhram Singh also died. Others murdered during this period include Sakti Mahato, an important leader of Colliery Kamgar Majdoor Samti and Kedar Pandey, a CPI(M) leader.

On January 9, Surajdeo Singh's men made an attempt on the life of R S Ray, the local CPI leader and his one-time poll rival, near Alkusa colliery. Ray escaped but three of his men died. This time, however, the district authorities acted fast. Surajdeo Singh was arrested the following day on charges of conspiracy and murder and two days later he was served with an externment order. He was also indicted on 60 criminal charges, which included 17 murders. Externment orders were also served on Satyadeo Singh, Rajdeo Rai, Rajkumar Rai and 14 others. This crackdown had an immediate impact. In contrast to the 24 political murders in Dhanbad in the three months of last year, there have been no such killings in the last 40 days.

Surajdeo Singh's first reaction to his arrest was to try to whip up 'popular' support. On January 12, the Sanjukhta Chatra Sangharsha Samiti, now under his patronage, demonstrated before the collectorate, demanding Surajdeo Singh's immediate release, waiving of the externment order on him and the institution of a CBI enquiry into these political murders. There was also the threat of a strike from transport operators. But these threats petered out quickly. What now remains of this attempt at 'mass' mobilisation is small gathering of his henchmen goaded into fasting by the Janata Majdoor Sangh, Surajdeo Singh's union, in front of Dhanbad collectorate. The fasting men are alleged to be paid Rs 15 daily for their pains.

But a more sustained pressure for the release of Surajdeo Singh has come from his political lobby in Patna. The state's labour minister airdashed to Dhanbad, met Surajdeo Singh in jail and assured all help to him. The labour minister was acting at the behest of a powerful group in Patna which includes the state's irrigation minister and the supply minister and a number of MLAs. Pleas on behalf of others like Satyadeo Singh have come from the state's agricultural minister. The rallying point is caste — Surajdeo Singh and other of his ilk are mostly Rajputs while B P Sinha was a Bhumihar. Few institutions in Bihar are above such prejudices and partisan feelings and even the chief minister who initially promised 'stern action' against the criminals has shown signs of indecision. An executive fiat has already reached Dhanbad district authorities prohibiting externment of MLAs and other important personalities from the district. The present — and continuing — crisis within the state Janata party has given an edge to Rajput pressures.

The link-up between gangsters and politicians began with the co-option of B P Sinha, a migrant school teacher from Monghyr, first, by the Socialist Party and then, by the Congress to look after their trade unions. It was B P Sinha who spotted Surajdeo Singh,

then a darwan and small time money-lender in [illegible] coal mines. Together they fashioned out their politics and method. Their objective was primarily to keep the communists away from the Dhanbad coal belt. Surajdeo Singh's rise, in fact, began with his successful fight against the Communist leader A K Roy in Madhuban colliery. An appreciative management presented him with a contract for civil construction in their colliery.

The formation of the Bharat Coking Coal (BCCL) after nationalisation enabled Surajdeo Singh to legitimise his operations. Just before the formation of the BCCL, Surajdeo Singh had all his men posted in key positions as payment clerk, surface-in-charge, camp-lamp-in-charge, overseer, etc. All these people, approximately 500 in number, were absorbed by the BCCL, thus enabling Surajdeo Singh to influence management decisions and grab the lucrative contracts for coal transport and sand stowing. Naturally, he has also amassed wealth. He owns two posh cinemas in Dhanbad and a palatial house — Sinha Mansion — in Seriadhela, on the outskirts of Dhanbad. He does extensive illegal mining business and also finances dealers of poor quality coal on payment of commission. He forces exactions. His earnings are estimated to exceed Rs 1 crore annually.

Surajdeo Singh joined the Janata party after Emergency and won a seat to the state assembly in the June 1977 elections as a Janata candidate. His connection with Chandrasekhar, the Janata Party president — they come from the same region — soon earned him more friends in the Bihar Janata party. He also established his own trade union, the Janata Majdoor Sangh, and secured control over the Janata Sanyukta Chatra Sangharsha Samiti, the local student front of the Janta party. Last year he attempted to buy *Dainik Awaj*, the local Hindi daily, but was foiled by the staff of that paper. He has now constituted a 'Janata Press Fund' to collect money for starting his own press.

The life stories of other gangsters follow broadly the same pattern. Satyadeo Singh, for example, is an ex-colliery owner, who has taken to contract jobs. He too was introduced to politics by B P Sinha. Because of his upper class upbringing., his functioning is more sophisticated than that of Surajdeo Singh. Navarangdeo Singh is another ex-mine owner, who has turned to a gun-totting contractor. With Satyadeo Singh, he now forms the main opposition to Surajdeo Singh. Among other important personalities of this kind are Rajkumar Rai and Rajdeo Rai.

In Dhanbad the gangsters, political operators and the BCCL are closely inter-linked. Often the gangsters themselves masquarade as political personages. The process can best be seen in Kustaur Colliery. The labour union in that colliery is controlled by Janata Majdoor Sangh, Surajdeo Singh's outfit, which wrested it from INTUC last year. The job of civil construction in the colliery has been given to Seopujan Singh and Shrikant Singh who are both union operatives and Surajdeo Singh's lieutenants. R N Singh and Bros, a front organisation of Surajdeo Singh, has taken the contract for coal transport and sand-stowing.

A variant of this practice can be found in the ENA colliery where too the JMS controls the union. The job of transporting coal and sand has been assigned to concerns not directly owned or controlled by Surajdeo Singh. Surajdeo Singh however receives a commission for permitting them to operate in this colliery. Similar arrangements exist in all the collieries whose union are controlled by Surajdeo Singh's Janata Majdoor Sangh.

Dhanbad's socio-political system has some apparent contrasts. Its coal workers are well paid; the BCCL's daily wage varies between 9 rupees and 15 rupees. The workers' exposure to the political process has been long and varied. Yet their general living conditions are most wretched. This is because of a careful perpetuation of primitive cultural practices — among other things — which drives the workers to drink and indebtedness The loans have to come from unofficial moneylenders. To ensure security of this usurious investment, force, or at least the threat of it, is imperative. This is provided by the gangsters who are often themselves moneylenders.

What is however new in this otherwise age-old practice is its total integration with the State and the national political system. Surajdeo Singh is no longer just an instrument of exploitation; he now officially represents the ruling Janata party in the state assembly.

The formation of BCCL has strengthened this legitimisation process. When this correspondent asked the chief managing director of the BCCL about the alleged collusion between the goondas, the contractors and some of the BCCL officials, the response was: "We give out contracts to the legally constituted firms. We cannot find out who they are. The BCCL officials do not have any connections with the goondas. But then they have to work under this situation. So they have come to a 'working relationship' with them." It is this formalistic attitude of BCCL management that has helped these gangsters to continuously consolidate their positions in Dhanbad. The BCCL pays, even according to official admission, about Rs 10 crores every year to the transport contractors. (It is, according to our estimates, about Rs 24 crores annually.) This money is methodically apportioned between the principal gangster groups. It is only recently that the BCCL has taken up a plan to develop its own transport system; but, even from the most optimistic point of view, such a system can take over only about 20 per cent of the its present transport needs — and that too not before ten years. And for a complete take-over of the transport system, the BCCL needs another 20 years. Thus, for the rest of this century, the contractors are assured of steady funds. Actually, it is doubtful if the present management can get rid of this contract system. A former chief managing director of the BCCL attempted to do it and he was transferred unceremoniously.

The Janata party needs funds, and the colliery gangsters have always provided funds to ruling party. The party and its trade union wing also has to fight the colliery Kamgar Majdoor Samity which, if allowed to continue its present good work, may possibly mean an end to the loot of Dhanbad miners. This cannot be allowed. Hence this frantic anxiety of Janata leaders to secure the release of Surajdeo Singh and others, and the reported moves to bring about an accord between various gangster groups. With the Janata leaders exerting themselves on behalf of the gangsters, it is unlikely that the pitiful efforts of the district authorities to contain these anti-social elements will succeed.

UGANDA

End of Amin?

THERE is hardly a dictatorship in Africa as notorious as Amin's. Many a political observer has wondered how such an oppressive regime has survived year after year. 1979 brought Amin into the ninth year of his rule, matching the length of Obote's regime. From all signs, however, 1979 also promises to mark the end of Amin's dictatorship.

Two factors explain why the regime has survived as long as it has: the weakness of the internal opposition and the strength of external support for Amin. It is also the shift in the weight of these very forces that explain Amin's declining fortunes today.

Amin's Foreign Collaborators

It would appear from public pronouncements that the Amin regime was one of the most isolated in the continent, with friends only among the reactionary Arab states. But such has never been the case. What accounts for this impression is the sharp inter-imperialist rivalry in Africa. As a result, Amin's major-power alliances have been continually shifting. His only steady alliances have thus been with Arab and African regimes.

After the expulsion of the Israelis and the Ugandan Asians in 1971-72, relations between Amin and UK-Israel soured. But the US stepped in to nullify British economic measures against the regime. By 1977 the US had become the regime's principal trading partner: from purchasing a fifth (20 per cent) of Uganda's coffee crop in 1973, the US took a third (33.5 per cent) in 1976. (Coffee accounted for 93 per cent of Uganda's total exports in 1976-77.)

In 1978, the US placed a ban on trade with Uganda. But most Ugandan coffee reached the US indirectly, being flown by US charters to Djibouti where French businessmen bought and shipped it to New York, and was thus unaffected by the ban. Also, US relations with Uganda were increasingly moving from the overt (trade) to the covert (military and intelligence support).

According to information presented at the US Congressional Hearings (1978) on Uganda, US corporations have supplied Uganda with planes, helicopters, tactical trucks, communications equipment and trained personnel for all these, including for the notorious State Research Bureau. The entire fleet of Uganda Airways, established in 1977 and comprising one Lockheed C-100-30 and two Boeing 707's, were got through ATASCO, a firm jointly owned by the Israeli Ministry of Defence, the US Export-Import Bank and an Israeli tycoon called Eisenberg. (Each transaction had to go through a number of intermediaries to be sufficiently laundered!)

Major arms support for the regime came from the Soviet Union. A Soviet military mission visited Uganda in November 1973. There followed supplies of Soviet big arms — tanks, MiGs and all. By 1975, the fascist regime is estimated to have received from the Soviet Union $ 12 million in economic 'aid' and $ 48 million in military 'aid'.

Other powers — particularly the EEC and Japan — stepped in as Amin proved his capacity to survive, particularly following the 1972-73 invasion. Britain abandoned its economic blockade and became the second largest coffee purchaser (20.5 per cent in 1976). West Germany moved into mining and prospecting; Japan into road-building and road transport, Italy into manufacturing industries and electrical installations; and Belgium into railway workshop and maintenance services.

It is in this context that we must view Libya and Saudi Arabia's connections with Amin. Both have given the regime small but crucial aid, for example at the time of the 1976 OAU summit in Kampala. Libya also has joint investments, channelled through the Libyan-Arab Development Bank and worth $ 25.5 million in 1976, in sugar, transport and cement production in Uganda.

Kagera Invasion

The backdrop to Amin's sudden change in fortunes was his invasion of the Kagera salient in northern Tanzania in October 1978. The ensuing border war between Tanzania and Uganda had a sharp impact on both the alignment of external forces to East African politics and the active Ugandan opposition to the Amin regime.

The October invasion was a result of Amin's internal problems, in fact, it was intended by him as a solution to these problems. From the day of the coup, the economic situation was on the decline as the economy was geared to building up the military machine. Consumer goods were scarce and prices high. Peasant production for the market was on the way down. Soldiers, let alone workers and civil servants, were often not paid for months. The circle of the privileged — army personnel who were supplied luxuries ferried directly from England by Uganda Airways — was progressively narrowing. The regime had lost its original social base among the up and coming bourgeoisie. Its terror machine was manned increasingly by mercenaries from southern Sudan and eastern Zaire. Local soldiers could no longer be relied upon.

With the army no longer immune to economic hardships, disaffection among the soldiers built up. By October 1978, whole battalions were mutinying. Even Amin's inner circle was cracking. Soldiers supporting Amin were battling those supporting his immediate subordinate, General Mustapha Idrisi.

For the Kagera invasion, Amin employed the disaffected battalions, Chui (leapord) from Mbarara and Simba (lion) from Masaka. The invasion also had a predatory character, designed to sooth disaffected soldiers: anything of economic value that was mobile was taken away; the rest was destroyed.

The invasion received immediate support from the most backward forces on the continent, the Smith and Vorster regimes. Smith had long tried to duplicate in southern Africa Israel's strategy in the Middle East: attack the front-line states one by one, give it the appearance of an inter-state affair, and neutralise these states one by one. Thus, the racist invasions of Mozambique, Zambia, Botswana and Angola. But neither Smith nor South Africa shared a border with Tanzania. The solution was now offered to them: Amin's invasion of Tanzania.

On his part, Amin already had relations with Smith. He had for some time been training a private army for Sithole, ferried to Uganda and back by Rhodesian Air Force planes. All that remained was to strengthen existing relations. Supplies began reaching Uganda *via* Zaire and other routes.

Anti-Amin Forces

Tanzania understood the constellation of forces behind Amin and realised that this was not simply a local conflict. It prepared to "kill the snake". As the border war built up and moved from Tanzanian to Ugandan soil, it produced a dual effect.

On the one hand, Ugandan opposition to Amin, both internal and in exile, was activated. Besides the pro-Obote guerillas who had trained for years, many new ones now began to join battle with the Amin troops. Chief among these were the guerillas of the Save Uganda Movement (SUM) and the Front for National Salvation (FRONASA). The organised opposition began to assume a national character.

On the other hand, this activation of the anti-Amin opposition neutralised Amin's main Western allies. They sought to put a foot in both camps: whoever wins, they must not lose. As Tanzania vigorously pursued its war with Amin and as the Ugandan opposition to Amin began to organise, the Western powers, mainly Britain and the US, prepared to desert the Amin camp.

The watershed was the Moshi conference of March 23-26, 1979. Out of a coming together of 21 different anti-Amin groups, the Uganda National Liberation Front (UNLF) was created. An organisation comprising forces across the ideological spectrum, its point of unity is opposition to the Amin regime. This, however, is also the source of its immediate strength. Given the diversity of interests represented within it, the Front could attract a diversity of support from outside. Amin's international support eroded further. Some, like Britain, openly supported the Front. Others, like the Soviet Union, preferred silence. Thus it is that today only Amin's hitherto secondary allies, mainly Libya, are openly by his side.

The longer the war lasts, the more it will tend to become internationalised. Should that happen, and should the military situation take a turn favourable to Amin, we can expect imperialist powers to once again shift positions accordingly. For the moment, however, it appears Amin's days are numbered.

LOME CONVENTION

EEC's Brand of Neo-Colonialism

S Siri

THE second round of the Lome renegotiations, which have just concluded in the Bahamas, has again shown what the major concerns of the developed countries are in their relations with underdeveloped countries.

The Lome convention is an agreement among 56 African, Caribbean and Pacific countries (ACP countries) with the European Economic Community. It lays down special provisions in the economic relations between these two groups of countries — mainly in four areas: trade, stabilisation of export receipts (stabex), industrial co-operation, and financial and technical co-operation.

I

The original convention was signed in February 1975 to last for a period of five years. As it is due to expire in February 1980, efforts are currently being made to renew the convention. The ministers of the 56 ACP countries and the nine EEC countries met for four days from March 22 to 24 at Freeport in the Bahamas, in what is considered as a penultimate meeting; the next ministerial conference, to take place in May, is expected to come to final agreement on the provisions of the next convention.

The ACP countries want to see improvements in the various provisions before they sign the convention; the EEC is prepared to see marginal improvements only, but wants to use the occasion to gain special advantages in areas which it is increasingly getting concerned about: (a) access to raw materials; (b) energy; and (c) share in international trade.

The Lome convention was an attempt to provide a successor, codified, arrangement to the numerous special relationships prevailing historically between the various Common Market countries and their former colonies. Before the entry of the UK into the Common Market, these special relationships were mainly confined to the African countries, in the form of the Yaounde convention; but with the entry of the UK, which also had maintained special relationships with its former colonies, the whole question came up again. The other EEC members resisted allowing preferential arrangements, particularly in trade, to countries like India, Hong Kong and Singapore, which have become increasingly able to compete with Europe. The result was the Lome convention, from which the relatively better established underdeveloped countries were excluded.

The main purposes of Lome I (i e, the first convention, signed in 1975) were clear: to maintain a sphere of influence for Europe and secure some material advantages from it. It granted free access to the exports of the ACP countries of agricultural products, but with restrictions on manufactures and on products like beef and sugar which the community was historically encouraging to produce within itself by maintaining high domestic prices. It instituted a scheme for stabilisation of export earnings with respect to some agricultural materials or products like cotton, coffee, cocoa, groundnuts, etc. The list of these products was carefully designed in such a way that any degree of processing was ruled out. The main concern, here again, was to stabilise the conditions under which the producers of these commodities can carry on production, to result in a secure base for the flow of these materials to Europe. It laid down preferential provisions in the field of industrial development, such that Community entrepreneurs have special access to investment opportunities in the ACP countries. Finally, the Community has set aside a sum of money to finance projects submitted by the ACP countries, by giving loans and grants. This fund, which is very much a case of pooling individual EEC country aid contributions, is to operate by screening each individual application and deciding whether the project is in accordance with the aims of the Community. It could rule out projects which might be in potential competition with Europe; it could give preference to projects which would enhance the supplies of products feared to be in critical shortage from the point of view of Europe — e g, energy. It also ties up procurement to within ACP-EEC, which effectively means EEC. The financial aid, formally provided for in the conventions, is an ambitious attempt to co-ordinate the efforts of the individual EEC countries in securing export markets, and in securing a pattern of industrial development that is complementary to the needs of Europe.

Such is the convention which has come up for renegotiation. One might ask: why don't the underdeveloped countries throw up the whole thing? Why should they enter into something which ties them so much to Europe?

It is not that the ACP country negotiators are unaware of some of the implications of Lome. But they are caught in a historical situation where they feel that they don't have much of an alternative. They need funds, even if only to develop the sectors

complementary to Europe. They need any short-term relief they can get, such as stabex provides. They are glad to have some preferential access to the markets of Europe, even if this is designed in such a way that it biases economic activity towards raw material export. This is, of course, looking at the thing sanely. There are many insane reasons as well: many of the negotiators do not have the political will to oppose Europe back at home — their survival might depend upon whether the Belgian ambassador or the English ambassador likes them or not.

II

But be that as it may. The ACP countries have come up with demands for some improvements within the framework of Lome. They want provisions in the next convention to guarantee free access to all their exports, they want the safeguard clause, by which the EEC can impose restrictions on the import of any item whenever it feels threatened by competition, to be suspended with respect to the ACP countries; they want removal of quantitative restrictions on some of their important exports: sugar, beef, rum, etc.

They have also demanded improvements in other areas: that the stabex should work in such a way that it stabilises real, not merely nominal, export earnings. They want stabilisation not only with respect to agricultural materials, but, significantly, with respect to minerals like copper.

In the field of industrial and financial arrangements, the ACP countries have argued for larger flows and for more automatic mechanisms so that the ACP countries have the freedom to choose the projects they like and get finance with less time-lag. They want participation in the financing decisions: to sit together with the EEC in deciding which projects are to be financed; and to know why some projects are rejected, if they are.

The Europeans are not prepared to accede to any of these major demands. They are prepared to go a little way here and there but they want to keep the character of Lome preserved as it is. They are not prepared to grant free access to all the manufactured products of the ACP; but they might consider some individual cases. They might buy a bit more beef, but complete access will not be possible.

They are not prepared for any major changes with regard to stabex or the way financial assistance works either. They do not want indexation of export earnings; they are not prepared to share the financial decisions when administering the European Development Fund, the financial resources committed for aid.

III

Instead, the EEC has shown anxiety to gain advantage in at least three areas: (a) energy; (b) access to raw materials, and (c) share in the markets of the APC countries.

Energy: The EEC wants to come to special arrangements in the development of the energy potential of the APC countries. This is a reflection of the nightmare under which the advanced industrial countries have been living for some time: they fear a world shortage of energy and they want to do everything they can to prevent it. As a general strategy, they want to develop energy resources wherever they can even if there is no explicit commitment that it will be available for them directly. But the hope is that if there are numerous sources and with plenty of the potential developed, a situation of near excess capacity would emerge, which ought to ensure that one country or the other would be eager to supply energy on the terms the industrial countries want. This is the strategy behind the World Bank's much publicised recent concern for and commitment to investing in oil exploration and development, a field which it had left out until recently. This is the concern of the Europeans — whereby they want to write in not only a special protocol on energy in the new convention, but want to state that priority would be given to financing energy projects under the financial arrangements.

Access to Raw Materials: The other concern of the Europeans, which has come through clearly, is how to ensure raw material supplies. Besides the existing provisions which go to satisfy their interests in this regard, they want to introduce at least two new provisions: (a) a protocol on fisheries, which gives them preferential access to the sea waters of the ACP countries; and (b) a scheme for minerals.

The fishing industry in Europe is suffering from depletion of fish in its sea waters; the Europeans are eager to exploit the as yet relatively little used potential of the ACP countries by gaining special access to it. The ACP countries have not yet responded to the suggestion, but it is clear that they cannot refuse to give such a preferential arrangement to the Europeans, given their willingness to continue with Lome.

With regard to minerals, the developed countries are afraid of the possibility that the Common Fund, if it succeeds in the fashion originally proposed by the underdeveloped countries, might result in price escalation. The countries which are heavy importers of raw materials like West Germany and Japan are trying their best to prevent such an outcome. The Common Fund, it is now clear, will not be allowed to be more than an association of individual commodity agreements, arrived at separately; and that it will not have enough financial resources to undertake price stabilisation, *via* stock holding.

West Germany, as part of its effort to prevent the Common Fund, has proposed that minerals be included under stabex in the Lome convention, the idea is that you compensate for loss of export earnings, as in the IMF compensatory financing facility, as a way of taking the heat off the demand for the Common Fund. From the point of view of the developed countries, it is much better to make financial transfers when prices fall, rather than risk setting up an institution which would stabilise — and possibly help to enhance — commodity prices.

The German proposal, however, is seen as giving away too much too soon, the other Community members, and the European Commission, are proposing a scheme by which they provide for funds for development of mineral resources, as in the case of energy; and provide for a limited stock-holding facility.

The Community scheme, which is yet to be put officially to the ACP countries, has three elements: (a) provision of grants or loans, on a project by project basis, to bring back into use the capacity of mines which have been disrupted due to civil wars (e g, Zaire) or accidents or such factors. The aim here is to get to the maximum production capacity possible in a short term. (b) Provision of loans directly to the firms involved to hold stocks of minerals, whenever the demand falls to the point where prices are unremunerative from the point of view of future investment. These loans are not to be for more than one year, and will be extended by commercial institutions with the guarantee of the Community and the ACP government in question as security. The idea here is to provide for a very limited financing facility, such that investment in minerals can be encouraged. For example, it is thought that for a long time, the pre-

sent low prices of copper have been preventing investment in capacity expansion; and yet, at the same time, it is feared that a shortage is likely in about 7-8 years' time, unless investment commences immediately in view of the long gestation periods. This element in the Community proposal, thus, is aimed at reassuring investors that if prices fall too low, there would be some finance forthcoming to hold stocks; but the proposal is circumscribed in such a way that it cannot be made use of for price enhancement or even stabilisation in the manner of the Common Fund. (c) Provision for training of personnel in the production of minerals and for a scheme by which the assets of the investing companies can be guaranteed. The Community wants the ACP countries to guarantee the Community investments against nationalisation or such measures, or, if the ACP countries are not forthcoming with complete assurances on this, the Community wants to devise a sort of insurance scheme by which it can reassure community investors.

Such are the proposals likely to be made on minerals. The main thrust of the proposals, again, is to expand production capacity in the areas complementary to European industry and necessary for the steady supply of raw materials to it.

Access to Markets : The third area of concern, uppermost in the minds of the Europeans, is the question of how to prevent competition from import of manufactures from the ACP countries. At the moment this is not serious, with imports of manufactures from ACP countries comprising only a tiny proportion of total supplies. But they fear future competition, and to prevent such a situation, they are clearly opposed to relaxing any rules even if they prove to be of limited significance in the present. Coupled with this is the attempt to secure an increasing share of the export markets, the Community, through its procurement clauses associated with its aid, manages to secure a large export market as it is. But the attempt here is not to lose the advantage they have and to buttress it further through close supervision of consultancy contracts, etc. Since the post-1973 74 depression in the industrialised countries, there is intensification of competition for export markets, particularly in the underdeveloped countries, among the major industrial powers: the US the EEC and Japan. The EEC wants very much to keep its present advantage in the ACP countries without granting any better access to ACP manufactures within its own markets: the case of cotton textiles and clothing, where the Community exports three times what it imports from the ACP countries, and still insists on quantitative restrictions on such imports, is illustrative.

IV

The renegotiations are likely to conclude in May, with only the signing ceremony left. These renegotiations go to illustrate once again the major issues and concerns which are shaping the relations between the former colonial powers and the former colonies. In the name of aid and trade, the former colonial powers are trying to ensure a pattern of industrial development that is complementary to, and often required by, the needs of their own industry. The underdeveloped countries, even if conscious of this effort, are caught in a situation where they seem to be unable to resist it completely. But it is obviously a situation that provides only a marginal grace period to the Europeans, for it cannot last long. A time will surely come when things will have to change.

WEST ASIA

Isolation of Egypt

THE 'drama' that began with President Sadat's visit to Jerusalem has led, almost inevitably, to the farce and mockery of the 'peace treaty' between Egypt and Israel signed under the aegis of the United States. The leaders of Egypt, Israel as well as the US are trying to demonstrate to the world at large that they have overcome tremendous difficulties and complexities in arriving at this settlement. But it would be wrong to say that 'peace', even between Egypt and Israel, has been really achieved.

President Carter's decision to personally engage in shuttle diplomacy was a desperate one. The situation was perceived to be so grave that a US president had to be on a twentyfour hour stand-by to ensure agreement.

The situation in West Asia is still uncertain, more so against the background of conflicting statements by US defence secretary Harold Brown and energy secretary James Schlesinger about military action to safeguard oil supplies. Although these statements are supposed to have been made in response to the events in Iran, what they demonstrate is that the United States has failed to learn the lesson of Iran. The movement in Iran is not only an Islamic phenomenon; it is also a nationalist movement. The new Iranian regime's support for Arab, particularly Palestinian, rights is derived from the anti-imperialist and anti-Zionist stand of the new regime.

There is increasing opposition in the Arab world to outside interference, whether political or military, in the area. Camp David is now more clearly seen as an attempt by the United States to secure its own interests at the expense of the interests of the people of the region, particularly the Palestinians, who are anyway accustomed to, but not the less bitter about, being considered dispensable. Further Sadat's eagerness to act as the local agent for US interests, to the extent of being ready to dispatch his armed forces to distant 'troublespots', has raised doubts among Arabs, including Egyptians. The Brown-Schlesinger way of thinking suggests that as far as the US is concerned there cannot be any foreseeable reduction of the profligate US demand for West Asian oil. Hence the threatening noises; but before the US can actually engage in armed intervention, it needs to ensure that some sort of an agreement between Egypt and Israel is arrived at.

To further strengthen Israel as a safe base for US interests, the Carter administration has proposed to provide $1,785 million as military assistance to Israel in its 1980 budget. The amount represents about 42 per cent of the total military assistance — some four-billion dollars — which the United States proposes to give to 62 countries around the world. It seems incredible that such a programme of massive military aid to Israel can be accompanied by a reiteration of the US commitment to 'peace' in the Arab East.

Thus, while President Carter flew into the Arab East with the olive branch, a flotilla of US warships was streaming into the Gulf. The declared aim of both events, according to Washington. peace and stability in West Asia. To Washington this may appear to be a clever carrot-and-stick approach: but, beneath this approach are

two or even three sticks: one with which to beat the Egyptians into signing the 'Peace' treaty; the other with which to prod the Saudis and other Gulf states into going along with the US view of the threat to their own vital interests; and a third to wave in the direction of Moscow, warning it against succumbing to the temptation of intervening in the area.

The people of the Arab world will, however, continue to reject any 'peace' plan that does not meet the three irreducible requirements for a just and lasting peace; complete Israeli withdrawal from occupied territories; guarantees of Palestinian rights including a state of their own; and the return of East Jerusalem. The Camp David approach, even if seen as merely a first step does not generate much trust in the region. By isolating Egypt, the most populous Arab state and also the most dominant of the confronting states, President Carter might have gained a victory in the short turn, but his policy is fraught with dangerous consequences in the long run.

WEST GERMANY

Citizens' Initiative Movement

Saral Sarkar

IN the last few years, Citizens' Initiatives (CIs) have become an important force in the political life of the Federal Republic of Germany. They can be defined as loose unions of citizens for specific purposes. The most famous example of Citizens' Initiative took place in 1971. Badenwerk — an energy-supply company — applied for the construction of an atomic power plant (APP) in Breisach in the Kaiserstuhl area (south-west Germany). The opponents of the APP were peasants, vine-growers, fishermen and environmentalists. They joined together and formed several CIs. They organised a big protest-movement with various actions — e g, a tractor-demonstration with 560 tractors, a resolution with 65,000 signatures, etc — and applied political pressure. In view of the massive resistance, it was decided in July 1973 to locate the APP not in Breisach, but in Wyhl, a village in the same Kaiserstuhl area.

But here, also, resistance developed. For instance, there was a fishermen's demonstration with a boat-procession on the Rhine, a tractor-demonstration of peasants with 400 tractors, a resolution with 90,000 signatures, and a march from various villages of the area to the construction site in Wyhl. In the whole area, 21 CIs were formed to carry on the protest movement. But, in Wyhl itself, a majority of the citizens (55 per cent) voted for the sale of municipal land needed for the APP and 43 per cent voted against. The citizens of Wyhl were silenced by various promises of benefits as well as by intimidations, including the threat to expropriate the land in case of a negative decision.

This kind of energetic intervention by the provincial government of Baden-Wurttemberg had more than one reason. First, the whole energy policy of the government (of both the federal and provincial governments) is based on the construction of APPs; secondly, construction of an APP is big business. In the case of this particular APP, the chief minister and the finance minister of the province, the speaker of the provincial parliament, and three lord mayors of the area, were all members of the board of directors of the construction company 'Badenwerk'. The referendum in Wyhl took place on January 12, 1975, the construction work began on February 17, 1975, and on February 18, 1975, some citizens of the area occupied the site, enforcing stoppage of the work. On February 20, 1975, 700 policemen cleared the place, arrested 54 persons, and fortified the place with barbed wires.

On February 21 and 23, two big demonstrations took place. After the second one, in which 28,000 people took part, 3,000 demonstrators stormed the place, drove away the policemen, and occupied the place for the second time. The place remained occupied for eight long months. Since the provincial government demanded the vacation of the place as a precondition for starting the negotiations, the CIs offered to convert the occupation of the place into a guarding as a compromise, and implemented the same on November 11, 1975. The CIs left the place, only the picket remained. In six rounds of tough negotiation, a compromise was worked out — the 'Offenburg Agreement'. In it, the provincial government promised stoppage of construction upto Ooctober 31, 1976, withdrawal of all cases against the demonstrators, a series of new expert-opinions on the APP, and further dialogues. The CIs in their turn promised not to undertake any illegal action and to remain non-violent.

From the very beginning, the Offenburg Agreement was highly controversial. In the first voting, on February 27, 1976, the delegates' conference of the CIs rejected the Agreement by a big majority. However, under strong pressure, it was put to vote again, and was accepted. At the same time, the CIs passed a declaration, in which they again expressed their determination to prevent the construction of the APP.

After the expiry of the construction-stop, the happenings in Brokdorg (another site for an APP) and the nation-wide discussion on atomic energy and the energy programme of the federal government came unexpectedly to the aid of the anti-APP movement. On March 14, 1977, the administrative court of Freiburg gave its judgment making the construction of the APP dependent on making the reactor explosion-proof. The construction-firm appealed against the judgment in a higher court.

Though there had been CIs much earlier, the politicians were deeply shocked by these incidents in Wyhl. It was perhaps the first time since the founding of the FRG, when the great majority of the population of an area not only protested against at decision of the government, but also prevented by various means the implementation of the decision. The ordinary politicians were disconcerted. For, as an SPD-politician expressed it, they had always believed that "In a parliamentary democracy it is still the politically responsible forces in the parliament and in the government that make the decisions" Social scientists also could not understand the phenomenon. A peace-and-conflict researcher, who was active in the movement for three months, wrote. "I did not understand it for long", for "it seemed to me beyond any doubt that the government as the arbiter of public welfare has finally the right to enforce its decisions against the resistance of particular interests". They discovered suddenly that the people, at least of this area of the country, do not any more accept these principles of

representative democracy as just.

Wyhl is an extreme example. One can give many other examples of the fact that a large section of the population — *sometimes of the whole country*, sometimes of a particular area — believe that the government and the parliament do not act in the interest of public welfare. Many people believe – and they are not all extreme Leftists — that the gentlemen up there act in the interest of big capital. In Wyhl, particularly, peasants and vine-growers, who are themselves small entrepreneurs, expressed this opinion. What is new in the present situation is that, over the past few years, these people no longer put up with all the decisions of the parliaments and the governments without *protest and without action*. They are organising themselves not only to protest but also to prevent implementation. The image of the a-political, obedient German is changing gradually A vine-grower of Kaiserstuhl said· For a long time now we have enjoyed an education which said, there was once a generation, and it was obedient Resist against the beginnings Don't allow that any more". This was greeted with thunderous applause.

Thus, as in Wyhl, there were protests and demonstrations against the construction of APPs also in Brokdorg, Grohnde and Kalkar In Brokdorg, APP-opponents organised themselves in the Citizens' Initiative for the Protection of Environment, Lower Elbe. In the August of 1976, the demonstrators tried twice to storm and occupy the construction site, which was secured like a fort Their motto was: "the construction site must become a meadow again". In both the attempts several hundred people were injured. In Grohnde, also, the demonstrators tried to storm the place. The demonstrations against the APP-Kalkar were "one of Europe's biggest anti-nuclear demonstrations, nearly 30,000 people marched 8 km to the gates of a heavily fortified fast breeder reactor site yesterday defying police orders... The authorities, who ordered some of the most stringent anti-riot precautions in recent history, said, thousands of policemen manning road-blocks in several states arrested 112 militants heading for the site. Police arrested 21 Germans, 5 Frenchmen, a Briton and a Turkish citizen in Rhineland-Westphalia alone...

There have been CI-actions in school reform — e g. "Action for Small Class", 'Parents' Action 72", Their watchwords were: "Change the school, now", "Parents, improve the school, now". In a demonstration for school-reform in July 1973, 10,000 parents, teachers and children marched together through the city of Hamburg.

There have also been CI-actions against the construction of city autobahns, against the demolition of old but habitable houses in the city-centre in the name of improvement of the city, against the construction of aerodromes, against projects which destroy the forest, and against dozens of other types of activities of industry and administration which, in the opinion of the affected people, destroy the environment.

But CIs also make positive demands. For instance, they demand creches, children's homes, homes for the invalid, etc, as well as the construction of a stadium.

The CIs use the following means of action: handbills, signature campaigns, rallies, resolutions, discussions — with the people, with the authorities, and with representatives o industry — information booths, placards, demonstrations with slogans, processions, in extreme cases, storming and occupation of a place, occupation of houses, and, last but not least, legal actions in courts. In case of positive demands, CIs sometimes do not wait for the authorities to do something; they take recourse to self-help, particularly for smaller matters, such as a play-field for children.

Their organisational form is loose, anti-authoritarian, and extremely democratic. They have no organisational structure with periodically elected presidents and other office-bearers. They do not have any constitution. Anybody who agrees with the particular objective can work for it through the CI. One can also cease to work any time. There is no formal membership. All decisions are taken openly in "general-body meetings". If necessary, by majority vote.

In course of time, CIs have spread so much that it is difficult to gauge their extent. Still, two figures are indicative. A representative survey of the Enmid Institute carried out in 1973 showed that 12 per cent of the citizens of the FRG were actively participating in CIs. In the same year, the home ministry of the province of Bavaria counted 380 CIs active in the province.

While these figures are one indicator of the extent of lack of confidence in representatives who occupy seats of authority, another indicator is the derogatory language that ordinary participants (but not spokesmen during negotiations) often use in spontaneous actions when they mob representatives of government or industry. An example: in a spontaneous action of the APP-opponents of Kaiserstuhl, Eberle, the economics minister of Baden-Wurttemberg, was abused with the following expressions: "'you dirt-brag, you depraved fellow, you lewd fellow", "you arsehole, you blockhead", "I tell you, if you ever push that through, I will butcher you like a sow... I will exterminate your whole clan .."

The first clear sign of this lack of confidence in representative democracy, the real cause of the CI-movement, was the students' revolt of the sixties, which soon developed into the so-called extra-parliamentary opposition. This took place against the intellectual background of a growing uneasiness over the manifold negative manifestations of the industrial society and the resulting readiness for the "great refusal" as well as the search for new contents and forms of existence. The students of the whole Western world were confronted with the moral question thrown up mainly by the American war in Viet Nam but also by the Apartheid-politics of the South African government and the suppression of opposition circles in Iran and many other countries. The students noted that their politicians were friends and allies of the oppressors of the world. Their own struggle against the authoritarian university-structure therefore acquired an inner-political as well as a world-political dimension, particularly after the formation of the "Great Coalition" (1968) between the CDU/CSU and the SPD, which was tantamount to an end to parliamentary opposition

Though the students' revolt soon came to an end and the extra-parliamentary opposition too petered out, they had left behind their trace and effect. Both movements had politically sensitised large sections of the population and made them self-conscious The recession of the years 1966-67 which for the first time since the founding of the FRG gave rise to serious doubts about the efficiency of the socio-economic syetem, the "Great Coalition", and the Emergency laws – all of this led to a feeling of impotence and despair. On the other hand, the activism of the *students created among other sections* of the population a readiness for critical reflection and concrete action. It

is obvious that the growing uneasiness over numerous implications of the control of the State by parties, unions, and the administration, played an important role in almost all CIs. Most of the CIs are actually reactions of the concerned citizens to concrete negative developments. ("It is not the CIs that have to justify their existence — it is the parties that are now standing on the test-bench", wrote an author who is close to the Free Democratic Party.)

In his much-read work "Wohim Treibt die Bundesrepublik?" ('Where Is the Federal Republic Drifting To?') Karl Jaspers, the famous existentialist philosopher, put the parties in the pillory. It is important to note that this work appeared in 1966 — ie, at the early stage of the students' revolt and of the extra-parliamentary opposition. Jaspers criticised the real functions and methods of the parties. He spoke of the degeneration of the parties which were actually meant to be the people's organs into organs of the State, alienated from the people, into authoritarian oligarchies. He even spoke of the "absolute rule" of the parties. Jaspers' criticism was particularly aimed at the inner oligarchy in the parties, which does not give even the small circle of party members a genuine possibility of co-determination. He criticised the ritual of elections that does not give the electors any real alternatives, and the very generous use that parties make of the power entrusted to them by the people, and against the inadequate information system. What Jaspers euphemistically called "an inadequate information system" was called by the extra-parliamentary opposition "information manipulation", for the party oligarchs not only controlled the party press, but also enjoyed the voluntary loyal service of the so-called free press. The report on the struggle of the citizens of Kaiserstuhl against the APP (Wyhl) gave ample proof of that.

The Great Coalition indeed gave the parties much more power than what Jaspers meant when he spoke of the "absolute rule" of the parties. It produced among the rulers "that degree of equanimity that easily lures one to ignoring one's own weaknesses" (home minister Benda). But the Great Coalition also led to an inner-party struggle by party-members for emancipation and participation in the decision-making process. It is well-known that many party-members, especially of the SPD, did not agree to the Great Coalition. Forces which the parties could not attract and keep because of the above mentioned reasons joined the CI-movement, among whom were many frustrated party-members. The CIs are thus the self-help organisations of the citizens. They organise and articulate particular social interests vis-a-vis the State and other interests. But an important precondition for this positive evaluation of the CIs' role is that all socially relevant interests be organised and articulated, which in fact does not happen. Economic interests are easy to recognise, and the definite groups of concerned people are conscious of such interests. It is therefore easy, for example, to organise workers demanding higher wages and industrialists demanding lower interest rates into strong unions. But interest-groups like children, old people, patients, disabled persons, social groups like convicts and ex-convicts, and groups such as future consumers of medicines, foodstuffs, air and water, are more difficult to notice and organise.

Nevertheless, the results of the June 1978 elections to the provincial legislatures of Hamburg and Lower Saxony gave another demonstration of the significance of CIs in the political life of West Germany. The numerous CIs for the protection of the environment, in which the New Left and other radical Left elements take part (chiefly those against APPs) had jointly set up lists of candidates for these elections. In Hamburg, where the Left dominates the movement, the non-left CIs had set up a separate list of their own. In Lower Saxony, the list was called "The Green List — Protection of Environment". In Hamburg, the list of the non-Left CIs was called by the same name, the list of the Left CIs was called "The Chequered List — Resist". Surpassing their most optimistic expectations, the CI lists got 3.9 per cent votes in Lower Saxony and 4.5 per cent in Hamburg (3.5 per cent of the Chequered List + 1 per cent of the Green List): a total of more than 200,000 votes out of about 5 million votes polled. Their record has to be considered remarkable, especially when considered along with the debacle of the Free Democratic Party — for which the CIs were at least partly responsible. The share of the FDP (the third biggest party in West Germany) in the votes went down to less than 5 per cent, and it was consequently excluded from the two provincial legislatures.

More significant, however, is the social and age-wise composition of the voters who supported the CIs. According to an Infas-enquiry, the voting was rather "a movement of the young people". In Hamburg, 25 per cent of the voters in the age-group 18-25 years voted for the CIs (in Lower Saxony 14 per cent); of the voters in the age-group 26-34 years 14 per cent voted for them (in Lower Saxony 7 per cent). Interesting, too, is that, both in Hamburg and Lower Saxony, most of these voters were students and middle-class people, not many were workers.

In contrast to the success of the CI groups the German Communist Party, which had set up its own lists suffered heavy losses. Its percentage of votes went down from 2.2 per cent to 1 per cent in Hamburg and from 0.4 per cent to 0.3 per cent in Lower Saxony.

Together with the debacle of the FDP if the CIs take its place by winning around 8 per cent of the votes, they would have enough representatives in the legislatures to be able to effectively decide — just as the FDP today — which party, in case none gets an absolute majority (which is very much the case in West Germany), would form the government. Realising this threat, some politicians of the ruling parties are already saying, in order to pacify the environmentalist voters, that APPs are not really necessary, that they would not go ahead with their construction. Some have called the CI-voters "protest voters". But it is also very probable that many have voted for an entirely new type of society.

Wrong Focus

M S A Rao

Village Studies in the Third World edited by Biplab Dasgupta: Hindustan Publishing Corporation, Delhi, 1978, pp 227, Rs 60.

VILLAGE studies came into prominance after the emergence of independent nations in the third world. Sociologists and social anthropologists, economists and especially agricultural economists and political scientists have been interested in the problems of rural development and understanding local level processes and changes. The Institute of Development Studies of the University of Sussex has made a significant contribution in bringing together 2,000 existing studies of villages in Africa, Asia and Latin America. The Institute, in collaboration with the Agro-Economic Research Centre of Delhi, organised a conference in December 1974 and the present volume is based on the papers submitted to the conference.

Biplab Dasgupta, the editor, has organised fourteen papers under five sections: Villages and Village Studies, Village Studies in India, Village Studies in Africa and Latin America, Organisational and Methodological Issues and Cross Section Analysis of Village Level Data. One can identify two basic issues to which most contributors allude, namely, importance and methodology of village studies, and rural development — causes and consequences.

Many contributions focus on the importance of village studies and methodology rather than on substantive issues. They raise the same set of questions which preoccupied social scientists in the 1950s — questions like village as the unit of study, fact-finding versus problem-oriented studies and survey versus participant observation technique in village studies. Michael Lipton (p 15) outlines four aims of rural research: to discover facts, to generate hypotheses, to test hypotheses and to indicate the likely results of a policy. He makes a plea for switching over to problem-oriented village studies in India where the knowledge about the rural situation is considerable. Several contributors have discussed the merits and demerits of survey and participant observation techniques, and micro and macro studies. M N Srinivas says that micro and macro studies can be made to support and strengthen each other (p 45). M P Moore and Michael Lipton argue that in order to overcome the limitation of hierarchically organised research, the field work should be conducted by persons sufficiently senior and competent (p 123). T Scarlett Epstein in her paper on "Re-surveys and Re-studies of Rural Societies" discusses such problems in re-studies as new versus old researcher, identification of earlier informations and research focus. She rightly points out that village re-studies help better understanding of the complex interaction of different socio-economic variable responsible for rural development over a period of time.

There are only four papers, out of fourteen, which tell us something about what is happening in villages. Against the backdrop of Spanish and Portuguese colonialism in Latin America for three centuries, Andrew Pearse points out the exploitative relations between land-owners or officials and peasants, and between the town, being the commercial market-administrative centre, and the peasant. Cleave's study of labour utilisation is based on about fifty studies from different parts of Africa. It shows that there has been a considerable growth in small scale agriculture because of commercialisation. But mechanisation of agriculture has been only beneficial to the large farmers and not to small holders. G Parthasarathy's study helps in understanding the basic conditions of rural poverty. Discussing the conflict between growth and equity, he gives data from his own researches in a village in West Godawari district. Here the land market, retail market, credit market, input market and labour market — all these reinforced each other in a manner disadvantageous to the small farmers and landless labour. Poverty is only perpetuated by agricultural growth. Biplab Dasgupta and Roy Laishley show, in their analysis of migration from Indian villages, that migration is associated with both 'village base' and 'urban relations' factors. The village with a high rate of migration is characterised by a pattern of unequal resource distribution. A major cause in migration is intra-rural inequality. This analysis of migration flows is an advance over the simplistic and general push and pull factors approach. All the substantive studies, in a limited way, point to the growing inequalities in rural society, their causes and consequences.

It is unfortunate that the international conference, instead of devoting its attention to such substantive issues which are vital to village studies, on a comparative scale, wasted most of its resources in discussing methodology with very little gain.

Subjects and Masters

L Dewani

Gandhi and Civil Disobedience: The Mahatma in Indian Politics 1928-34 by Judith M Brown, Cambridge University Press, 1977, pp 414, £ 15.50.

DURING the last few years there has been a spate of historical writings by western scholars on different aspects of histroy of India during the period when Gandhi dominated Indian politics. These studies undoubtedly break new grounds as they reveal the vastness of the hitherto unexplored vistas of historical research relating to India's immediate past. These new historians are also trendsetters in that they turn their close attention to regional and local diversities and dissentions of the period which, according to them, constituted the warp and woof of Indian politics

There is force in the argument of these historians that local drives and impulses lent a new dimension to the overall situation. Yet, is it also not an act of arbitrary drawing of a line to say that the entire gamut of Indian political activity of the Gandhian period can be seen clearly through the prism of local and regional politics? If the study of nationalist slogans or jail-going rituals of thousands of persons gives an unclear picture of the ex-

tremely complex phenomenon that the nationalist movement was, so also does the relatively fixed gaze at the warts and the weeds noticeable in the vast superstructure which the British-Indian encounter helped raise itself through its long tumultous career, and which when not being actively fought out through political campaigns, was in evidence in a thousand little ways. Therefore, to say, as these historians do, that the Indian political development cannot be simply explained in terms of a nation's frustration at imperial rule and the imperialist reistance to nationalist claims is to leave out of reckoning the main strand in the uneasy and, at times, very hostile relationship that subsisted between the rulers and the ruled.

In the book under review which presents a very remarkable collection and use of vast and variegated source-material, the author has shown a lack of understanding of the basic nature of the relationship that subject people have had with their alien rulers in the present century. The imperialist governments did not have to fear any organised armed revolts or even the insurrectionary and subterranean activities of some youths; and even less did they have to fear the councillors' and constitutionalists' polemics. It was the onrush of new ideas which particularly attracted the vast hordes of unemployed middle class youth who, in turn, swelled the ranks of various political organisations and formed their inner hard core, that the imperialists had increasingly to reckon with. It was this reality which led such hard-boiled imperialists like Lord Hailey and Sir Harry Haig to admit, immediately after their successful crack-down on the civil disobedience movement of early 1930s, that any future government in India will be a socialist government.

In looking for regional character and degree of support Gandhi's civil disobedience campaign aroused, Judith Brown argues most forcefully that the campaign was particularly strong in those areas where it suited the purpose of local leaderships or provided a vent for local strains. This is the line of the argument pursued by her in her earlier work, "Gandhi's Rise to Politics", on the background of the non-co-operation movement of early twenties. In that work she was, however, more devastatingly brutal in her conclusions. She had asserted that the movement took the colour and complexion from the regions and localities as the local level leadership tried to dovetail the local issues into the broader political questions which lent a chameleon-like appearance to the non-co-operation movement. She did not agree that during that period when national consciousness was not sufficiently roused, an Assamese or a UP hillsman saw greater meaning in Gandhi's programme when it seemed to offer solutions to the particular problems that faced him. Rather, she argued that the leadership at the local level exploited Gandhi's call for non-co-operation for starting local agitations to butteress their own local standing and also incidentally get some redressal for local grievances.

In the present book, Brown, makes a very bold assertion that Gandhi's expectations from his followers to work with him for the country's moral, social and political emancipation were bound to result in frustration as his entire following had aims and aspirations contrary to his ideals. His followers crowded round him or went away from him as and when it suited them. According to her, they all reacted to Gandhi's ideas and plans of action with "deliberate calculations" and gathered round him only when they could find his political campaigns capable of giving a push to their particular ambitions and aspirations.

Is this not a highly biased conclusion? To say that all those who joined Gandhian campaigns were only motivated by some local, sectional or some kind of material interest is to show the same blindness of approach as is evident in the charges against Indian historians — that their writings of this period were simplisitic generalisations and hagiographic in approach.

To count the number of rotten eggs in the Congress basket by relying for evidence on understandably garbled reporting and accounts contained in police reports and officials' minutes, or, on the private and personal correspondence of Tej Bahadur Sapru, M R Jayakar and V S Srinivasa Sastri — leaders with no following in the country — is to deliberately look for evidence which will support the highly debatable hypothesis that the 'so-called' unity and cohesion achieved in the Congress ranks and its working is a figment of imagination.

Brown's study also prompts another question as to whether it could not be possible for the subject people to simultaneously carry on the dual task of opposing alien rule as well as fight for the protection of their local, petty interests — as did the bureaucracy both in India and back 'home', which while keeping its grip firm over the ruled, also merrily carried on its own petty feuds and infighting in the services.

National Languages Policy and the Case for Nepali

Surendra Munshi

Tridib Kumar Chakrabarti

This article examines developments towards the formation of a policy with respect to the national languages of India. Through a tortuous route, it has been acknowledged at the policy level that Indian society is multilingual and that all the languages of India have a right to grow. In this context, the Eighth Schedule to the Constitution has come to assume importance as representing the recognised national languages of India.

However, for various reasons, the profession of linguistic pluralism has not been taken to its logical conclusion; on the contrary, it has been undermined in the recent past. Secondly, the criteria for selection of certain languages in (and exclusion of other languages from) the Eighth Schedule remain very unclear.

In this context, the case for constitutional recognition of the Nepali language that is being insistently presented by the Indian Nepalis deserves attention. This article examines this case for Nepali with a view to reaching a conclusion that has relevance for policy and legislative action.

I
Towards a National Languages Policy

THE specific provisions contained in the Constitution of India on the language question are to be found in Part XVII of the Constitution, entitled, 'Official Language'.[1] These provisions, Articles 343 to 351, are organised in four chapters: Chapter I, 'Language of the Union' (Articles 343, 344); Chapter II, 'Regional Languages' (Articles 341 347); Chapter III, 'Language of the Supreme Court, High Courts, etc' (Articles 348, 349) Chapter IV, 'Special Directives' (Articles 350, 351). To the Articles 344(1) and 351 has been appended the Eighth Schedule to the Constitution. Besides, the Constitution (Seventh Amendment) Act, 1956, and the Constitution (Twenty-first Amendment) Act, 1967, are relevant for consideration of this part.

As with other parts of the Constitution, it is best to view this particular part in the context of the perspective of the Constitution. The Preamble to the Constitution, though by itself not enforceable in a court of law provides a brief resolution on the perspective. Jawaharlal Nehru's 'Objective Resolution' that was adopted by the Constituent Assembly on January 22, 1947, provides an earlier statement.[2]

More concretely, the Constitution guarantees the following cultural and educational fundamental rights. Article 29 guarantees the right of any section of the citizens to preserve its "distinctive language, script or culture". Article 30 further guarantees the right of all minorities, "whether based on religion or language", to establish and administer educational institutions, with the additional safeguard that the State shall not, in granting aid to educational institutions, discriminate against any religious or language minority.

To turn now to the specific constitutional provisions relating to the language issue, it is understandable that the makers of the Constitution were concerned with the role of English in independent India. The problem was to identify the "official language" of the Union. Hindi in Devanagiri script was prescribed as the "official language" of the Union, subject to the continuance of English for the "official purposes" of the Union for a limited period of fifteen years from the commencement of the Constitution (Article 343). Article 345 clearly allows the Legislature of a state to adopt any one or more languages in use in the state (or Hindi) as the language or languages to be used for all or any of the "official purposes" of that state in place of English. Further, by Article 347, the President is authorised to direct the use of a particular language to be also "officially recognised" throughout a particular state or any part of it for such purposes as he may specify on being satisfied that a "substantial" part of the population of a state desires the language spoken by it to be recognised by that state.

The 'Special Directives' are particularly relevant in this respect. It is clearly stated in Article 350 that every person shall be entitled to submit a representation for the redress of any grievance to any authority of the Union or a state in any of the languages "used" in the Union or the state. Articles 350A and 350B, inserted by the Constitution (Seventh Amendment) Act, 1956, direct that adequate facilities shall be provided for instruction in the mother tongue at the primary stage of instruction to children belonging to "linguistic minority groups", and also that there shall be a Special Officer for linguistic minorities to be appointed by the President who will investigate all matters relating to the safeguard provided for linguistic minorities under the Constitution. Finally, Article 351 provides that it shall be the duty of the Union to promote the spread of the Hindi language and to secure its enrichment by assimilating without interfering with its genius, the forms, style and expressions used in Hindustani and in the other "languages of India" specified in the Eighth Schedule, and by drawing, wherever necessary or desirable, for its vocabulary, primarily on Sanskrit and secondarily on other languages.

The Eighth Schedule originally specified the following 14 languages: Assamese, Bengali, Gujarati, Hindi, Kannada, Kashmiri, Malayalam, Marathi, Oriya, Punjabi, Sanskrit, Tamil, Telugu and Urdu. By the Constitution

(Twenty-first) Amendment Act, 1967, Sindhi was added to the list and that brought the total of languages mentioned in the Eighth Schedule to fifteen. It is generally believed that the significance of the Eighth Schedule lies in providing a list of languages from which Hindi is directed to draw the appropriate "forms, style and expressions" for its enrichment. It is, however, well to remember that the Eighth Schedule also pertains to Article 344(1) which provides for the constitution of a Commission by the President to make recommendations regarding various important matters with respect to the language issue, including the language to be used for the proceedings in the Supreme Court and every High Court as well as for purpose of legislation (Article 349).

With respect to these constitutional provisions, we are faced with considerable ambiguity. Thus, for instance, the Constitution of India does not provide a clear definition of the "regional" languages. Are the languages listed in the Eighth Schedule to be considered as the "regional" languages of India? It is instructive to note that the articles in the chapter on the "Regional Languages" do not refer to the Eighth Schedule. We are left with only a general description of a regional language, through Articles 345 to 347, namely, a language in "use" in a particular state. It is also important to note that the Eighth Schedule bears the simple title of "Languages". In fact, Article 351 identifies the languages listed in the Eighth Schedule as "languages of India". What about the other languages of India? The framers of the Constitution were evidently aware of these problems and, therefore, they did not confine themselves to the languages of the Eighth Schedule in such an important article as Article 350. However, it does not make the matter any clearer and the problem is confounded by our not having in the Constitution a clear rationale for selection of certain languages in (and exclusion of other languages from) the Eighth Schedule.

The ambiguity faced in a textual reading of the Constitution of India is confirmed by the evidence that, right from the beginning, the Constituent Assembly was confronted with the controversial issue of language. The issue was first discussed at length during November 21-23, 1946, and continued to provoke controversy almost to the date of the enactment of the Constitution. The provisions on language, thus, provide an uneasy compromise.[3]

In independent India, as is to be expected, the language issue has not been unrelated with the political life of the country. A recent study explores the bearing of language politics on the concrete task of policy formulation and implementation.[4] The uneasy compromise of the views that have been debated in the appropriate forums refers more basically to the conflict of interests of different language communities in the country. At the policy level, the problem has been, what Das Gupta has called, the simple "technocratic" assumption,[5] particularly prominent in the early phase of planning, of many of the policy makers that language planning can be divorced from the broader social processes at work in the country. The inadequate appreciation of the complexity of these processes, particularly with respect to the less familiar regions, as we shall see later in this article, has made the task of language planning difficult in the country. The additional problem has been the impatience of certain sections of leadership and the people.

It is in this context that we can view the fact that the issue of language nomenclature itself has exercised considerable public attention. The categories of "official" language, "state" language, "national" language, "common" language, "link" language, etc, have been largely taken out of the discussion that took place during the national movement and debated later with renewed excitement without necessarily any additional analytical clarity invested in them.[6] The fierce nature of language controversy is best illustrated by the fact that the provision of having Hindi as the official language of India was formally adopted with the majority of just one vote by the Constituent Assembly, and that thereafter it has never been accepted unanimously by the people of the country as a whole or any of their representative bodies.[7] The tendency amongst the more aggressive supporters of Hindi to equate freedom of the country with the immediate removal of English and the imposition of Hindi as the only official and national language of the country has had rather unfortunate implications on the process of consensus formation on language policy.

However, it will be wrong to infer from the above argument that there has been no development over the years towards the formation of a language policy and that the policy making has been entirely unresponsive to the people's movements.[8] Thus, for instance, with respect to the languages

TABLE 3: WHO IN YOUR FAMILY FIRST MIGRATED TO INDIA?

(ii) E=Ego=Respondent; R=Relative.

of the Eighth Schedule, the *Report of the Official Language Commission of 1956* refers to these languages, with the exception of Sanskrit, as the "regional" languages.[9] In 1959, we find Nehru assuring the Lok Sabha that the Eighth Schedule to the Constitution was not an exhaustive list of the 'Indian languages'. "One must not think that the non-inclusion of a language in the list means that it is not an Indian language or is not a language used in India."[10] *The Report of the Committee on Emotional Integration, 1962*, refers to the languages of the Eighth Schedule as having the "status of national languages".[11] During the debate on the Official Languages Bill, 1963, Nehru referred to the languages of the Eighth Schedule as "national languages": "The makers of our Constitution were wise in laying down that all the thirteen or fourteen languages were to be national languages. There is no question of any one language being more a national language than the other. Bengali or Tamil or any other regional language is as much an Indian national language as Hindi."[12] Suniti Kumar Chatterji, who was himself a member of the Official Language Commission, wrote in 1963 that the expression "national languages" had come into use only recently with respect to the languages listed in the Eighth Schedule and that the old expression "regional languages" was no longer encouraged.[13]

Through a tortuous route, by 1963, it was clearly admitted at the policy level that India was a multilingual society and that all the languages of India "must grow in their own regions".[14] With respect to the "more widespread Indian languages", listed in the Eighth Schedule, it was officially recognised that they had an equal status as "national languages".

By the Official Languages (Amendment) Act, 1967, the language policy stood further clarified. This act provided for the continuance of English, in addition to Hindi, for all official purposes of the Union for which it was being used prior to the expiry of the period of fifteen years from the commencement of the Constitution. Moreover, this act specified that English would continue to be used for purposes of communication between the Union and a state which had not adopted Hindi as its official language. Above all, it gave statutory guarantee, through Section 2, Sub-section (5), that English would remain in use for the specified official purposes until "resolutions for the discontinuance ... have been passed by the Legislatures of all the states which have not adopted Hindi as their official language and until after considering the resolutions aforesaid, a resolution for such discontinuance has been passed by each House of Parliament."[15]

Along with this act, a Resolution on Language Policy, moved by the then Minister of Home Affairs, Y B Chavan, was also passed.[16] With the resolve for a more intensive and comprehensive programme to be prepared and implemented for "accelerating the spread and development of Hindi, and its progressive use for various official purposes of the Union", it was also resolved that, for the "major languages of India", as specified in the Eighth Schedule to the Constitution, concerted measures should be taken by the Government of India, in collaboration with the state governments, for their co-ordinated development so that they could "grow rapidly in richness" and become "effective means of communicating modern knowledge". In order to promote the sense of unity and to facilitate communication between people in different parts of the country, it was further resolved that the necessary arrangements should be made, in accordance with the three-language formula, for the study of a modern Indian language, preferably one of the southern languages, apart from Hindi and English in the Hindi-speaking areas, and of Hindi along with the respective regional language and English in the non-Hindi speaking areas. Moreover, it was admitted that the just claims and interests of persons belonging to the public services of the Union were to be fully safeguarded.

These claims were to be safeguarded by the resolution that compulsory knowledge of Hindi should not be required at the stage of selection of candidates for recruitment to the Union services or posts, except when

necessary, and by resolving that, "all the languages included in the Eighth Schedule to the Constitution and English shall be permitted as alternative media for all-India and higher central services examinations after ascertaining the views of the Union Public Service Commission on the further scheme of the examinations, the procedural aspects and the timing".

There has, thus, been a growing appreciation of the importance of supporting all the regional or national languages of the country. At this stage, however, they are far from having achieved their rightful position in the national life. A major reason for this, no doubt, is the relatively underdeveloped status of these languages, including that of Hindi, particularly in the sphere of science and technology. Yet one more reason, no less significant for languages other than Hindi, has been the inability of the Central government to take to its logical conclusion and to give a concrete shape to its profession of linguistic pluralism. In this respect, the persistent fear has been that of the political disintegration of the country. Whereas no one disputes the value of maintaining the unity of the country, there has been controversy with respect to the best means of promoting it.

II

Importance of the Eighth Schedule

We have noted above that the Eighth Schedule to the Constitution has increasingly come to represent the recognised "national" languages of India. In the context of the growing importance of the national languages in the country, such a recognition has its own merit. Thus, for instance, we have seen that in the Policy Resolution that was adopted along with the Official Languages Amendment Act, 1967, the languages of the Eighth Schedule were accorded a special status.

It was this consideration that was highlighted in favour of Sindhi during the Lok Sabha debates in 1966 on the question of granting Sindhi "a place of pride in our Constitution".[17] References were made to the constitutional provisions of Articles 344 (1) and 351 and it was pointed out that so long as Sindhi was not included in the Eighth Schedule no "directive for the development of that language" could be provided. More specifically, it was pointed out that in these days when we realised that the medium of instruction must be in the mother tongue the recognition of Sindhi was imperative. In general, a plea was made for facilities in order to ensure the growth of Sindhi along with the other recognised languages of the country. The demand for constitutional recognition of Sindhi was considered legitimate even though it was not disputed that the Central government had been in effect "treating Sindhi as one of the national languages of the country".

More than the rational calculation of the facilities afforded to the language by its recognition there was the need for the House to appreciate the *feelings* of the Sindhis. U M Trivedi, who moved the Bill, recognised this point clearly. He said, "Sentimentally, I think they are right. Morally, it is our duty to respond." It is in this context that we can understand the sympathy that was shown for the people who were "uprooted" and felt a "vacuum" in their lives. This understanding was not expressed independent of the national objective. As one of the members put it, "In a polyglot country like ours it is possible to conceive of language as a great disrupter to the unity of the country; but it is also possible to conceive of language as a cementing force for the national integration of the country .... Sindhi language could also contribute its mite to the cause of national integration."

The last point made above has not gone unrecognised at a general level. Thus, M P Jain notes, "An unstated idea underlying the Eighth Schedule might, however, be to name the languages which need to be developed. Mention of these languages in the Constitution however gives a psychological and emotional satisfaction to the proponents of these languages".[18]

Given the importance of the Eighth Schedule, as noted earlier, the policy with respect to the selection of certain languages in it, however, remains unclear. Nehru's assurance that the non-inclusion of a language in the list does not mean that a language is not an Indian language is valid. However, the criterion of a language being "more widespread" in order to qualify for recognition does not appear to have been applied in a mechanical manner. For one thing, should this have been the case, Sanskrit could not have been included in the Schedule. Secondly, in discussion on the inclusion of Sindhi, the argument with respect to its number of speakers did not feature in a prominent manner. What was actually emphasised was that, it was a language of the people who were of our land, this language was a part of the great heritage of the Indian culture, it had its own developed literature, and, above all, it needed particular sympathy because of the peculiar condition of its speakers who had paid the price of partition and had substantially contributed to the national life.

III

Present Linguistic Situation

As in 1961, the Census of India, 1971, recorded more than 3,000 languages and mother tongues in the country. On the face of it, India appears to be a babel where not even God can differentiate the several speeches of men, much less, formulate a language policy. Fortunately for the planners, the position is not so confusing on a closer examination. Thus, the 1971 Census shows that the languages (inclusive of mother tongues grouped under each) specified in the Eighth Schedule to the Constitution collectively cover 95.37 per cent of the total population of India, leaving only 4.63 per cent of the population to the "other" languages (inclusive of mother tongues where so grouped).[19]

Just on the basis of these figures, it is possible to jump to the opposite conclusion, for in a country as large as India, 4.63 per cent of the population refers to more than 25 million people, almost double the population of the whole of Australia. Secondly, the all-India figures conceal the fact that in several units of the country the "other" languages claim more speakers than are claimed by the Eighth Schedule languages. Thus, there are more such speakers in Arunachal Pradesh (87.01 per cent), Dadra and Nagar Haveli (83.76 per cent), Goa, Daman and Diu (65.85 per cent), Manipur (96.97 per cent), Meghalaya (86.12 per cent), Mizoram (89.68 per cent), Nagaland (92.68 per cent) and Sikkim (96.39 per cent).[20] Thirdly, some caution is required in interpreting the Census data with respect to the grouping of mother tongues under the Eighth Schedule and "other" languages.

The grouping was done on "the basis of information readily available or in the light of studies already made".[21] For grouping purposes, only

those identifiable languages or mother tongues were considered which returned 10,000 or more speakers each at the all-India level. In all, 106 such languages or mother tongues were identified; of these, 64 were grouped with the Eighth Schedule languages and remaining 42 with the "other" languages. Such grouping may prove controversial. Thus, for instance, with Hindi alone 46 such languages were grouped, including, to name just two, Garhwali and Maithili. Now, Garhwali was not so grouped with Hindi in the 1961 Census when it had claimed over 8 lakh speakers.[22] There does not appear to be any justification in grouping it this time with Hindi, just as there is little validity in similarly grouping with Hindi other Central Pahari languages, as well as such languages of the Western Pahari group as Chambeali, Mandeali, Kulvi, Sirmauri, etc, each of which claims significant number of speakers. With respect to Garhwali, its grouping with Hindi is even more striking when we consider that in one of the 1971 Census publications, it is specifically recommended that, "Nepali and Garhwali figures should be collectively represented".[23] Similarly, with respect to Maithili, as is well known, there has been an insistent demand for its inclusion as a separate language in the Eighth Schedule and the leaders of the Maithili movement, drawing from the authority of Grierson, have claimed that it is the most important language of north Bihar, if not the whole of Bihar, and is sufficiently distinctive from Hindi or Bengali.[24]

In sum, although the languages of the Eighth Schedule cover a substantial portion of the population of India, they do not completely cover the complexity of the linguistic situation. The demand for inclusion of additional languages in the Eighth Schedule needs to be viewed with this perspective on the linguistic situation in India. It is with this understanding that we turn our attention to a closer examination of one such demand being made at present.

IV

The Case for Nepali

One of the recent representations of the case for Nepali was made by a delegation of the Indian Nepalis when it met the Prime Minister in New Delhi on September 29, 1977. The delegation consisted of representatives of different branches in India of the Akhil Bharatiya Nepali Bhasha Samiti (ABNBS), a cultural organisation for the promotion of the Nepali language. The communication from the General Secretary of the ABNBS to the Prime Minister presents the following case for recognition of Nepali in the Eighth Schedule to the Constitution of India.[25]

(i) The inclusion of Nepali represents "the long cherished aspiration of over five million Indians with Nepali as their mother tongue" and the "non-inclusion of Nepali in the Eighth Schedule has created a sense of deprivation in the minds of a large section of people in the country and it is natural for them to suffer from a sense of insecurity. Many privileges accruing from the constitutional recognition of Nepali will help the development of a liguistic minority and will go a long way to bring about a deep emotional integration in our nation".

(ii) The demand is being made for a long time now with the support of leaders from social, cultural and political spheres. In fact, the communication reminds the Prime Minister that when the member of Parliament representing the district of Darjeeling submitted a memorandum to the government in December 1971, seeking the constitutional recognition of Nepali as a language of the Eighth Schedule, 74 members of Parliament, including some of the present cabinet ministers, had supported the demand and signed the document.

(iii) Nepali already enjoys the status of an official language in West Bengal and is spoken as mother tongue by the majority of people in Sikkim. The West Bengal Legislative Assembly has already adopted a resolution recommending to the Union government to accord constitutional recognition to Nepali and to include it in the Eighth Schedule to the Constitution, a move soon going to be taken by the Legislative Assembly of Sikkim as well.

Similar petitions had been made several times in the past. Thus, the President and members of the ABNBS, welcoming the former Prime Minister, Indira Gandhi to Darjeeling on November 21, 1975, pointed out that the Samiti relied on the "positive assurances" given by her to its delegates on earlier occasions and hoped that the government would at last fulfil the "desire and aspiration" of the Indian Nepalis.[26]

The meeting with Morarji Desai proved unhappy for the representatives of the ABNBS. A printed pamphlet was brought out by the main office of the ABNBS from Darjeeling, soon after the meeting, with the intention of giving a verbatim report on the meeting.[27] It appeared from this report that Morarji Desai had taken a rigid stand with respect to the demand of the delegates and categorically expressed himself against any move to enlarge the Eighth Schedule, for he did not want to open the door for a score of tribal languages. What caused widespread resentment, according to this report, was the blunt manner in which Morarji Desai conducted the meeting and certain damaging comments that he made.

An all-India 'protest day' was announced against this stand on December 11, 1977, with particular concentration in the hill areas of Darjeeling district. Except for the Gorkha League, which organised a successful bandh on December 5 separately, all the other political parties in the district of Darjeeling, including the local unit of the Janata party, along with several social and cultural organisations, trade unions, student bodies, etc, unitedly participated in the protest. It was a success judging by the number of persons who participated in the processions and meetings, the peaceful manner in which the protest was expressed, and, above all, by the united manner in which the hill people were joined by the plainsmen in asserting the demand for the constitutional recognition of Nepali.[28]

The resentment, however, continues. It finds expression in the recent pamphlet of the ABNBS, which was brought out after the Second All-India Conference of the Samiti, held at Darjeeling, on April 14-16, 1978. It was in this conference that an All-India Committee of Indian Languages Demading Constitutional Recognition was formed to jointly work for inclusion in the Eighth Schedule of Dogri, Konkani, Maithili, Manipuri, Nepali and Rajasthani.[29]

In the pamphlet, "Case for Constititional Recognition of Nepali · Eighth Schedule What are the Norms?", the question that has been insistently asked is, "What are the criteria for the Union Government's including some languages and not including others in the Eighth Schedule?"[30] On the basis of the possible criteria such as regional concentration, sizeable population, developed literature, aspiration of the people, etc, the pamphlet shows that

there is a strong case for recognition of Nepali in the Eighth Schedule. It also tries to correct a misconception regarding the early history of the Indian Nepalis. "They who claim to be delvers of the past and yet describe Indian Nepalis in Darjeeling, Sikkim, Dooars and adjacent areas as 'Settlers' betray their animosity and blatant ignorance of history of the region. The Rongs (Lepchas) and the Jongs (Limbus) were original inhabitants of Sikkim, and the Jongs (Limbus) are no other than a Nepalese tribe that has commingled with other Nepalese tribes, such as the Magars originally inhabiting the area around Magarjong in the district of Darjeeling, to make up Nepali nationality in India." Finally, the pamphlet asks: "Do you want only to grab land in this Nepalese region and throw out the Nepalese People? Keep them perpetually under conquest and subjugation? For that is what the Union government's refusal to accept the legitimate Nepalese demand amounts to."[31]

Similar sentiments are expressed in the special issue of *Hamro Bhasha*, a fortnightly of the ABNBS, which was brought out on the occasion of the Second All-India Conference of the Samiti. Thus, Ugyen Golay clarifies in his article, 'Some Aspects of the Demand for Constitutional Recognition of the Nepali Language', "The legitimate claim for inclusion of Nepali in the Eighth Schedule of the Constitution is reflective of the expressed intent and strong desire on the part of Nepali speaking Indian citizens, to associate themselves, in full measure, in the mainstream of national life, and thereby contribute towards the growth of meaningful and real integration at the national level.... The mischievous view that the government considers it a foreign language gains currency in the absence of a definite language policy. It is in this light that the demand for the inclusion of Nepali in the Eighth Schedule connotes, besides the assertion of right, the very right to such assertion as equal citizens of India."[32] An important recent development has been the passing of a resolution by the Legislative Assembly of Sikkim, similar to the resolution passed by the West Bengal Legislative Assembly earlier, recommending to the Union government that it should accord constitutional recognition to Nepali by including it in the Eighth Schedule to the Constitution. A P Pathak, member of Parliament from Darjeeling, referred to this development in the Rajya Sabha on November 21, 1977.[33]

V

Selected Research Findings

In the preceding section, we have noted that there is a belief amongst the Indian Nepalis that "persecutory" situations exist in this country and that there are instances when they are put to considerable difficulties by being regarded as "foreigners" or mere "settlers" in this land. It is not our purpose to examine here the validity of this belief: for the present, we present here some selected findings from a survey, conducted in the course of this study, that have direct bearing on the problem being discussed in this article.

In a separate work, Munshi and Lama have argued that the study of the identity of a group is basically a matter of inference rather than a problem that can be studied by eliciting clear responses to direct questions on the point -- that is, by asking for instance, "Who are you?". Group identity obviously refers to social identity of which 'self conception' is the personal counterpart. To a sociological perspective, what is more relevant than a study of the ego identity of an individual is the effort that relates different kinds and levels of subjectivity with cultural and social life that conditions the identity of a group.[34]

To attempt such a linkage is beyond the scope of this article. In the survey from which we draw our findings with respect to the cultural and social life of the Indian Nepalis, we have concentrated on a small but selected number of questions.

The survey was conducted during the winter of 1974. It was confined to the hill areas of the district of Darjeeling, which has the highest concentration of the Indian Nepalis. In all, three tea estates were purposively selected, located at varying distances from Darjeeling, the headquarter of the district. Our first case is Happy Valley TE, falling within Darjeeling Police Station of the Sadar Sub-division of the district; our second case is Ging TE, also covered by Darjeeling Police Station; and our third case is Tharbu TE, falling within the jurisdiction of Mirik Police Station of Kurseong Sub-division. Happy Valley is closest to the town of Darjeeling, followed by Ging and the farthest from the town is Tharbu, over 40 kilometres away from the town, located on the outskirts of the district, alongside the long open border of Nepal. In terms of population size, Happy Valley is the smallest, Ging occupies an intermediate position, and way ahead is Tharbu, which happens to be one of the biggest tea estates in Darjeeling district.[35]

Almost all our respondents were working in the garden or the factory of their respective tea estates, more generally in manual occupations. Of the 411 persons interviewed and for whom complete schedules were returned, 345 were male and 66 female; 394 reported as married and only 17 were unmarried. With respect to the mother tongue, 402 out of 411 respondents gave Nepali as their mother tongue; the remaining nine mentioned different "other" mother tongues, including some of the Nepali 'tribal' speeches. There were two Lepchas in our coverage, one of whom mentioned Nepali as his mother tongue; of the three Biharis covered, two mentioned Hindi and one gave Nepali as his mother tongue. With our questions on the language usually spoken at home/outside the house, we enquired further about the language actually in use. Whereas 401 respondents were found usually speaking Nepali at home there were 403 respondents who specified that they usually spoke Nepali outside the home as well.

The responses with respect to *jati* and *jat* (Tables 1 and 2) give a more differentiated picture. (Here we should explain that the term *jat* refers to "caste" or "tribe" in the Nepali language. The term *jati* has a broader meaning; in our context, it may be taken to mean "nationality".) 83 per cent of our respondents have chosen to identify their *jati* as Nepali or in related terms. However, regarding *jat*, the responses have been generally in terms of Nepali tribal or caste names and only four respondents have mentioned Nepali here. The dominance of responses in terms of tribal names over caste names is to be understood with reference to the overwhelming majority of Rais, Limbus, Tamangs, etc, in our coverage, which is consistent with the general population profile of the hill areas of Darjeeling district.

When asked to specify the place of their birth, the majority of respondents (53 per cent) mentioned "present place", meaning by it the tea estate where they were located at the time of interview. As to the remaining respondents, 32 per cent were born within Darjeeling district; thus, only 15 per cent were born outside the district. To the question whether the respondent had ever travelled outside the district, 48 per cent answered "no", and of the remaining 52 per cent who had undertaken such a visit at least once, only 13 per cent mentioned a place in Nepal, the others (87 per cent) had visited other parts of India. A majority of those who had visited Nepal came from Tharbu, a tea estate, as noted above, located alongside the open border of Nepal.

Considering that less than 150 years back the population of the district was very meagre, even though the early British official estimate of 100 souls was surely an underestimate, the present data regarding migration are of particular importance. We asked every respondent questions relating to migration. Admittedly, much of the migration has taken place from Nepal, particularly eastern Nepal. But the actual migration took place way back in the past. We see from Table 3 that for the respondents for whom the question of migration is applicable, or who are in a position to recall, 67 per cent have reported that the actual migration to India in their respective families was undertaken by the grandfather or his generation and beyond. In fact, 32 per cent migrations were effected by the great grandfather or his generation and even earlier. Only 2 per cent of our respondents have reported having migrated from Nepal in their own lives: all of them were over 50 years of age at the time of interview.

The picture that emerges is consistent with the history of the region. Amongst the people of Nepali origin who migrated to Darjeeling the tendency to adopt the region of their choice has been noted for a long time. Thus, W W Hunter, in his "Statistical Account of Bengal", noted long ago that "Nepalis who immigrate to Darjeeling from their native country mostly settle down permanently in the district". This is further reinforced by our data relating to the location of the near relatives. 47 per cent of our respondents did not report even one of their relatives living outside the district. Of the 53 per cent (217) respondents who did have even one such relative living outside the district, as many as 88 per cent had their relatives living in other parts of India, and only 10 per cent had any relative living in Nepal. Of these, the majority of the respondents were living in Tharbu TE.

The data relating to exchange of visits with these relatives are of interest (Table 4). There is not a single reported case when only the respondent visited a relative during the reference period of last five years, counted from the date of interview. Out of 198 cases when the relative paid a visit to the respondent, as many as 80 per cent of such visits were not returned; only in 20 per cent cases was there a exchange of visits. This general picture is not particularly different for relatives in Nepal, except for the higher frequency of the respondents visiting their relatives, a fact to be understood in the context of the greater proximity of Tharbu to Nepal.

In sum, with respect to the cultural and social life of the people interviewed by us, it may be said that Nepali is the mother tongue of almost all of them and it is extensively used, inside as well as outside the home. The *jati* identification is generally made in terms of Nepal but, with respect to the *jat*, it is mostly made in terms of caste or tribal names. Considering the data relating to the place of birth and migration together, it may be concluded that the strong regional base of the respondents is established. With respect to the extent of contact with other parts of the country, our data regarding the location of the relatives living outside the district, relations with them and the respondents' travel outside the district indicate an appreciably stronger link with India and a relatively insignificant extent of such contact with Nepal. Here, it may be noted that, no leading or pointed questions were put to the respondents in respect of their contact with Nepal to avoid suspicion amongst them and to ensure unbiased responses.

VI
The Case for Nepali: An Assessment

The findings presented above in no way support the opinion that the Nepalis in this country are "foreigners" or temporary "settlers", an erroneous opinion from which even some of our policy makers are perhaps not entirely free. In this respect, a general confusion of nomenclature is to be avoided: whereas in the Indian context, the term Nepali refers as much to an Indian nationality as, for instance, the terms Kashmiri or Bengali do, in the context of Nepal, it refers to the subjects of the kingdom of Nepal. In this sense, this term is largely comparable with the term Bengali, which refers to an Indian nationality as well as to the citizens of Bangladesh (more recently called Bangladeshi). This classification is important because it touches upon an important point relevant to an assessment of the case for Nepali. One reason against granting costitutional recognition to the Nepali language in India might be that it is the official language of the sovereign state of Nepal. Here, it is good to remember that Bengali has not ceased to be a national language of India with its official adoption in Bangladesh. Besides it should be noted that there are other names by which the Nepali language is known, namely, Gorkhali Khas Kura or Parbatiya.

Yet one more reason against granting Nepali a place in the Eighth Schedule might be the operational problem of extending the Schedule indefinitely. In fact, this appears to be the case when one closely examines the arguments of the former Prime Minister, Indira Gandhi.[36] In her meetings with the delegates of ABNBS, she kept insisting that the demand for the constitutional recognition of Nepali had to be considered with an eye on the possible "repercussions" that the acceptance of the demand might have in other places. Morarji Desai's categorical rejection of the demand on the ground that he did not wish to open the door for scores of tribal languages must also be seen in this light. In itself, the operational problem is a legitimate administrative reason for resisting further expansion of the Eighth Schedule; we must therefore examine whether the case for Nepali is sufficiently strong to deserve a special consideration.

In an important study of the language situation in north India, Brass has perceptively observed that, in recent years, with the recognition that

the regional diversity of the country must be respected by the Central government, four written and unwritten rules have increasingly come to regulate the attitude of the Central government towards demands based on such diversity. One rule, incorporated in the Constitution, is that such demands must stop short of secession. The second rule is that demands based on language and culture will be accommodated, but the demands which are explicitly based on religious differences will not be accepted. The third rule is that such demands will not be conceded "capriciously", that is, a movement must not only have a legitimate case but it must have broad popular support. The fourth rule is that demands by a linguistic group must have some support from other linguistic groups.

Though Brass has formulated these rules with reference to regional demands, especially pertaining to the division of multilingual states, they are applicable to demands stemming from the cultural diversity of the country as well, such as, for instance, the demand for constitutional recognition of a language.

The case for Nepali appears to be strong on all these points. With respect to the last point, the spokesmen of the ABNBS point out that there has not been a single instance of opposition to their demand by other linguistic groups. In fact, references to several newspapers and other writings in Bengali and other languages are made which were written in support of the demand. As a matter of fact, the motion in the West Bengal Legislative Assembly, recommending to the Central government the constitutional recognition of Nepali, was carried unanimously on July 2, 1977.

To turn to the constitutional provisions, the Nepali language fulfils the criteria implicitly assumed in them. First of all, Nepali is a language of India in so far as it is the language of a section of the Indian population and is in use in this country. Besides it is a language which is generally believed to be derived from Sanskrit and belongs to the Indo-Aryan family of languages with a shared cultural past with the other languages of India.[38] Secondly, though the speakers of Nepali are spread all over India, it already has a regional concentration in certain parts of the country, particularly in the hill areas of Darjeeling, Sikkim and Assam. Thirdly, it is one of the "more widespread Indian languages", the actual speakers of the language enumerated in the 1971 Census are more than were enumerated for Sindhi in the 1961 Census, a reference point for the decision in favour of Sindhi taken in 1967.[39] Fourthly, the Nepali language has been recognised as one of the fifteen "literary languages" for the whole of India by a scholar of such eminence as Suniti Kumar Chatterji.[40] More recently, the Sahitya Akademi too has recognised it.

However, we have yet to identify the point in favour of the Nepali language that singles it out as a special case for consideration. As has been pointed out by the Nepali spokesmen themselves several times, it is the "sense of insecurity" amongst the Indian Nepalis that needs to be removed, a feeling which has grown in the absence of a definite language policy. At the root of the demand for inclusion of Nepali in the Eighth Schedule is the following assessment that the leaders of the Indian Nepalis have made — that no government machinery will be, despite its best wishes and efforts, able to effectively implement or enforce for Indian Nepalis the safeguards for minorities preserved in the Constitution, unless Nepali is given constitutional recognition.

This assessment has emerged from generations of experience which have not remained free, at different levels, from the inter-group conflict of interests and prejudices between the plainsmen and the hill people. In fact, such experiences of the hill people go back in the history of Nepal to the fourteenth century, when the high caste plainsmen (presumably from Rajasthan) migrated to Napal and initiated a process of usurpation which has continued unabated to the present day.[41]

It is in this context that the reaction provoked even now in Darjeeling by the observations of Sardar Vallabhbhai Patel may be understood. On November 7, 1950, Patel, then Deputy Prime Minister of India, wrote to Nehru, sharing with him his thoughts on the problem of Tibet and the new situation arising out of "the expansion of China almost up to our gates". "All along the Himalayas in the north and north-east, we have on our side of the frontier a population ethnologically and culturally not different from Tibetans or Mongoloids. The undefined state of the frontier and the existence on our side of a population with its affinities to Tibetans or Chinese have all the elements of potential trouble between China and ourselves .... The people inhabiting these portions have no established loyalty or devotion to India. Even the Darjeeling and Kalimpong areas are not free from pro-Mongoloid prejudices." In the light of this, Patel recommended "enlightened firmness, strength and a clear line of policy" with measures of "internal security" in these areas.[42]

Subsequent history has proved Sardar Patel wrong and not free from his own prejudices; the actual experiences in 1962 in no way confirmed his fears.

There has been, though, a singular absence of any "clear line of policy" with respect to the people living in the border region. For instance, in an interesting study of the Naga question, the writer concludes, "It may be remembered that in the initial stages of the Naga movement, the demand for secession from the Indian Union did not constitute the prime factor; but was taken up later as the Government of India, not trying to understand the sentiment of the Nagas, launched a policy of suppression."[43] Thus, while the Central government has brought itself to a difficult pass with respect to the Nagas due to lack of foresight, it is proving equally ineffective in providing for the further integration of the Indian Nepalis. This is particularly ironical and lamentable in a situation where the Indian Nepalis are themselves clamouring for it. It is the limitation of understanding, the "technocratic" assumption of the policy makers, and inept handling of the situation that have created problems in this region.

Turning to the case for Nepali, the case is for "deep emotional integration" of the Nepali speakers with the mainstream of national life. The crucial question is: what are the Central government leaders prepared to do in order to promote it? The insistent plea of the Indian Nepalis for furthering such integration cannot be any longer neglected. From the national point of view, there are grave possibilities resulting from the continuance

of a policy that does not consider fully the dynamics of actual social processes at work. It is not enough to enumerate all that has been done for the Nepali language — as is the general official practice — for that misses the basic point about the demand of the Indian Nepalis. In short, it is in India's general interest that the Nepali language is granted early recognition and is included in the Eighth Schedule to the Constitution. Such a recognition will strengthen the country's "unity" as well as "security" rather than weaken it. Besides, it is well to remember that any policy decision on this point falls within the internal affairs of the country and it should be independent of any external consideration.

Operationally, the fact that there are at present resolutions from two state legislative assemblies before the Central government, recommending it to recognise the Nepali language, makes the task of the Central government expedient at this point in time.

Notes

[The survey from which we have drawn was conducted during the period of Munshi's association with the Indian Statistical Institute, Calcutta. Further work was done in the course of a research project currently in progress at the Indian Institute of Management, Calcutta, under the sponsorship of its Centre for Management and Development Studies. Grateful acknowledgements are made to the respondents of the survey for their goodwill and co-operation. The managers of the tea estates covered in the survey were helpful and understanding. The office-bearers of the ABNBS, Darjeeling, were kind enough to give information on their activity and also to make available important documents from which this article has drawn. The debts to Kumar Pradhan are too deep to be adequately expressed.]

25 The communication dated New Delhi, September 29, 1977, has been printed in English and is signed by Prem Kumar Allay, General Secretary, ABNBS.

26 This was the last memorandum to Indira Gandhi from the ABNBS. This has also been printed in English.

27 The pamphlet is in Nepali. It also gives information on the composition of the delegation.

28 Reporting on the day, *The Statesman*, Calcutta, noted: "The 5,000 strong procession organised by the Akhil Bharatiya Nepali Bhasha Samiti in Darjeeling yesterday was, according to political observers, a good counter to the Gorkha League sponsored Darjeeling district bandh early this month for including the Nepali language in the Eighth Schedule of the Constitution. The Samiti includes people from the Congress, Janata Party, CPI(M), and its left front partners and the CPI but no one from the Gorkha League, which has been carrying on its own agitations singlehanded."

33 Pamphlet published by the CPI(M) Darjeeling District Committee. It also includes another presentation in the Rajya Sabha by A P Pathak on July 25, 1977.

34 Surendra Munshi and Ugyen Lama, 'The Tamangs of Darjeeling', to appear shortly in the *Journal of the Indian Anthropological Society*.

35 According to the Census of 1971, Happy Valley TE returned 186 households, Ging TE returned 496 households, and there were 963 households enumerated in Tharbu TE. From amongst the existing households, such heads of the households were interviewed as were available and willing to co-operate within the available time. The relatively small coverage from Ging is to be explained by the fact that over 30 filled-in schedules had to be rejected on account of incomplete information. Further, it should be pointed out that since a statistical sample could not be drawn caution should be exercised with respect to any generalisation on the basis of our findings.

36 Reports on these meetings are available in the old issues of *Hamro Bhasha*.

37 Paul R Brass, *op cit.*, pp 16-19.

38 Suniti Kumar Chatterji, *op cit*, p 14.

39 It must be pointed out that the claim made by the leaders of the Indian Nepalis that there are "over five million Indians with Nepali as their mother tongue" appears to be a grossly exaggerated figure. Even if we grant that the Census returns tend to be on the lower side, the discrepancy between the actual number of 1,419,835 Nepali speakers for the country, as enumerated in the 1971 Census, and the claim made by the Indian Nepalis is too big to be justifiable. However, it should be noted that the 1961 Census, recorded, in all, 1,371,932 speakers of Sindhi, including 392,249 Kachchhi speakers.

Continued

Grindlays Bank Limited

PRINCIPAL ACCOUNTING POLICIES

1. **Basis of Accounting** The accompanying financial statements have been prepared in conformity with generally accepted accounting principles and conform with practices within the banking industry.
2. **Specific Provisions for Doubtful Debts** Specific provisions for doubtful debts are made by provisions charged to current revenue. The determination of the balance of the provision is based on evaluation of individual advances, current economic conditions, viability and other factors and reflects an amount which, in management's judgement, is adequate to provide for potential losses.
3. **Depreciation on Investments** Depreciation held represents the excess of the total cost over the total market value of our investment portfolio. The provisions/releases are charged/released to revenue.
4. **Depreciation of Fixed Assets** Depreciation on furniture, vehicles, equipment and properties other than leasehold premises is charged on a straight line basis over the estimated lives of the assets. Leasehold premises are amortised over the periods of the respective leases.

   Equipment is depreciated over a 5 year period.
5. **Premises** Freehold premises and leasehold premises are included at cost or at professional valuation carried out in 1973.
6. **Investments** Quoted securities are stated in aggregate, at the lower of cost or market value. Unquoted securities are included at or below cost.
7. **Advance Payment of Income Tax** Advance payment of income tax and tax deducted at source on investment income, are deducted from provision made for income tax
8. **Confirmed Letters of Credit** Contingent liabilities in respect of letters of credit, are included under "Acceptances, Endorsements and other obligations" on the liabilities side, with a corresponding increase in "Constituents' Liabilities for acceptances, endorsements and other obligations" on the assets side of the balance sheet.
9. **Foreign Currencies** Assets and liabilities in foreign currencies are converted at the rates ruling at the year-end, except that contingent liability in respect of forward exchange contracts is included at the contracted rates.

NOTES

Notes forming part of Accounts for the year ended 31st December 1978

1. **Borrowings** The borrowings from other banking companies, etc. classified as secured are secured by the corresponding advances to customers.
2. **Bonus** (a) Bonus of Rs. 64 lacs has been paid for 1977 (Rs. 67 lacs for 1976 paid in 1977) in accordance with the Payment of Bonus Act, 1965, and has been charged to these accounts. Bonus for 1978, if payable will be charged to revenue on a cash basis, consistent with past practice

   (b) Rs 65 lacs paid in January 1979 in full and final settlement of bonus for 1974 and 1975 will be charged to 1979 accounts on a cash basis
3. **Unremitted Surplus** In terms of current exchange control directives, pending completion of the Bank s Income Tax Assessment for the Accounting Years 1973 to 1978 inclusive, a total amount of Rs. 323 lacs (1977 Rs. 268 lacs), arising from adjustment of Head Office Charges, relating to those years, is held unremitted in India and included in "Deposits and other Accounts."
4. **Income Tax** (a) 1978 Provision

   Provisions for income tax and interest tax estimated at Rs. 1208 lacs (1977 Rs 1342 lacs) have been charged to these accounts and included in the expenditure item "Rent, Taxes, Insurance, Lighting, etc."

   (b) Contingent Liability

   Proceedings were initiated under Sections 147/148 of the Income Tax Act 1961 for the years 1967 to 1970 and writ petitions filed by the Bank in respect of the years 1957 to 1969 have been disposed of by the Calcutta High Court in favour of the Bank. The Income Tax Department has gone on appeal. Further, assessments of some years are in dispute including dispute regarding treatment of interest suspensed on certain doubtful debts. The liabilities, if any, relating to these are not ascertainable at this stage
5. **Staff Retirement Benefits** Retirement benefits to employees retiring after 27th December 1974 are paid from an approved trust fund — Grindlays Bank Limited Indian Staff Pension Scheme. The actuarially valued liability, reduced by the contributions of Rs. 606 lacs already made to the fund (including Rs 100 lacs charged in these accounts to cover annual and part initial contributions), amounts to Rs. 916 lacs on 31st December 1978 (Rs 936 lacs as at 31st December 1977)

   In addition, pension payments to employees who retired on or before 27th December 1974 are treated in the accounts consistently on a cash basis.
6. **Advances** Included in "Debts considered good for which the Banking Company holds no security other than the debtors' personal security" is an amount of Rs. 367 lacs in respect of dues from companies nationalised in 1976 with retrospective effect Claims have been lodged for the above amount together with interest with the appropriate authorities under the Act nationalising those companies. Until these claims have been agreed with the authorities the final amount of the settlement cannot be established. It has, therefore, not been possible to ascertain the shortfall that may arise on the final settlement of these claims and accordingly, no provision has been made in these accounts in respect thereof
7. **Re-arrangement of Previous Year's Figures** Previous year's figures have been re-arranged wherever necessary.

AUDITORS' REPORT

We have audited the Balance Sheet of Indian Branches of Grindlays Bank Limited as at 31st December, 1978, signed by us under reference to this report, and the relative Profit and Loss Account in which have been incorporated the unaudited returns from 18 branches, not visited by us, for which the Company Law Board has granted exemption under Rule 4 of the Companies (Branch Audit Exemption) Rules, 1961 from the provisions of Section 228 of the Companies Act, 1956

Under the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956 the Balance Sheet and Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI of the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms "A" and "B" of the Third Schedule to the Banking Regulation Act 1949.

On the basis of the audit indicated in the first paragraph, we report that

1. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit
2. In our opinion, proper books of account, as required by law, have been kept by the Indian branches of the Bank so far as appears from our examination of those books and the aforesaid unaudited returns and these returns have been found to be adequate for the purpose of our audit.
3. The Balance Sheet and the Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account and the aforesaid returns.
4. In our opinion and to the best of our information and according to the explanations given to us such Balance Sheet and Profit and Loss Account together with the notes thereon give the information required by the Companies Act, 1956 in the manner so required for Banking Companies and on such basis the said Balance Sheet gives, subject to Notes 2 (b), 5 and 6 thereon regarding Bonus Staff Retirement Benefits and Advances respectively, a true and fair view of the state of affairs of the Indian branches of the Bank as at 31st December, 1978 and the Profit and Loss Account gives, subject as aforesaid, a true and fair view of the profit of its Indian branches for the year ended on that date.

The rapid growth of bank credit during the last three months raises some important issues. The first question is how the commercial banks were able to extend credit which was way beyond the limits set by the Reserve Bank. The second and the more important issue is whether the policies and criteria followed currently by the commercial banks in determining the extent of credit for individual borrowers will ever lead to achieving the larger objectives of credit policy such as maintenance of price stability.

AN increasing concern has been expressed by the monetary authorities about the sharp rise in bank credit. The facts are by now very clear. Between December 1, 1978 and March 2, 1979 the aggregate deposits of commercial banks increased by Rs 1,438 crores. During the same period commercial bank credit increased by Rs 1,175 crores. Since there was a reduction in the credit extended for the purpose of food procurement, the increase in non-food credit was of the order of Rs 1,204 crores. The marginal non-food credit-deposit ratio thus works out to 85 per cent, while the Reserve Bank directive issued towards the end of November 1978 required banks to maintain the incremental gross credit (non-food) deposit ratio "well within 40 per cent". While the Reserve Bank has now given additional instructions to the commercial banks to bring down sharply the incremental credit-deposit ratio, [the rapid growth of bank credit during the last three months raises some important issues. The first question that arises is how the commercial banks were able to extend credit which was way beyond the limits set by the Reserve Bank. The second and the more important issue is whether the policies and criteria followed currently by the commercial banks in determining the extent of credit for individual borrowers will ever lead to achieving the larger objectives of credit policy such as maintenance of price level stability].

Credit Expansion

When the Reserve Bank of India sought to control the rapid expansion of bank credit by issuing certain instructions to the commercial banks in November 1978, it drew the attention of the banks to three aspects of the credit situation as it prevailed them. During the period April 1 to November 17, 1978, gross bank credit had expanded by Rs 1,588 crores as against a rise of Rs 345 crores in the same period during the previous year. During the eight weeks preceding November 17, 1978, credit expansion was of the order of Rs 798 crores in contrast to an expansion of Rs 396 crores witnessed during the corresponding period of the previous year. The incremental credit-deposit ratio for the period covering the eight weeks preceding November 17, 1978 was as high as 100 per cent. These were the factors which compelled the Reserve Bank of India to issue instructions to the commercial banks to bring down the incremental credit-deposit ratio sharply. At the same time the statutory liquidity ratio was raised from 33 per cent to 34 per cent. The cash reserve ratios were to be maintained at the previously-increased levels. In spite of the concern expressed by the Reserve Bank of India and the alterations made in the statutory liquidity ratio, the incremental credit-deposit ratio turned out to be twice the limit set by the Reserve Bank of India The average credit-deposit ratio rose from 65.9 per cent as on December 1, 1978 to 66.75 per cent as on March 2, 1979. The steep rise in credit appears inexplicable at first sight. The statutory liquidity ratio was 34 per cent. Banks were required to maintain six per cent of the total demand and time liabilities as balance with the Reserve Bank of India. In addition 10 per cent of the additional demand and time liabilities accruing since January 14, 1977 and a proportion of the increase in non-resident accounts were to be deposited with the Reserve Bank of India. Thus 50 per cent of the incremental deposits was statutorily pre-empted for purposes other than providing credit to the commercial sector. Banks could still provide a much larger proportion of the incremental deposits in the form of bank credit if they had maintained excess cash to start with. In fact, in relation to the statutory liquidity ratio, it was very clearly stated that the higher ratio would be strictly applied to additional deposits regardless of any excess kept as on December 1, 1978. There is no evidence to show that there was excess reserves with banks as on December 1, 1978 to enable banks to provide larger credit by drawing down reserves. In these circumstances, an incremental credit-deposit ratio of more than 50 per cent is possible only if

(a) banks have not maintained the required proportion of the deposits in the form of cash or liquid assets; or

(b) the Reserve Bank has provided the banks with larger refinance facilities, or

(c) banks were able to attract funds through sources which do not attract the statutory requirements.

It appears that all these three factors have operated during this period. On a rough calculation it is seen that the cash maintained by banks as on March 2, 1977 was Rs 96 crores less than what they ought to have maintained. This is based on the data available from the weekly statements on assets and liabilities of the commercial banking system published by the Reserve Bank of India. There could be some other adjustments which could reduce this deficiency. Banks might not have also maintained the statutory liquidity ratio. This must have been so because the Reserve Bank has now come out with penalties to be imposed on banks which have not maintained the statutory liquidity ratio. The very fact that the Reserve Bank has found it necessary to impose such penalties indicates that there must be at least some banks who have not maintained the statutory liquidity ratio. The refinance facilities provided by the Reserve Bank of India have also shown an increase. The outstandings of borrowings of the commercial banks from the Reserve Bank increased from Rs 267 crores on December 1, 1978 to Rs 422 crores as on March 2, 1979 showing a rise of about Rs 155 crores. It has also been reported that banks have been able to raise funds from non-banking financial institutions through the call-loan market and through other devices. The exact amount raised through the sources is not clear. But there has been a sharp rise under the category "other demand and time liabilities". They increased from Rs 824 crores as on December 1, 1978 to Rs 1,206 crores on March 2, 1979. Thus the sharp rise in bank credit

Table : Rates of Growth in Bank Credit, Production and Price Level

(in Per Cent)

Year	Bank Credit*	Non-Food Bank Credit*	Price** Level	Industrial** Production	Agricultural Production
1971-72	12.4	10.1	5.6	3.3	(—) 0.4
1972-73	16.2	17.4	10.0	4.0	(—) 8.0
1973-74	20.9	21.6	20.2	2.2	9.9
1974-75	16.4	15.9	25.2	2.6	(—) 3.2
1975-76	24.2	14.6	(—)1.1	6.0	15.2
1976-77	21.2	17.4	2.1	9.5	(—) 7.2
1977-78	11.7	15.9	5.2	3.9	13.9

* Rates of growth have been calculated from the outstanding figures as of last Friday of March.

has been facilitated partly by the Reserve Bank's inability to monitor the events as they were happening and partly by the ingenuity of the banks in raising resources which do not attract statutory restrictions.

One question that arises in this context is whether the Reserve Bank of India was justified in prescribing an incremental credit-deposit ratio of 40 per cent The prescription of a ratio does not necessarily indicate the desired extent of the increase in bank credit in absolute amount. Perhaps an incremental credit-deposit ratio of 40 per cent could have been complied with by the commercial banks if the rise in deposits had been of a much higher order In deciding on the desired incremental credit-deposit ratio, the Reserve Bank must have estimated the possible increase in deposits and the desired increase in bank credit. As mentioned previously, the Reserve Bank had noted that between April 1 and November 17, 1978, the gross bank credit expansion in absolute amount was three times the amount extended during the corresponding period in the previous year. Between December 2, 1977 and March 4, 1978, the expansion in bank credit was of the order of Rs 588 crores as compared with an increase of Rs 1,175 crores during the current season. If incremental credit-deposit ratio had been maintained at 40 per cent, bank credit expansion in absolute amount would have been the same as that during the corresponding period of the last season. In fact this leads us to examine the next issue, namely, whether there is a known relationship between production and credit and whether the present systems of lending followed by commercial banks can result in maintaining such a relationship.

Credit Production

Monetary and credit policy in this country has always emphasised the need to regulate the total volume of money and credit in accordance with the requirements of production. The letter addressed to the Chairmen of all the banks by the Governor of Reserve Bank of India in November says: "Credit has to be necessarily related to increase in output, economic activity, employment creation and so on." Reference is also made in the same letter to the high rates of money supply expansion in the past two consecutive years. The circular goes on to add: "The stability of wholesale price so far should not lull us into a sense of complacency. We should not lose sight of the inherent dangers of a sizeable build up of potential demand, reflected in the money supply expansion of the last two-and-a-half years." Thus credit policy at the national level is concerned with maintaining price stability and promoting production.

In the Table we have shown the rates of growth in bank credit, non-food bank credit, industrial production, agricultural production and the wholesale price level for the seven years beginning 1971-72. From this Table it is hard to see any correlation between the expansion in credit and the other variables. It must also be noted that these are the years in which the credit control measures have been used to the maximum. The Table only indicates that the relationship between credit and production is complicated. Causation does not run in one direction and it becomes therefore difficult to regulate credit assuming that production grows or can grow at a particular rate. There are also some economists who claim that there is no direct relationship between the manner in which an increase in money supply is brought about and price level and production. They draw attention to the fact that the income velocity of circulation in most countries varies between three and four. While the sources of monetary expansion may produce certain initial impact, the subsequent effects are independent of the factors responsible for the initial increase in money stock. This is an extreme position to take. This represents what is very often referred to as the "money view". As against this, the "credit view" emphasises the sources of monetary expansion and their impact on the economy. The implications of the two different views need very careful examination in the Indian context.

There is, however, no doubt that there must be a link between credit and production. In this context, it is pertinent to ask whether the present systems of lending adopted by the commercial banks will ever achieve this. While the concern of the monetary policy is to regulate the volume of credit in relation to (physical) production, at the micro level of the banks, there is no such direct link between credit and physical production. Much has been said and written in recent years about the Tandon Committee norms. These norms are designed to impose a certain amount of discipline on the borrowing units with regard to the stocks they maintain. But the link between production and credit is indirect. While the committee itself emphasised the need to look at the borrowers' total operation and not merely the inventories and receivables, the operational details relating to the determination of the quantum of bank credit have somewhat clouded this. Operating statements and the fund flow statements supplied to the banks help only to make some general judgments about the borrower. Ultimately the estimated current assets and current liabilities determine the working capital gap and the proportion to be met by the banks. Thus if the prices of input and output increase, there is really no check under this method on the credit granted. Even though the norms are prescribed in terms of months consumption of raw materials and months production of finished goods, they are ultimately to be translated in value terms and therefore an increase in the prices of input and output will also result in larger volume of bank credit being granted The Tandon Committee norms can play only a limited role in ensuring that bank credit moves in some close relationship to production in physical terms. Unless a system is instituted under which the credit granted is related to the physical increase in output and data collected periodically on that, the role of maintaining a relationship between bank credit and

physical production cannot be achieved. Under such circumstances, it is not meaningful to talk in terms of aggregate credit moving in step with the rate of growth in industrial production or agricultural production. Much less can one talk about regulating the level of credit in order to maintain price stability. If the broader objectives of credit policy such as price level stability and promoting physical production are to be achieved, the present lending system at the micro level will have to be altered. In fact, what is in operation currently is the good old real bills doctrine. It is not our intention to argue that the rate of bank credit growth should be the same as the rate of growth in industrial production or net national product or any other given variable. As mentioned earlier, the relationship among them needs much closer investigation. However, so long as the criteria for lending adopted by the banks do not incorporate an assessment of the increase in physical production, it will be difficult to regulate the total level of credit according to the growth rates in production.

The purpose of this note is not to provide a complete framework for analysing credit policy. However, recent credit trends quite clearly indicate that there is a hiatus between the objectives and considerations that influence policy-makers in determining the overall credit level and the factors that influence the operating units in providing credit. To try to take care of this situation by a 'policy of 'stop and go' may produce an adverse effect on production itself. What is, therefore, needed is a change in the criteria used by banks for providing credit to individual borrowers. They must be made to fall in line with the overall considerations so that the objectives of credit policy can be achieved continuously.

Cynamid India

CYNAMID INDIA's two major shareholders, American Cynamid and Atul Products, are offering for sale 6,83,924 equity shares of Rs 10 each at a premium of Rs 12 per share to comply with one of the conditions imposed by government while approving its licence for manufacture of a variety of organophosphates for agricultural inputs. The project cost, estimated at Rs 2 crores, is to be financed from self-generated funds. The company also planned another project in fine chemicals field which is estimated to involve a capital outlay of Rs lakhs. The finance for this will also come from internal resources. The company was incorporated in India in September 1947 under the name Lederle Laboratories (India) as wholly-owned subsidiary of American Cynamid to manufacture speciality drug products. The formulation plant was commissioned in 1953, and an antibiotic fermentation plant was established in 1961. In 1962, the company put up a plant for manufacture of malathion insecticide. Its name was changed to the present one. Over the years, the company has acquired reputation as a major pharmaceutical and agricultural chemicals unit. It has shown excellent working results, with turnover rising from Rs 14.98 crores in the year ended November 1974 to Rs 18.25 crores in 1977-78 and profit after tax from Rs 1.28 crores to Rs 1.75 crores in the same period. Total issued share capital is now Rs 4.56 crores, and is backed by reserves of Rs 4.74 crores. The issue is expected to be made some time in May 1979.

THE government, more precisely the Minister of Industry, has been exercised for the last many weeks over the rise in prices of cloth. At a meeting with representatives of the Indian Cotton Mills Federation (ICMF) on March 16, George Fernandes called upon millowners to immediately come forward with concrete proposals to bring down prices of yarn and cloth. Thereafter a series of meetings are said to have been held between representatives of the Industry Minister and the ICMF. On April 11 the minister told the Lok Sabha that if the textile millowners did not reduce prices to a reasonable level, the government would take steps to compel them to do so.

But for all the apparent determination and firmness of the Industry Minister, the recent exchanges between the government and the textile industry are a typical example of the government acting without a coherent policy, without clear objectives and without instruments which can plausibly achieve the desired results. It was only some nine months ago, in August last year, that the Industry Minister had announced a so-called integrated textile policy under which he had gratuitously absolved the private sector textile mills of the obligation to produce cloth of mass consumption at controlled prices. Instead a 10 per cent surcharge on excise duty was levied on the textile industry for the express purpose of recouping the losses on production of such cloth, the responsibility for producing which was given over to the public sector textile mills of the National Textile Corporation (NTC). The private sector textile industry correctly interpreted the new policy to mean that once it paid the excise surcharge, it would be free to produce what the market demanded and to price its products according to what the market could bear. This is precisely what it has done.

There has been a marked rise in demand for textiles in the last one year or so. The textile industry has responded to this situation in an entirely predictable manner — by raising prices and by changing the pattern of production further in favour of the high-priced varieties of cloth. As a result, while there has been only a small increase in production in terms of the quantity of cloth — only about 1 per cent between April and October 1978, according to the Annual Report of the Ministry of Industry — there has been a sharp rise in the value of output The rise in the earnings of textile mills has been even more impressive, since there has been a sharp fall in prices of cotton and supplies of imported synthetic fibres have been plentiful. Significantly, the behaviour of the public sector mills of the NTC has been in no way different from that of their private sector counterparts. They have fully shared in the increase in cloth prices and, to the extent the state of their equipment permits them, have increased the production of higher-priced varieties at the expense of cheaper cloth. Also, though the Minister of Industry has been tight-lipped on the subject, the NTC mills are being paid a substantially higher price for their output of so-called controlled cloth — just around 83 mn metres in the quarter October-December 1978 — than the private sector mills were permitted to charge when they were supposed to be producing such cloth. Contrary to the claims of the minister, it is these factors, much more than "better management", which are responsible for the likelihood that the NTC may earn a profit of Rs 3 crores in 1978-79, compared to losses of Rs 65 crores in 1976-77 and Rs 35 crores in 1977-78.

Against this background what sense does the demand for a 10 per cent reduction in textile prices, which the Minister of Industry has been harping upon, make? For one thing, reduction over what level, it may be asked. Prices of many cloth varieties have been raised by mills even after the start of negotiations between the government and industry aimed at achieving a reduction in prices. Further, given the very large number of cloth varieties, the government quite simply does not have the administrative machinery to ensure that a formal agreement to reduce prices at the level of the ICMF is in fact implemented by all the mills and in respect of all the varieties or that such an agreement is not made nonsense of through the mills introducing supposedly new varieties as has been done in the past whenever government has tried to keep prices under check by prescribing stamping of prices on cloth. More important, of which kind of cloth does the government want prices to be reduced? Does it serve any purpose to marginally lower the prices of cloth varieties which, even at the reduced prices, can be bought only by the relatively rich? On the other hand, if the government does manage to get the prices of the cheaper varieties reduced, how will it ensure that the mills do not shift from these to the higher-priced varieties? Finally, even if the government manages to ensure production of a certain quantity of the cheaper varieties of cloth at more or less the prices determined by it — a most unlikely eventuality — it

will only mean getting back to some sort of a controlled cloth scheme, which the government had in its wisdom decided to abandon less than a year ago and which, in any case, cannot succeed without an effective distribution system, of which there are still no signs. In this context, it is also curious that the Minister of Industry, apart from making cursory references, has not shown any special anxiety over the rise in prices of cotton yarn. Given the fall in cotton prices, the rise in yarn prices is very much more indefensible than that in cloth prices, since the cost of cotton, which is believed to constitute 40 per cent of the cost of cloth, forms a very much larger proportion of the cost of yarn. More important, the price of cotton yarn largely determines the cost of cloth produced by the handloom and powerloom sectors of the textile industry. According to last year's so-called integrated textile policy, the handloom sector is supposed to produce the bulk of cheap cloth required by the poor. And yet the Minister of Industry does not seem to be particularly bothered about the steep rise in yarn prices.

All these contradictions and confusions in the government's current concern about cloth prices arise because of the absence of a coherent policy. Cloth is a basic necessity of life and the central objective of the government's policy in regard to the textile industry ought to be to ensure that more and more cloth of the type demanded by the poorer sections of the population is produced at prices which they can afford to pay. In fact, however, the product pattern of the textile industry has been changing rapidly in favour of sophisticated, high-priced cloth varieties. Of late, this trend has been actively encouraged by the government's modernisation programme financed by soft loans at subsidised rates of interest from the public financial institutions. In this respect the motivations and performance of the public sector mills of the NTC have been no different. Even the better organised section of the handloom sector — the section which is the recipient of the lion's share of government assistance in various forms such as institutional finance and subsidies — has been moving over to production for export or for catering to the requirements of the urban well-off through sophisticated sales emporia in the metropolitan cities and the larger towns. With the textile policy thus in a shambles in the most essential respects, the current haggling over prices is another instance of playing to the gallery by the Minister of Industry.

India-Bangladesh Relations

Significant Silences

THE joint communique issued at the end of the Prime Minister's visit to Bangladesh includes all the expected lofty sentiments about fruitful and constructive co-operation between the two countries. But on the specific and very material problems that exist between the two countries, the communique is not much more than a series of affirmations of good intentions.

Even in the euphoria following the dismemberment of Pakistan, the leadership in Bangladesh did not lose sight of many of the virtually 'permanent' disputes that had remained unresolved between India and East Pakistan. Since then, both the previous and present administrations in Delhi and Dacca have kept on talking round and round the subject, with a lot of goodwill oozing, but with little actual progress towards the resolution of outstanding contentious issues.

It is not difficult to identify what these issues are. The most important of these is the dispute over river waters, and progress towards the resolution of this dispute has been hampered by India's curious insistence that Bangladesh should not 'internationalise' the dispute — curious because the very fact that India and Bangladesh are discussing the issue means that the issue is already internationalised. There is no reason why India should object to involving Nepal and China in a comprehensive agreement covering the waters of the Ganga, the Teesta and the Brahmaputra since, hydrographically, both Nepal and China are part of the Ganga-Teesta-Brahmaputra basin. The other major problem, involving the demarcation of the maritime boundary between the two countries, has been made more complicated because of the suspected off-shore oil reserves in the Bay of Bengal. Ideally, India and Bangladesh should be able to agree on joint exploration for oil in the Bay; but that would be possible only if the basic political relationship between the two countries was one of equality in fact, and not merely in words.

But the most pressing and immediate problem between the countries affecting lakhs of people in their daily lives does not even merit a mention in the communique, though the Extrenal Affairs Minister has assured that the issue was discussed 'threadbare'. There are three aspects to the problem: one, ensuring that the non-Muslim minorities in Bangladesh would be as 'safe' as minorities in any of the underdeveloped countries can be, given the fact that their actual vulnerability is further intensified by various pressures to which the 'majority' community too is subject; two, the problem of the so-called 'infiltrators', especially into Assam and other regions in the northeast, a problem which had loomed large for years before Pakistan was dismembered but was officially considered to have disappeared during the Mujib regime, but which since then is once again becoming the Number One issue in Assam and other regions of the northeast; and finally, the overt and covert support extended to insurgent elements of various hues by the governments of both the countries, for their own reasons.

These are problems which can never be solved by governments which, for all their professions, do not really want to tackle them since they always provide a good excuse to mobilise 'mass support' for one or another variety of chauvinism. For instance, the immigration of Muslim peasantry into Assam has been going on since the days before Independence, organised by the then rulers and their native collaborators as an economic necessity and a profit-making enterprise. That 'lure' of Assam as the land of plenty and opportunity — whatever be the harsh reality — continues to grip many poor people not merely in Bangladesh but in regions further westwards and even southwards. But naturally, the influx from Bangladesh is considered more 'sensitive', though this cannot have continued without some organisation involving local agents who are for the most part leading supporters of the ruling party and the local political leadership. The 'infiltrator' is necessary not merely to labour hard in the jute and paddy fields and to swell the 'block votes' that the ruling party has always been able to command at every election in Assam; he is also nesessary to serve as a permanent 'security threat' — a focal point for mobilising local chauvinisms

The communique is also silent about what exactly was said in the discussions on the problem of insurgency. The Prime Minister has claimed in Parliament on his return from Dacca that Bangladesh had assured him that it would not give any assistance to the Mizo National Front; and the External Affairs Minister has disclosed that a similar assurance was given by India

that it would likewise take measures to prevent Bangladesh rebels from mis-using its territory. What this actually means is that while the two governments will continue to bicker and deliberately let some of the disputes linger, they are united on the question of combining to crush any real challenge that might be presented to the systems they head, be it from groups affirming old-fashioned sub-regional nationalistic feelings or from more radical formations. But the fact that such co-operation is not formally acknowledged also means that both the governments have retained the option to be fairly selective in their perceptions of what constitutes insurgency, which kind of insurgencies in each other's territories should be suppressed with a firm hand, and which kind of insurgencies should be nursed and encouraged with a view to securing further concessions in the more widely known disputes between the two countries.

Industrial Relations

RAW Takes a Hand

OFFICIALLY, the Research and Analysis Wing of the Union government (RAW) is supposed to be engaged only in 'research and analysis' activities, a transparent euphemism for its role as an intelligence gathering agency, active in foreign countries, with its domestic role being confined to gathering such intelligence from areas along India's borders with neighbouring countries. But perhaps for the first time, it has been revealed by no less a person than the chairman-cum-managing director of Bharat Coking Coal Limited (BCCL) himself that the agency has been active in areas where it has no business to be — studying the labour situation in the collieries in and around Dhanbad.

Of course, that RAW has been active very much in the country's internal political situation has been widely known, and much of the achievement of the Central government in securing the mutual destruction of communist parties and groups in West Bengal immediately after the overthrow of the second united front government has been credibly attributed to the exertions of RAW and its agents.

What however gives the news an added significance is that this 'study' of the industrial relations in the Dhanbad coal-belt was undertaken following what the BCCL boss has described as "organised and planned attacks with the blessing of some political leaders" on some of the officers of the BCCL. In case there is any ambiguity about who these "political leaders" are, the report goes on to identify them: "The alleged assailants are stated to be supporters of a Member of Parliament belonging to the Marxist Co-ordination Committee". The reference is clearly to the Colliery Kamgar Majdoor Samity, a union which according to all reports seems to be one of the very few in Dhanbad which has refused to be incorporated into the management-contractor-union nexus whose murky doings in the Dhanbad coalbelt have been highlighted in many recent reports from the region. It is not at all surprising, therefore, that RAW's accusing finger should point at Samity.

Janata Party

'Continuing Crisis'

THE present phase of the 'continuing crisis' in the Janata party, about which the party president has been speaking with increasingly less convincing self-assurance, began with the reinduction of Charan Singh into the Union cabinet. The leaders of the Jana Sangh component of the party have been making much of the fact that Charan Singh, who after all returned to the cabinet because of the pressure brought upon Morarji Desai by Jana Sangh leaders, has ungratefully incited known and freshly acquired cronies of his to launch their hypocritical attacks on the links of the former Jana Sangh leaders with the RSS. According to this version, the Jana Sangh had no option but to retaliate in Bihar for what Charan Singh did to them in UP. Very magnanimous in its victory, the Jana Sangh leaders are reported to have advised their chief ministers who are heading the administration in Rajasthan and Madhya Pradesh not to drop BLD ministers from their governments.

This posture of injured innocence and of loyalty being repaid by rank ingratitude is less than convincing. The most notable feature of the role of the Jana Sangh during the long months when Charan Singh was sulking was the dexterous way in which the leaders of the party kept up the impression of being in favour of Charan Singh's reinduction into the cabinet, but at the same time made it clear that their commitment to Morarji Desai's leadership was not negotiable. Sections of the Jana Sangh leadership also took, perhaps not unintentionally, seemingly contradictory stands on the question of Charan Singh, no doubt part of their long-term policy of covering all possibilities and keeping the option of a future accommodation open with every adversary. Charan Singh is himself too shrewd an operator not to have seen through this ambidextrousness, and no sooner did he return to the cabinet than he attempted to cut the Jana Sangh component to size.

It would however be an oversimplification to say that this 'continuing crisis' is merely a manifestation of the party's inexorable death-wish. On the contrary, what is taking place is a carefully measured series of attacks and counterattacks by what after all are the two major (and, in the final analysis, the only relevant) constituents of the Janata party, with a view to testing each other's strength and nerves — all part of the process of capturing the party organisation and being placed in an advantageous position to fight the general elections in 1982. The struggle is going on not merely in the state ministries, but also in the organisation where the dispute whether the organisational elections which are at present in varying stages of completion should be completed, or suspended, or entirely scrapped, with the Jana Sangh component (more efficient in enrolling its supporters as members) urging that the process be completed and Charan Singh and his supporters (way behind Jana Sangh in this respect) calling for their total scrapping.

Even if the present crisis blows over, like innumerable crises before now, a new dimension has been given to the correlation of forces inside the Janata by the unusually open and forthright stand taken by the Jana Sangh component of the party on the question of its association with the RSS. Unlike on earlier occasions when the top leaders preferred to underplay their RSS connections, in the present instance, notice has been served on the rest of the leadership that the Jana Sangh would not repudiate its RSS links and would even be ready to leave the party. The other side of such forthrightness has been the disapproval of this 'timid and defensive' stand of Atal Behari Vajpayee by a large number of Jana Sangh/Janata MPs who have maintained that the Jana Sangh leadership, far from saying that it would be ready to 'leave' the party, should make it plain that the party is their creation; that if anyone should be forced to 'leave' the party, it should be the calumniators of the Jana Sangh. And consistent with this stand, more than one formal move has been initiated by leading members of the Jana Sangh to secure the expulsion of Raj Narain,

the most vocal critic of the RSS, from the party.

The present development in the Janata — as well as in both wings of the Congress which too have been passing through a crisis of sorts — have given rise to renewed speculations of a 'realignment' in Indian politics and the possibility of the emergence of a 'third force'. At least some leaders in the Janata and both the Congresses must be having visions of forging such a 'third force' excluding the Jana Sangh, Indira Gandhi and Charan Singh and their cronies. The ideological moorings for such a formation are anyway readily available in the CPI's formulations on the role of the national bourgeoisie, though the CPI itself is in no position to extend to it anything more than verbal support.

But it is doubtful if such a formation, assuming that it can take shape, can actually work. Given the state of politicisation of the masses and the long-existing political alliances, any political formation which seeks to exclude Congress(I), Jana Sangh and the BLD can be no more than a party of leaders, since its support would not comprise even a rump of the bourgeoisie.

Pakistan

'Constitutional Role' for Army

THE decision of the six-party Pakistan National Alliance (PNA) to withdraw its representatives from the nine-month old military-cum-civilian government headed by Zia-ul-Haq on the ground that the alliance had achieved its objective is not unexpected. The PNA has naturally cared to spell only two of these "objectives" that it says have been fulfilled; the announcement of a firm date for elections; and the announcement on the formal enforcement of Shariat laws to usher in the promised Islamic order in Pakistan. Equally naturally, it has not added that this decision was influenced by yet another 'objective' of the PNA being achieved — the elimination of Zulfikar Ali Bhutto.

Even the acknowledged 'reasons' adduced by the truncated PNA for quitting the government (the decision was announced on April 14, ten days after Bhutto was hanged) are not very convincing. The decision to enforce Shariat laws was taken on February 10, on the occasion of the birthday of Mohammed, four days after the Pakistan Supreme Court dismissed the appeal by Bhutto against the death sentence awarded to him by the Lahore High Court; and the firm date for elections were announced on March 23 (Pakistan Day), the day before Bhutto's petition for a review of the Supreme Court sentence was dismissed. The PNA had all the time in the world to quit the alliance, had this decision been influenced only by the fulfilment of the stated 'objectives' and none else.

But it is not at all certain that elections scheduled now for November will actually be held even if 'extra-constitutional' developments do not overtake events. It is even less certain that they will be held in accordance wih the existing provisions of the constitution about which Zia-ul-Haq has been expressing his reservations very freely. On September 1, 1977 two days before the arrest of Bhutto in the Kasuri murder case, Zia-ul-Haq was maintaining that while his 'interim government' proposed no Constitutional changes, he himself was of the view that "the *Presidential* form of government was most suitable for Pakistan as it was very close to the Islamic concept of 'Amir' ". He was also of the opinion that the Armed Forces should have a "constitutional role" to enable them to act in critical conditions to ensure stability and integrity of the country. "The country's integrity had to be ensured and only the armed forces and not the politicians could ensure it."

In the latest announcement of the election programme, while reiterating that 'basic issues' (the Islamic ideology of Pakistan, the federal parliamentary system of government, and provincial autonomy) unanimously agreed upon and enshrined in the 1973 constitution would not be reopened, there is no mention of whether another unanimously agreed constitutional provision — that of universal adult franchise — would be in for some kind of challenge. What is however more interesting is that once again, Zia has raised the question of the powers of 'President and the Prime Minister, and has now promised to amend the Constitution before the scheduled elections in order to "strike a balance between the powers of the President and the Prime Minister". He has also reiterated that the armed forces were the only institution which was stable and which could ensure the security and integrity of Pakistan.

The announcement of the judgment by the Lahore High Court was followed by a most significant interview that Zia-ul-Haq gave to Teheran's *Keyhan International* in which he reiterated the points he had made immediately before Bhutto's arrest and also spoke at length on the process of 'accountability' That interview also throws a flood of light on the thinking of the man who appears, at least for the present, set to rule Pakistan for a long time. Zia apparently believes that the creating of "a tremendous polarisation — polarisation between the right and the left, the poor and the rich, among the students and the labour, and between the haves and the have-nots", was the "intentional doing of the former government".

Q: There are rumours in and outside Pakistan that yours is a rightist regime and you intend

to suppress the leftists before holding elections. Would you comment on this?

A: I have no dispute on this. I am a rightist.

Q: How would you go about suppressing the leftists? This has created fears among the leftists — for example, the former NAP.

A: Well, the sooner the leftists wake up and come on the middle of the road, the better it would be for them because I have not started tightening my grip. We have no place for too many of extremists, we follow the middle of the road.

Q: There are different types of leftists: extremists, moderates, etc.

A: There is nothing much to choose between the leftists. I can tell you this.

Hard times ahead for the people of Pakistan.

LETTERS TO EDITOR

Economic and Demographic Development

I STARTED reading Asok Mitra's article "Integrated Strategies for Economic and Demographic Development" (February 3-10, 1979) with great enthusiasm but ended with great disappointment. I expected a much more penetrating analysis embracing the question of population pressure necessitating appropriate land reforms and agrarian organisation as the basic force to generate indigenous technology leading to industrial development.

History has it that the success of land reforms and agrarian reorganisation measures to solve the problem of pressure of population on existing resources depends on how they stimulate the development of indigenous technology that effectively utilises available factor endowments of a country and thereby leads to the industrial development. This is the fundamental criterion of the integrated strategy for economic and demographic development. In such a strategy, the rate of population growth is not the issue because it tends to decline with the development of indigenous technology.

The issue at hand is the creation of increasing and productive demand for labour which can only be created in an economy like that of India by reorganising the economic structure to generate an indigenous technology for the entire economy. The growth of an indigenous technology at the initial stage, based on resources released from land reorganisation would need all the labour it can get hold of. Thus the supply of labour after the land reform measures are adopted may even prove to be inadequate compared to the demand for generating suitable technology.

The existence and the vigorous operation of an industrial sector based on imported capital and technology would frustrate the development role of any form of attempt towards land reforms and agrarian reorganisation to stimulate indigenous technology suitable to the factor supply situation of the 'surplus labour' economies. We cannot formulate an appropriate land reform and land reorganisation policy that can take care of improved technology, reducing unemployment, increased productivity when the industrial sector is a parasitic sector not rooted in the indigenous economy. (The parasitic character of our industrial sector can be easily understood from the dependence of nearly 80 per cent of the population on agriculture.)

When the pressure of population growth calls for improvement in technology so that available labour could be used more productively to increase the output to meet the needs of growing population, the first step to achieve it is to bring about the appropriate changes in land tenures and agrarian organisation from the prevailing small scale to large scale holdings using surpluses. These surpluses are released through such reforms which, in turn, at the next stage, force development of indigenous technology and thereby stimulate the pattern of integrated industrial and agricultural development.

Asok Mitra is silent about what should be the relationship of integrated agricultural and demographic development with industrial development. May we assume then that industrial development would be mainly based on foreign so-called efficient capital and technology? Should industrial development be left outside his schema for the integrated strategies? It is well known today that borrowed technology does not help in the development of the indigenous technology of the Third World countries. Borrowed technology may be most productive but it is most inefficient in our economy in the sense that it cannot use efficiently the most available factor of production. A technology is considered efficient only when it can use effectively available factors. Borrowed technology cannot do it simply because the factor endowment situations of borrowers and lenders are just the opposite of each other due to historical forces that have been at play in the growth of these two sets of countries since the beginning of the so-called modern development period. N Rosenberg's observation in this connection is worth reproducing: "one must give up the notion that it is possible to analyse the effects of technological change independently of its context, since the same technology will have very different consequences in societies whose institutions, resource endowments and histories differ" ("Perspective on Technology", CUP, 1976, p 2).

Alternatively, if we think that borrowed technology can help the development of indigenous technologies of the Third World countries, then to talk about land reforms and agrarian reorganisation policy is superfluous. In other words, Asok Mitra's integrated strategies for economic and demographic development with industrialisation based on foreign capital and technology is self-contradictory.

Permanent Settlement in Champaran

I HAVE read the letter by Girish Mishra and the reply by N Benjamin ("Permanent Settlement in Champaran", March 10). Mishra is perfectly right on the question of land rental. Let me illustrate. Suppose land rental was Rs 11,000 and the governmental demand was fixed at 10/11. In this case the zamindar's *profit* would be Rs 1,000. Mishra says in his letter that zamindar's profit is 1/10 *of the government revenue*. It means that it is 1/11 of total rental. Arithmetically if the rental is x, then the government revenue is $x \times \frac{10}{11} = \frac{10x}{11}$. Zamindar's share $\times \frac{x}{11}$. $\frac{10x}{11} + \frac{x}{11} = x$. Zamindar's share is 1/10 of the government revenue, i e $\frac{10x}{11} \times \frac{1}{10} = \frac{x}{11}$ or $\frac{1}{11}$ of x.

A Spreading Paralysis

Romesh Thapar

WHILE our politicians debate all manner of irrelevancies, and the press dutifully reflects this irrelevance, the people are beginning to show considerable disquiet about the current situation. Despite the "performance" of the economy, there is now enough evidence to suggest that non-governance cannot continue for long. An economic destabilisation is on the way judging trends as they are developing, and despite optimistic statistics.

The absurd claims of the Finance Ministry that the Budget would have only a marginal effect on prices are already in tatters. Prices have begun moving up over a wide range of commodities. If subsidised essentials are still available at old prices or nearabouts, it is pretty certain that the general rise will begin to influence the market. The extraordinary rise in transport costs, following the petrol and diesel levies, and the runaway situation in building materials, both in urban and rural areas, cannot but prove inflationary.

Parallel to this situation, the Central and state governments have been indulging in a dangerous populism where irresponsible trade unionism is concerned, particularly in sectors where there is TU competition (read: party racketeering!) for what is called "leadership" and "recognition". The earlier violence in various industrial belts, has reached the dimensions of mafia gangsterism in sensitive areas like the coal fields. No political leader or party has shown an inclination to take a stand on the responsibilities that free unionism imposes.

The worst aspect of this growing chaos was highlighed when Prime Minister Morarji Desai pulled up the Railway Minister Madhu Dandavate for his ineffectiveness in curbing the "wild cat-strikes" which have wrecked the organised movement of goods over the sub-continent. Dandavate, playing it soft, argued that ring-leaders were being "suspended" (whatever that may mean today!), but Desai demanded "dismissal" and the use of army help. The politicians begin to tremble when confronted by these realities and the old men are abused for their impatience because they will not be around in 1982.

Whatever the calculations of our populist politicians, who think only of their damnable votes but never of the country's health, the report from West Bengal of a total power failure (still described as "shedding"!) should send shivers through the system. Mismanagement of a gross nature, and political in-fighting among lefties of various description, have grievously ravaged power stations put up at enormous cost (one-fourth of capacity is idle all over India!). Now millions will be on a forced holiday — and, naturally, full pay will be demanded at paralysed factories!

All the tall talk about increasing production and maintaining the price line is beginning to make little sense to producer and consumer when the energy situation in the country has entered the disaster scenario. Electric undertakings have become the happy recruiting area for the nominees of the manipulator politicians. Visiting experts are horrified at the state to which the power plants have been reduced. And there is little intelligent effort to halt the slide downwards. The shadow of Bengal is creeping over large parts of the country.

If such dislocations and disruptions were the exception rather than the rule, there would be less cause for worry, but the *malaise* is general, from shameless copying at examinations in many university centres to indiscipline among executives holding key positions in the administration of the economy. And the really ugly aspect is the reluctance to state these truths, or the attempt to cover them up in all manner of double-talk and double-think. Only some aged figures in public life take positions, but without stressing the need to reform our decrepit systems and structures.

From Janata party tangles, to Islamic killings, to Billa and Ranga, to the Moynihan revelations about Indira Gandhi and the CIA — all these diversions reduce the focusing power of our politicians to such an extent that only Bhave's cow protection gambit, or prohibition, excites interest. Talking of prohibition, the government has now so reduced the outlets for the sale of liquour in Delhi that mile-long queues take up position to grab the supplies and to blackmarket them. This goes on in Morarji Desai's backyard, but he is none the wiser — or, maybe, this is his plan.

And nobody in the governmental establishment really moves to correct these aberrations. As citizens we are expected to adjust to the new order of things. If everyone in the system considers that "over and above" earning (or corruption as we used to call it!) is justifiable when salaries are low or unrealistic, the citizen is persuaded that there is no way of surviving without succumbing to the new culture. A black-money state is again taking shape with all its explosive political content But who cares? Certainly not the old men at the helm of affairs. They will not be around to cope with the explosion!

All the efforts to organise interventions in public affairs by committees of various sort have failed. Even Jaya Prakash Narayan's vigilance committees are remarkable for their inability to stir. And, yet, with political parties drugged by populist postures, the only hope is to spark protests by active citizens and to demand actions which can salvage the situation and restore hope to the people. In limited areas, these actions, with the support of the press, have yielded results. A wider assault on so many of our nihilistic administrative and economic practices has not developed.

Ah, yes, unlike our neighbours, we have kept clear of religious fanaticism Witness our political perambulations around the Jan Sangh/RSS. Prime Minister Desai, however, doesn't see the incongruity of declaring (or reassuring his critics) that government servants cannot join the RSS, forgetting that the Cabinet iself has RSS activists! Or is he denying cultural status of this secret organisation? If so, he's creating another crisis within the Janata formation. Or is he not? And so we go on in the Capital these days thankful that we have not paralysed like Calcutta ... *April 14.*

Diversification with Profit

Hamsavirdh

CENTURY SPINNING AND MANUFACTURING is expanding its business. It has applied for an industrial licence to establish another cement plant with an annual capacity of one million tonnes at Manikgarh in Chandrapur district of Maharashtra. Meanwhile, its Maihar cement project is expected to commence production before the end of this year. The delivery schedule has been delayed in respect of a substantial part of machinery and equipment due to labour problems in some of the major suppliers' factories. The company has been issued a 'letter of intent' for expansion of capacity of the existing Tilda plant, from 6 lakh tonnes to 8 lakh tonnes per annum. This plant has achieved 113 per cent of capacity utilisation during 1978 as against the industry's utilisation of 89 per cent, and won commendation from the Cement Controller. The company has revived its pulp and paper project. It has a 'letter of intent' for manufacture of 20,000 tonnes, each, of rayon grade pulp, writing and printing paper, and newsprint. The management has decided to implement the first two schemes at the earliest. These two schemes would involve a total captial outlay of Rs 45 crores. Matters regarding land, forest lease and power supply are being pursued with the UP government. Important orders for machinery have already been placed. The pulp plant is expected to go on stream during the latter part of 1981 and the paper plant in about three years' time. The company's joint venture of palm oil project in Malaysia went into production in October 1978. Full production in all three divisions is expected to be achieved shortly. The Malaysian company's products are being exported to the US, Europe, Japan, Middle East, India, etc. The future of Century Electronics, however, is still uncertain. It has been refused permission to sell modules and watches manufactured by it in the domestic tariff area. Recently, however, some demand has emerged from Africa for completely assembled watches. Negotiations to supply completed watches from stock are in progress.

Century spinning's 1978 results are *impressive, with gross profit advancing* by near-60 per cent from Rs 15.73 crores following only 11.7 per cent rise in net sales. These figures demonstrate substantial increase in profit margins. Dispite substantially increased tax liability, net profit is Rs 11. 60 crores compared to the previous year's Rs 7.25 crores. Dividend has been stepped up by only 3 points to 26 per cent, obviously to conserve cash resources to meet the requirements of additional finance for implementing the new projects. The company exported tyre yarn, tyrecord and rayon fabrics worth about Rs 1.66 crores to the US, UK, Europe, West Asian countries, Australia, New Zealand, Japan, and other countries. It also exported cloth worth Rs 10.15 crores to Europe, UK, the US, Canada, USSR, Australia, etc, and won approbation of cotton Textiles Export

Promotion Council. The textile division performed well. The withdrawal of controlled cloth obligation scheme, from October last, has brought about some long-awaited relief to the industry. The rayon, tyrecord, and other divisions at Kalyan experienced labour agitation with "a few serious acts of violence, intimidation and indiscipline" for about four months. In order to help exports of rayon fabrics, 20 per cent of production of the rayon industry has been earmarked for cloth exporters at concessional rates, which according to the management, are below the industry's cost of production.

SWADESHI POLYTEX has turned out poor results for 1977-78, due mainly to lower sales realisation, because of competition from imported polyester fibre. Production was only slightly lower, at 5,674 tonnes against 5,727 tonnes in the previous year, despite a 50-day strike at the factory. The company was at a disadvantage compared to some other indigenous manufacturers in terms of excise duty rebate allowed on the basis of average past production. As its production in the base period was comparatively high, at around 4,000 tonnes, the excise duty rebate was allowed only on production in excess of this quantity. The company sold 4,861 tonnes of polyester fibre against 5,053 tonnes in 1976-77 and sales aggregated only Rs 13.05 crores against Rs 17.16 crores. Gross profit declined marginally, from Rs 2.51 crores to Rs 2.31 crores. Included in the latest completed year's profit, however, is a sum of Rs 91 lakhs written back from the earlier provision made for meeting the liability arising from export obligation, since the government has waived with retro-active effect the export obligation. Thus it is clear that the company's profit would have suffered a steep fall, but for this item of non-recurring nature. Dividend is lower by 3 points to 12 per cent which, according to the published accounts, is covered 1.72 times. The company has since commissioned its DMT recovery plant. It is seeking doubling of capacity to 12,200 tonnes per annum. Its application has been referred to the MRTP for enquiry Commission. The management is hopeful of getting the necessary licence. The research and development team of the company has modified the fibre characteristic so as to enable spinning at very high spindle speeds — hitherto not possible with standard fibre. The modified fibre has been tested in various textile mills and the management has planned to commercialise it in the current year. Khadi and Village Industries Commission has sponsored a research project in the company to optimise not only fabric constructions but also the polyester blend compositions of Khadi fabrics for shirting and dress materials. The company also provided technical assistance to KVIC in Murshidabad for the production of extra-super-fine muslin type khadi fabric using 0.9 denier 'Jailene' in blend with Indian cotton. The management says that there has been some increase in ovrseas prices of fibre, which may help support prices of indigenous fibre.

ASSOCIATED BEARING has suffered a setback in its performance during 1978 because of the four months' strike at its factory which spanned the first three months of the year. Net sale declined from Rs 19.86 crores to Rs 18.16 crores, and gross profit fell from Rs 4 01 crores to Rs 3.48 crores. According to the management, sales would have been higher by Rs 7 crores had there been no strike. Profit margins have also decreased slightly. Production has returned to normal following the new settlement with the union, which will remain in force upto the end of 1980 Demand for the company's bearings continues to be firm, as industries which are their main buyers — such as automobiles, electric fans, electric motors, diesel engines and agricultural tractors — have registered increase in their respective production levels. In the textile field, market conditions showed rapid improvement from the beginning of 1978 after a recession of almost three years. Textile mills have started investing more funds for rehabilitation and expansion, leading to a larger demand for ring frames where the company's components are used. The improved market conditions are likely to continue during 1979 and the company hopes to achieve higher sales of textile components this year.

COATES OF INDIA, which has brought down non-resident interest in its share capital to less than 40 per cent, has shown satisfactory performance for 1977-78 and is raising dividend by 2 per cent to 18 per cent. Enhanced distribution on increased capital is covered 1.59 times. The management has decided to diversify the company's activities into a high technology area to take full advantage of its existing technology and infrastructure. Negotiations were finalised for the acquisition of a majority interest in another newly formed company for this purpose, but this has run into difficulties. The management is now exploring other opportunities for diversification. The directors view the current year's prospects as satisfactory, although the prolonged printers' strike in West Bengal area following the devastation caused by floods has been a depressing feature.

M M RUBBER has undertaken a project for manufacture of biaxially oriented polypropylene film (BOPP), which is a superior and cheaper substitute for cellophane film. The project is being set up at Ranipet, a declared 'backward' area of Tamil Nadu, and is expected to go on stream in the latter part of 1979. At full production, the new product will add about Rs 4 crores per annum to the company's turnover and also enhance profitability considerably. Meanwhile, the company has turned out good results for the year ended September 1978, with sales rising from Rs 3.82 crores to Rs 4 19 crores and profit after tax from Rs 5 lakhs to Rs 7 lakhs. The proposed dividend of 10 per cent will absorb Rs 4 lakhs. The company has retained its leadership in the foam rubber field and has established centres for after-sales service at its depots in Bombay, Madras, Delhi, Calcutta, Bangalore and Hyderabad in order to serve the growing clientele for its products.

NEW DELHI

Scuttling Indian Know-How in Fertilisers

B M

THE report of the so-called expert group on the choice of a foreign collaborator for the proposed 1,350 tonnes per day ammonia plants based on Bombay High gas has some curious features which deserve close attention before the government takes a final decision on it. It is understood that the choice of the group has fallen on a fresh entrant to the fertiliser scene in India, a US firm called C H Brown. The other bidders who have done some work in India for setting up fertiliser plants in the past in association with one or other Indian public sector agency have been rejected. According to knowledgeable sources, C H Brown is not among the leaders in the field and its experience in setting up large fertiliser plants, specially in the range of 1,350 tonne per day and above, is nowhere near that of some of the competitors, such as, for instance, Kellogs of USA or Halder Topsoe of Denmark.

Another and more curious feature is the recommendation in respect of technical fees that are proposed to be paid to C H Brown for its collaboration. It is understood that this firm had, to start with, quoted a fee of Rs 20 crores for one plant. But it transpires that on the conclusion of negotiations with it by the expert group, the amount of fee has been increased to Rs 40 crores. This interesting development has come about because the Indian experts themselves insisted that its role and area of responsibility for the construction of the projects should be larger than the firm had envisaged for itself while making its original bid. In addition to providing process know-how and basic design and engineering services, the foreign collaborator has been called upon to provide supervisory services for procurement of plant and equipment indigenous as well as foreign, and for detailed engineering, erection and commissioning of the plants as well as overall management of the project This enlargement of its services, it is argued, entitles the collaborator to a larger fees.

The arrangement is justified on the ground that this will help to ensure speedy construction and sound erection of the project since, in the view of the expert group, Indian technical agencies are not good enough and cannot be relied upon to assume responsibilities beyond functioning as sub-contractors and understudies of the foreign collaborator. The upshot will be that, if the government finally approves the expert groups recommendation, we will revert to almost total turnkey arrangements for the setting of the new fertiliser plants. This will be an extraordinary development after building a score of large fertiliser plants in the country in which Indian technical agencies have competently played the role of prime consultants and have performed well enough to win recognition of even the World Bank for their ability.

The justification advanced by the expert group is simple enough — that Indian agencies do not have any experience in setting up fertiliser plants of capacity higher than 900 tonne per day. Why mere scaling up of the size of a plant, without basic modification of process know-how and design, should disqualify Indian agencies and restrict their role to that of understudies even in detailed engineering and supervision of erection, is difficult to understand. But arguments along these lines in favour of maximising foreign collaboration is a familiar experience in our country, more specially in the case of the fertiliser industry since its expansion was launched in a big way in the mid-sixties.

From 600-tonne plants which were taken up for construction as the starting point, it was decided to shift early in the seventies to 900-tonne plants even before the first generation of plants were installed and stabilised. The story is being repeated with the decision to launch the proposed 1,350-tonne plants. With every scale-up of the size of the plants, it has been found necessary to rely on "experienced" foreign firms to do the job since Indian agencies were always found inadequate. The experience, to the extent it is gained, in the setting up of one generation of fertiliser plants, is thus dismissed as of no consequence for the purpose of the next generation of plants. Essentially turnkey arrangements are favoured with every switch-over to bigger size.

The only exception to this trend was in the setting up of some of the 900-tonne plants. Indian technical agencies were able briefly to assert themselves in certain favourable circumstances and were able to convince even the World Bank specialists with their capability. Even here the condition was that they had to agree to supervision and monitoring of their work by some foreign firms — a condition to which they submitted. It was thus that they succeeded in securing a right to a substantial share in the construction of some of the World Bank financed plants, among them those at Nangal and Sindri.

But several "weighty" reasons were soon discovered to revise official policy in regard to the setting up of new fertiliser plants. It was argued that speed of construction and reliability of operations demanded that all eggs should not be put in one basket, especially an Indian basket. These arguments were advanced to invite a Japanese firm to set up plants of even 900-tonne capacity on what was called a "crash basis", side by side with the plants being set up under World Bank approved terms by the design and engineering division of the then unified Fertiliser Corporation of India.

Most interestingly, this line of reasoning was extended to apply to even the management of operating plants. A scheme for the break-up of the Fertiliser Corporation of India into smaller, and what were claimed to be more manageable, corporate bodies was pushed through with unusual energy and determination. How far the break-up of the FCI has served the ostensible objective of improving efficiency of the production units, of the design and engineering services or even of marketing is a moot point and will require detailed examination to determine.

But the more noticeable and direct consequence has been the sequestering of the design and engineering services which had been built up over the years with so much painstaking effort by a band of dedicated scientists and engineers in the FCI. The Planning and Development Division of the FCI has been restructured as part of reorganising FCI to be made an independent engineering and consult-

ancy company named Fertiliser Planning and Development India Ltd (FPDIL). But it is the one corporate body, out of the five which were created by breaking up the FCI, which has remained without an executive head and a functioning management body. It is also not without significance that FPDIL and its specialists have not been given any worthwhile say in the arrangements which have been negotiated for the setting up of the proposed 1,350-tonne plants. The entire decision-making process in this connection has been assumed to be the prerogative of the civil bureaucracy in the Petroleum and Chemical Ministry in association with a few selected executives in the industry known for their hostility towards Indian technical expertise.

It is learnt that the ruling fees of a foreign firm for the supply of process-cum-basic design engineering for the proposed 1,350-tonne ammonia plant are of the order of Rs 8 to 10 crores. If detailed engineering is entrusted to FPDIL, which it has the proven capability of undertaking, the cost of its services will come to about Rs 15 crores. But under the arrangements being negotiated, the foreign firms alone are being offered as much as Rs 40 crores.

It is argued that these additional fees will ensure speedy and reliable construction and any stoppage or shortfalls will carry stiff penalties for the foreign collaborator. This is exactly how arrangements in favour of Toyo of Japan for the plants at Bhatinda and Panipat resulted in the payment of double the fees paid to the FCI for the same work at Nangal and Sindri. Performance-wise, the work at Nangal and Sindri has a definite edge over what has been done at Bhatinda and Panipat.

The contention of Indian technical opinion, which wants to limit foreign participation to the minimum essential, is that the share of the foreign collaborator in technical costs can and should be reduced to the proportion of one for the foreign services and three for Indian services without any risk. This is the position with respect to the construction of the far more difficult coal-based plants at Talchar and Ramagundam. Again, even in the case of the World Bank-aided projects at Nangal and Sindri, the two sides were able to share these costs half and half. There was no reason why the Japanese should have been allowed for similar plants at Bhatinda and Panipat to double their share of technical costs. It will be worse if, as appears likely, the technical fees to be paid to foreign collaborators for the proposed plants based on Bombay High are further raised.

POLITICS

Money for All

Mohan Ram

WHATEVER be the truth of former US Ambassador Daniel P Moynihan's claim about secret US Funds being made available for the Congress party at the 1967 elections — and in 1959, directly to party President Indira Gandhi — the fact is that the Government of India itself has admitted that foreign money did play a role in the 1967 elections.

After the 1967 elections, following widespread apprehensions and allegations about foreign involvement, the Government of India instituted a discreet inquiry into the matter. The report of the Intelligence Bureau which was entrusted with the inquiry was not made public But the New Delhi correspondent of a leading US daily reported in 1968 that the inquiry had established that all the important political parties had benefited from foreign funds in the 1967 elections. The government dismissed the newspaper report as a conjecture but would not go beyond sharing with Parliament the cryptic conclusion — that foreign money had played a role and the government would take measures to prevent such inflow of foreign funds in future. This assurance was the starting point which finally led to the legislation to regulate flow of foreign money to vital areas of Indian life, like political parties, academic institutions and the media.

Those early allegations about the role of foreign money in subverting Indian institutions and processes came in the wake of disclosures in the United States on the role of the CIA. What added to the fears in India was the fact that foreign governments held huge rupee resources; and these foreign governments included not merely the US with its vast PL-480 rupee accumulations, but also the Soviet Union and some other East European countries which too held rupee accounts (result of rupee trade) in India.

It is possible that the then Home Minister, Y B Chavan knew about the role of foreign money at the 1967 elections in all its ramifications and the report in the US newspaper was not altogether unfounded. When an embassy held rupee accounts, it was possible to divert funds to promote or thwart the chances of not merely a party, but also of a particular candidate. If the United States poured money to secure the defeat of the Communists in West Bengal in 1967 and in Kerala in 1959, it is equally possible (and almost certain) that money was also spent to secure the victories of 'progressive' candidates even from outside the Communist parties.

Much before the 1976 elections, Parliament had heard of the Bank of China's role in India. The bank had wound up its sole branch in India (in Calcutta) amidst deteriorating Sino-Indian relations. But following allegations that certain Indian communist leaders had benefited from their Bank of China connection, an inquiry was instituted. But once again the report, ready in 1965 or thereabout, was not published. The suspected reason was that the report had found that, apart from communists, prominent personalities of the ruling Congress party and their families also had benefited from the Bank of China connection.

The reluctance of the government to take Parliament into confidence on the details of the Intelligence Bureau's report in 1967 elections is therefore understandable. The excuse given then was that the inquiry was not a formal one and the findings were not based on firm evidence. But what is rather obvious about the operations of foreign money is that the Congress, the Praja Socialist Party, the Jana Sangh and the anti-communist parties in general have benefited from western funds (not limited in origin to the United States) while the CPI and its 'progressive' allies inside the Congress and outside have been helped from the rival quarter. Since the Congress was involved, it would not have suited the government to say more about the findings than what Y B Chavan did in the Lok Sabha. It is also possible that the report of that inquiry might be unpalatable not only to the party which ruled India then but to the conglomeration that now constitutes India's ruling party.

LABOUR—I

New Threat to Public Sector Labour

Timir Basu

THE Bureau of Public Enterprises (BPE) has been of late emerging as a threat to public sector workmen. This is illustrated by the recent happenings in Garden Reach Shipbuilders and Engineers (GRSE) where some 10,000 workmen have been on strike since January 22. The workers' demands include implementation of the written assurances by the management in respect of settlement of their charter of demands. But what the authority agreed to concede was later withdrawn at the instruction of the BPE, thus reducing collective bargaining to a farce.

The Garden Reach Workshop (GRW), a joint venture of British India Steam Navigation Company and Rivers Steam Navigation Company, was set up in 1884 and was subsequently converted into a limited company in 1934. The firm was taken over by government in April 1960, since then its story has been generally one of steady growth and progress in production and diversification. The company is no longer a tiny dockyard engaged in ship repairing jobs; apart from being closely involved in production for defence, it manufactures vessels required for maintenance of ports, sophisticated equipment, road rollers, structural goods, to name only a few of its products. In West Bengal alone it possesses seven units and its new plant at Ranchi is specially designed to manufacture marine diesel engines with West German collaboration. Mahaganga, Asia's biggest estuarine dredger built by the GRSE, is being used by Calcutta Port Authority in the Sagar-Haldia channel.

The pay and allowances of the workmen of GRSE compare unfavourably with those existing in other public sector undertakings. The organisation is also understaffed and recordkeepers and cardwriters who are deployed for clerical work against their will are at the same time denied the status and remuneration of clerks. Draughtsmen do not get the appropriate grade while engineering diplomaholders are designated as supervisors. Office assistants have been kept outside the purview of industrial benefits rendered to different sections of workmen for no fault of their own. Nowadays an unskilled labourer draws an all-inclusive pay of Rs 440 per month while a highly skilled hand does not get more than Rs 561. A charter of demands presented to the management sometime in early 1977 included upward revision of wage, abolition of contractual practice, employment of apprentices after successful completion of training period, rationalisation of DA. The charter also demanded the reinstatement of four employees who were detained under MISA during Emergency and who were subsequently dismissed for alleged 'Naxalite' activities. The GRSE authority paid little heed to them, leading to further discontent among the workers and a token strike on December 31, 1978. Discussions with representatives of the employees who are now fighting under the banner of joint action committee comprising all the political trends followed in Delhi and some commitments were made by the authority. To back away now from that original commitment amounts simply to breach of trust but the GRSE management hardly differs from private sector management in this respect.

In a letter of February 26, 1979, addressed to the minister for defence production, the Garden Reach Workshops Mazdoor and Staff Union led by the AITUC urged the minister to go through the recorded minutes of earlier discussions between the representatives of workers and management as the records would speak for themselves why the workmen had to resort to strike. According to these minutes, on May 27, 1978, the joint secretary, ministry of defence production, had assured in writing that "the workmen would not lose anything in view of the fact that the ensuing settlement which would be arrived at for a period of at least five years might be given effect from January 1, 1977". The managing director of the GRSE was a party to this commitment. What is more, on July 11, 1978, the managing director had further agreed that "workmen would not lose anything since the agreement so arrived would be given effect from January 1, 1977" and that the "charter of demands in respect of the workmen of GRSE would we settled irrespective of the fact whether the tripartite engineering settlement is finalised or not". Again on January 18, 1979, the minister of defence production had assured the workmen that all commitments, whether written or verbal, would be honoured.

On March 8, the forty-sixth day of strike, the joint action committee appealed to the Union defence minister to intervene. According to the joint action committee, the workmen were compelled to go on strike because the GRSE management, at the instance of BPE, had refused to honour written commitments. Earlier on March 3, the central trade union had called upon the Union government to direct the management of GRSE to settle the disputes through collective bargaining in terms of the agreed commitments.

The crux of the matter seems to be that the BPE has been urging the GRSE management to agree only to a settlement in accordance with the tripartite agreement in engineering industry in West Bengal. If a settlement in accordance with that tripartite agreement were to be imposed in GRSE, the workmen will lose even many of the existing rights and facilities, let alone the extra benefits which they are demanding and which are presently enjoyed by employees of other public sector undertakings. All that the GRSE authority is willing to concede is just Rs 500 in lieu of back wages.

What is happening in GRSE needs to be seen in the context of the Bhoothalingam panel's recommendations. The wage freeze and the attempt to evade written commitments implicit in the actions of the GRSE management will further encourage private employers to indulge in similar practices. The expenditure on labour has gone down to 12 per cent in recent years against 36 per cent in early sixties in terms of annual production value. The BPE wants to lower it further.

LABOUR — II

Poor Award for Textile Workers

Sandeep Pendse

EVERYONE was impressed by the award in the Bombay textile labour wage dispute announced on April 13 by the chief minister of Maharashtra and the Union Industries Minister. The media made sure that everyone would be impressed. The award was described as epoch-making, unprecedented, etc. The textile workers, however, were not impressed; they were disappointed. The largest rally of the campaign was on April 15, called by the unions which rejected the award. The protest strike on April 16 (once again described by the media as a 'failure') evoked a larger response than expected by most; 60 to 70 per cent workers participated in the strike; 30 mills were affected; eight were completely closed and the rest had nominal attendance. Another eight mills, claimed to be strongholds of the striking unions, were also closed, as Monday happened to be their weekly holiday. The statement of the Rashtriya Mill Mazdoor Sangh (RMMS), which actively opposed the strike, also broadly accepts this claim, though unwittingly.

The protest strike was, however, only symbolic. The threatened indefinite strike has been averted, or rather aborted. The RMMS, never a part of the move, sought the first opportunity to back out. The Girni Kamgar Sabha (GKS) of Janata heaved a sigh of relief and, expressing its satisfaction with the award, called off the strike. The three red-flag unions, *viz*, Mumbai Girni Kamgar Union (AITUC), Lal Bavta Mill Mazdoor Union (CITU) and Mumbai Kapad Kamgar Sanghatana (Lal Nishan), were not in a position to carry out an indefinite strike on their own. A protest was registered but the award has been imposed. Peace has been secured, however temporarily.

Many things about the award, its method as well as its terms, are objectionable. The workers have every reason to feel cheated. The basic problems have remained unsolved. The award grants an increase of Rs 45 pm net. The workers will also get an annual increment of Rs 6 p m, including DA, for the next five years. Considering the indirect burden (provident fund, ESIS, leave wages, bonus and gratuity) the total gains are Rs 61.26 p m. The disappointment with this figure is not unreasonable if the current trend in other industries, the demands of the workers and the existing conditions of textile workers are taken into account.

Wages in the textile industry are surprisingly low. In spite of the history of organisation and struggle (as well as the organised large-scale nature of the industry), the textile unskilled worker gets only Rs 468 p m, if he gets work for 240 days or more in a year. Further, there are no fixed wage scales with definite annual increments, he gets no casual leave, his jobs have not been classified and standardised and 240 days of work in a year is a compulsory condition to avail of any casual leave whatsoever. There is in addition the problem of 'badli' (leave vacancy) workers, who have no guarantee and security of employment. 'Badli' workers form nearly 30 per cent of the total workforce in the textile mills of Bombay. There are in addition a sizeable number of workers employed on contract basis.

An overhauling of the entire structure of service conditions rather than a mere wage rise was thus the natural demand of the textile workers this time. The rising profits of the mills over the last two years (seen by the workers in the working of all machines in all the shifts) had added to the workers' determination. The recent jute industry settlement of West Bengal had been cited by the unions. The jute workers not only received Rs 65 as wage rise but also secured a committee to go into the question of standardisation of service conditions and guarantee of wages for leave vacancy workers. The terms of the award which ignore these problems were unsatisfactory.

The manner in which the award was given was equally objectionable. The red flag unions have termed it as a betrayal and a unilateral imposition. Neither the chief minister nor the Industries minister had been accepted as an arbitrator, except by the RMMS. The four other unions, including the GKS, had agreed to mediation only. The settlement was to be between the unions and the Mill Owners' Association. The unions had in fact insisted that no figures should be announced without consulting them. The evening of Friday, April 13, saw a virtual breakdown of negotiations. The owners, starting with Rs 12 p m as the increase, refused to move beyond Rs 29 p m. The non-INTUC unions asked the ministers to end the mediation efforts. The strike seemed certain. The ministers however asked for a few hours more, to make a final effort. The union representatives were called to the chief minister's residence at 9 p m. At the scheduled hour the award was announced simultaneously to the press and the unions. There were obviously no negotiations. All specific undertakings had been ignored. The minimum demands of the workers had been trampled upon. Only the Janata union could pretend to be happy. With the involvement of George Fernandes, it could not have done otherwise anyway.

The role of the GKS in this dispute had been dubious from the beginning. Its very formation in 1977 was more a political move of trying to consolidate anti-Congress feelings than a trade union initiative. The focus of its attempts had been to displace the RMMS as the recognised union. It did not really challenge the unpopular Bombay Industrial Relations Act, but only sought a secret ballot within its framework to determine the representative union. The tendency of this union to withdraw from the struggle at the last moment had first become evident in 1977, at the time of the bonus struggle. This time too its uneasiness with the developing situation and the looming strike was visible. The strike was scheduled originally for March 29. It was postponed in response to an appeal and assurance of mediation by the chief minister on the floor of the Assembly. The GKS's efforts at mobilisation till then had not been much in evidence. Even later it was not very much noticeable.

GKS had to ally with the red flag unions as one of the compulsions of the situation. Not a single joint meeting was held nor was any joint statement ever issued. Persistent suggestions (by the Lal Nishan's MKKS) to create a general council for the strike, consisting of worker activists of all unions, were turned down. It was also suggested that the terms of the award should be approved or rejected by a meeting of worker activists from all the mills. This too

was turned down. This form of democracy was considered by the GKS as unworkable.

Political considerations, it is clear, have shaped the award. The demands of the RMMS have been met to a large extent. This, it is hoped, will stem the steady erosion of its base. At the same time, the involvement of George Fernandes is expected to enhance the prestige of the GKS. The communists, it is thought, have been isolated. The efforts made by the RMMS and GKS activists to coax the workers (and in places to force them) to go to work on April 16 certainly indicated new alliances. It was a confrontation between the communists and the anti-communists. Polarisation among textile workers will certainly be rapid in future. The lines are getting drawn more sharply.

Coal-Railways-Steel Tangle

ONE of the curious features of the Indian polity is that once a problem crops up, it hardly ever is solved, even partly. The backlog of unresolved problems continues to mount and people learn to live with it. A typical case is the wrangle between the railways and the coal department which has been going on for over the last one year. At the start it was all a kind of joke about how our government works, or does not work, but in course of time it has become a tragedy that can cost the nation dearly.

The whole episode is so full of contradictions that it is difficult to understand how such a situation could arise at all. The coal department is saying that there are nearly 13 million tonnes of coal at the pitheads and that, except a small part, much of this stock is eminently usable. Curiously, coal production in 1978-79 is not likely to be any higher than in the previous year. The final figure is likely to be around 102.5 million tonnes at the most, against 101 million tonnes in 1977-78. It would thus be fair to conclude that the Indian economy has burnt less coal during the current year. And yet the industrial sector has still managed to achieve a growth rate of something like 8 per cent. How could this happen?

Similarly, the railways are claiming that the rate of wagon loadings in the vital Bengal-Bihar coalfields during the first two and a half months of 1979 has been higher than in the corresponding period of the previous year. The railways would like us to believe that the bottlenecks lie in slow loading and unloading operations which do not fall within their area of operation. The question is if the railways are doing their part of the job so well, how is it that one industrial unit after another is being forced to go in for road transport, though road transport rates for coal are being merrily raised? How is it again that complaints are pouring in from all parts of the country of coal shortage?

By early March a situation had developed when the five public sector integrated steel plants (Rourkela, Bhilai, Bokaro, Durgapur, Indian Iron) were virtually forced to scrape the bottoms of their barrels to keep themselves going. Their total stock of coal at one time had come down to just about 110,000 tonnes against a norm of about 500,000 tonnes.

The steel authorities managed to save the situation, as they had done on similar occasions in the past, by cutting down drastically the number of coke oven pushings. Some of the ovens were blanked out and some of the units just managed to carry on by hurriedly drawing upon the imported low-ash coal without even waiting to get it blended with local supplies. But there is a limit to cutting down the number of pushings and, if the emergency situation continues for much longer, the health of the coke ovens may be severely affected. That would create an entirely new type of problem. But who is afraid of such things? Not certainly the government.

Ever since the dislocation caused by the flood during the last monsoon, the railways have been faced with a backlog of held-up traffic. It is also believed that a larger-than-usual number of wagons are now out of circulation as they are not fit for use because of missing parts of delayed repairs. In the past, when the pressure on the wagon fleet was less, the railways could afford to leave wagons in the colliery sidings for longer hours for loading or unloading. Now they cannot, but the efficiency of coal handling cannot be raised by pressing a push-button. Sometimes even half-filled or half-emptied rakes are taken out of the sidings and the wagon turn-round time has become longer.

For all this, the authorities cannot ignore, ostrich-like, the real problem. The hard fact is that the level of discipline in our railways and in our coal mines is steadily going down and the crisis is but a symptom of this malaise. The government in its wisdom has chosen to keep the question of bonus for the railway staff hanging for a long, long time. It is certainly an issue of wide-ranging implications but what is difficult to understand is what the government expects to gain by dragging its feet over it for month after month. On the coal front also the workers are pressing for a rise in their minimum wages and increases in other fringe benefits. They had already observed a one-day token strike on February 5 and are expected to take a decision on whether to go on an indefinite strike soon.

As past experience shows, labour productivity and discipline, which even in normal times are not something to write home about, are always the first casualty when workers prepare for some sort of 'action'. And what is happening in the two primary sectors of our economy only confirms the truth of this statement.

The Janata government has been calling even the smallest of the small unions in all-India industries like steel, coal and railways to the conference table, irrespective of whether they are recognised or not. But the trade union culture — to use a much-used word in these days — being what it is, the gesture is only construed as licence to do many things that should normally not be done. Side by side, the country's political culture is also such that ministers would rather bash at the chairmen of companies than at the trade union leaders. But, there are good men and bad men in all groups and till the authorities learn, and choose, to make a distinction between them, things would continue to remain much the same.

The coal-railway controversy has become only the most demonstrative case of how a problem should not be tackled. There must be other such cases. They call for a little more co-ordination between the administrative ministers. Is that too much to expect?

Colombia: Another Chile, Argentina?

Rosemary E Galli

AMERICANS are very familiar with Madison Avenue's stereotype of Juan Valdez, the hardy Andean Mountain coffeegrower, carefully selecting his beans for export to the United States. They know by ill repute his counterpart in the semi-arid low-lying plains of the Guajira supplying the well known Colombian gold on contract. Yet, beyond these stereotypes Colombia remains a mystery. And that is the way the government of President Julio Cesar Turbay Ayala would prefer it to be. For behind the smile of the proud Juan *and the lucrative harvests of dreams* and behind the facade of civilian government, dubbed by President Carter as a bastion of civil rights, lies the bloodied baton of military rule. For over twenty years, Colombia has been under the classically Latin American state of seige.

Military repression is not new to Colombia: peasants have been its object since the beginning of Spanish conquest. In the twentieth century workers, too, have felt its heel. The massacring of striking banana workers on United Fruit plantations is celebrated in Garcia Marquez's "One Hundred Years of Solitude". Under the government of President Lopez (1974-1978) strikes themselves were declared illegal. In 1977, on the occasion of a general strike in September, the government sent out the troops to "keep order". The death toll is unknown but over fifty deaths were reported in the US press.

Since 1978, the army has made a sweep of national universities, arresting and torturing students suspected of urban guerilla activities. As reported in the *Chronicle of Higher Education* (December 4, 1978), 34 students were alleged to have undergone torture, causing an outcry in the country. Now that outcry is being stifled as the military turns its weapons against all unorganised left opposition among the middle classes. Doctors, lawyers, architects, university professors, ex-magistrates, retired military personnel, artists, editors have been rounded up and subjected to the ten day detention rule by the military. Also arrested were the editor of *Siglo XXI* and several other Argentinians, a number of Uruguayans alleged to be tupamaros and several Germans, one of whom was an arms dealer (*El Espectador*, February 4). More than 3,000 have been rumoured to have been arrested during January 1979. The exact number is unknown. Five are said to have died under torture.

The pretext is a sweep of the country for militants operating under the banner of the Movimiento — 19 (M-19), an urban guerilla group that arose in 1974 to carry out a number of spectacular operations including kidnapping, assassination and the January robbery of over 5,000 weapons from a Bogota military arsenal. The M-19 was borne out of the deep sense of frustration with electoral politics in Colombia. Since its independence from Spain the the country has been ruled by one of two parties, Liberal and Conservative, and for many years was ruled by a coalition of the two parties under a National Front. In 1970 that coalition was challenged successfully by a populist party known as ANAPO. However, the outgoing government defrauded the electoral count on April 19, 1970, and ANAPO was not allowed to take power. The name M-19 refers to that event.

Among Colombians at large, elections have little significance; only 35 per cent of the population generally bothers to vote. Thus the great mass of people express their dissatisfaction through passive resistance. The M-19 represented a small proportion of people — generally intellectuals and upper and middle classes — who chose the path of open and violent confrontation with the political system. This contrasted radically with the growing numbers of intellectuals, workers and peasants who have been organising to form electoral coalitions and platforms for a constitutional seizure of power. Neither segment of the left has a mass following and only a strategy of a broad alliance of opposition offers such a possibility.

The M-19 has provoked the confrontation it was seeking: the Constitution has been suspended; the military has taken over the enforcement of law and order and the violence is escalating. But instead of polarising society, the situation has only allowed the military to consolidate its power further, to pick off its "enemies" one by one and to institutionalise torture as another instrument of repression.

The "enemies" not only include the left but any outspoken critic of the government. The government decrees suspending the civilian judicial process, known as the Estatuto de Seguridad, have been under attack by Supreme Court justices. On February 9, these justices were publically threatened by President Turbay for not toeing the official line. On that same day, it was announced that a young niece of one of the justices, Maria Velasco, a sociologist of the National University in Bogota, was arrested by the military. The three top sociologists in the country have been arrested: Orlando Fals Borda, Maria Cristina Salazar de Fals and Saturnino Sepulveda, all awaiting charges. An internationally known anthropologist, Nina Sanchez de Friedemann, was dismissed after fifteen years in the Institute of Anthropology for refusing to sign a letter of loyalty to the director of the Institute. She was the twelfth such anthropologist to be fired for this reason. Her life has been threatened.

As the repression grows, Colombia begins to take on the aspect of Chile and Argentina. Why? One reason we have seen is that the Colombian political system has lost all claim to legitimacy, at least among the great majority of people in the country. The Employment Programmes begun under the Pastrana government in the 1970s

and the Social Welfare Programmes initiated by Lopez Michelsen in 1974 have failed or at least have not had much impact; they are thus being replaced by open military coercion in the Turbay government.

In Colombia, as in most parts of the world, the divide between rich and poor has widened in the 1970s. Close to 80 per cent of the land is monopolised by a small number of families. Nineteen thousand individuals control more than 17 million hectares out of a total of approximately 24 million hectares in agricultural use. On the other side of the equation were one million peasants farming only about 7 per cent of the land and receiving somewhat more than 20 per cent of agricultural income.

Colombian workers had been experiencing a decline in real wages since 1970; their income in 1978 was 87 per cent of what it was in 1970 in real terms. Workers' salaries made up only 37.9 per cent of the total GNP in 1977, a figure also in decline. The very limited dimensions of the internal market has meant that Colombian industry has had to find export markets in order to expand and also in the direction of capital-intensive rather than labour-intensive technologies. Thus, Colombia, like most Third World countries, has found itself facing a paradoxical situation of rapid industrialisation and growing unemployment. Open unemployment in 1975 was 14 per cent. This figure did not include underemployment which was calculated in an official Census of 1964 as 18.8 per cent in agriculture, 17.55 per cent in industry and 17.18 per cent in the services sector. The unemployment situation has continued to be aggravated by peasant migration to the large cities. Bogota is one of the top ten fastest growing cities in the world.

The coffee "boom" of 1975-1977 increased Colombian reserves to US$2 billion but it also caused a rampant inflation in the country. The Federation of Coffee Growers invested much of the coffee profits in US Treasury Bonds, some of it in banks and industries, and the rest in speculative enterprises such as real estate. Another source of easy money has come from commerce in marijuana and cocaine. This money is laundered in many ways, but not in the form of productive investments to relieve unemployment. Moreover, the 35-40 per cent annual rate of inflation since 1975 has eaten away at the incomes of peasants, workers and the salaried middle classes.

Thus, Colombia finds itself in a similar, although less pronounced, situation as Chile, Argentina and Brazil: countries whose booming export possibilities have worsened the internal distribution of income.

In the face of increasing inequality in Colombian society, the government is called upon to contain popular discontent. Since the state represents only the ruling classes and mainly those profiting from coffee, drugs and other exports, it has no interest in modifying the social or economic structure and chooses to defend it with all the weapons at its disposal. What is *new* about the present stage of repression is that it has not only turned against the left, and particularly the petty-bourgeoisie of the left, but has also spread to dissenters among the aristocracy.

UNITED STATES

Heroic Victims

Noel Castelino

THE Oscar awards can be very handy tools in the rewriting of history. Having received its measure of Oscars and critical acclaim, Michael Cimino's film, "The Deer Hunter", is bound to reach millions of cinema-goers around the world in the years to come. The film is an attempt to depict the Vietnamese people as a barbarous race and the Americans as well-meaning people who somehow blundered into an Asian snake-pit.

Three young steel-workers, Michael, Nick and Steve, are called up for the war from the warmth of their closely-knit Russian immigrant community in Pennsylvania. We see a traditional Russian wedding against a backdrop of American flags, with lots of dancing, loving and vodka, followed by a deer hunt amidst some beautiful scenery in the Alleghany mountains.

The scene shifts without warning from a quiet Pennsylvanian bar-room to a Vietnamese village: a group of women and children lie huddled in a shelter. An NLF soldier discovers them and flings in a grenade. A woman runs out with her baby and the soldier takes aim. But Michael (the deer hunter) is at hand and stops him dead with a flame-thrower. Justice is meted out and the American presence vindicated.

Michael, Nick, Steve and some others are now held in a cage by NLF guards whose favourite pastime is a form of gambling in which their prisoners are forced to play Russian roulette. The images are explicit: a prisoner takes a gun to his head. The suspense mounts while he hesitates. The sadistic commissar goads him on until he pulls the trigger. Jets of blood are shown streaming out of his head as he subsides to the ground.

The three Americans manage to escape. Nick ends up in Saigon's underworld as a drug addict and professional player of Russian roulette. It seems that the Vietnamese on both sides love to bet on this game, especially when there are white players to provide extra titillation. Steve returns to Pennsylvania as a cripple and Michael as a decorated hero. Michael makes an attempt to rescue Nick from Saigon but the latter loses an ultimate game of Russian roulette. The film closes to the strains of "God Bless America" after Nick's funeral in his home town.

This film is the kind of lie that says: "The truth is more complicated than you think." It admits that the Viet Nam War was a mistake and then identifies the main victims of that war as Americans. In a recent interview with a French film and television magazine called *Telerama*, Michael Cimino said he had not found any time (in this three-hour film) to depict the sufferings of the Vietnamese. "The Deer Hunter" is thus an attempt to exorcise the demons of the past without coming to terms with the disaster visited upon the land and people of Viet Nam, like someone who keeps returning uncomprehendingly to the scene of his crime.

The film is also distinguished by its lack of moral and aesthetic integrity. In his interview, Cimino said that the Russian roulette scenes (he could not vouch for their authenticity) were necessary to create suspense. It is a measure of the decadence of this film that it should draw upon all the resources of colour photography and wide-screen projection to create fear as the medium for a political message. In doing so it brands itself unmistakably as the product of a corrupt and heavily armed society and reveals a trend that bodes ill for the future.

A Political Testament

If I Am Assassinated... by Zulfikar Ali Bhutto; Vikas, New Delhi, 1979; pp 243; Price Rs 35.

FROM March 18, 1978 when the Lahore High Court announced its verdict in the Nawab Mohammad Ahmad Khan murder case sentencing Zulfikar Ali Bhutto and four others to death to the early morning of April 4, 1979 when Bhutto was hanged, he was confined in "a congested and suffocating death cell" in the Lahore and Rawalpindi district jails. It would be unfair to judge a book written under such conditions, "with the paper held on my knees", as anything but a political testament. The book is actually two books in one.

Part of it, almost the whole of the first eight chapters, is an attempt at refuting the voluminous White Paper that the martial law regime produced on the "Conduct of the General Elections in Pakistan, March 1977" which sought to show that the widespread protests (which the Bhutto regime suppressed with a heavy hand, and in the course of which more than 200 people were killed before Bhutto himself was deposed) against the "rigging" of the elections were based on legitimate grounds, for the Bhutto regime itself had maintained voluminous records of such plans for rigging. Bhutto's efforts to discredit the White Paper are anyway not very successful; but no matter. What comes off most strongly in this part of the book is the tremendous confidence that Bhutto displays, so much so that frequently he is admonishing his tormentors for not presenting a more credible case against him.

But the interest of the book does not lie in the rather unconvincing refutation it attempts of the charges of rigging the March 1977 elections, or in the more convincing and telling points Bhutto has to make on the findings of the second White Paper which details the "misuse of mass media" under Bhutto. What is of greater interest and also of greater political relevance is the 'other book' interwoven into this testament (roughly the last five chapters) constituting Bhutto's reflections on Pakistan and its place in history which also amount to Bhutto's reflections on his own place in history.

Bhutto never lost faith in the system that had produced him even though he was on the point of being killed by the very instruments he had devised in defence of that system. That Bhutto was so much a child of the system, that he was so authentically a product of the Indian muslim gentry which provided the political and intellectual leadership to the Pakistan movement is again and again demonstrated in this testament where the dominant note is one of outrage.

One of the charges made against Bhutto was that he perverted and almost destroyed many of the established institutions in Pakistan. But even though Bhutto might have subjected many of these institutions to severe strains, it is significant that he never tinkered with, never 'played politics', with the one permanent institution in Pakistan, the armed forces. Nor, for that matter, did he really attempt to break the power of the Islamists, and while scoffing at them, also pendered to them without a qualm. Thus, in this testament, almost before he properly gets going, Bhutto has to discredit the testimony of the secretary to the election commission on the ground that the person concerned was not merely related, albeit in a distant manner, to Masood Mahmud, the director of the Federal Security Force and the principal approver in the murder case which finally led to his conviction, but also on the ground that he was an 'Ahmadi' and so bore a grudge against him (Bhutto) for the measures he took in declaring the Ahmadis to be a 'minority community' in Pakistan. That measure, like the other measures taken by Bhutto towards the end of his rule, was entirely in character, for it is most unlikely that Bhutto himself had any strong views on the matter; the party he headed had anyway more pressing priorities and had made more material commitments to the people; and yet, the last weeks of Bhutto's rule were occupied with initiating many measures to further 'Islamise' the country, for which, to go by the evidence of this book, Bhutto took great pride.

Or take the matter of the army and its role in the politics of Pakistan. The testament shows that Bhutto held only the conventionally 'correct' view that the armed forces should not be allowed to 'play politics'. It also provides many details of how it was he who nursed and cherished the Pakistani army and give it the muscle to enable it to strike at its master. He even quotes Zia-ul-Haq's own testimony to the effect that under Bhutto, the Pakistan army received the utmost "attention and affection", and yet is paradoxically outraged and indignant that the army should want to bite the hand that had fed it so generously. He even goes to the extent of arguing that Islam is in danger under the generals — a less than credible tactic to mobilise opposition to the generals.

In fact, these reflections on Zulfikar Ali Bhutto and his place in History (naturally with a capital 'H') are a strange mixture of potted history, fictional recreation of the past (there are references to Bhutto's anti-imperialist pretensions going back to his school days, and a letter to the French President written from the death cell which speaks of Bhutto's being a follower and fellow freedom-fighter of Jinnah and Nehru), reflections on the destiny of Indian Muslims and the unique nature of the political system of the sub-continent with recondite references to both Ashoka the Great and the Panchayat system, rhetorical flourishes to the effect that the time for playing marbles is over and that his tormentor should cease to play at being the Mehdi, and many dark references to mysterious, but identifiable 'foreign hands' who are accused of engineering his fall. At the same time, there is no attempt at examining his own role in the developments that culminated in the invasion, defeat and dismemberment of his country. Nor has he anything to say on the conduct of his regime towards the provincial governments in the Sarhad and Baluchistan or towards former leading members of his own party who had had left him, except to justify those actions on grounds of national security. Loyalty to Pakistan, in Bhutto's view, meant loyalty to him personally; and if the generals and the mullahs are damned as American stooges, any opposition to him from the Left was equally strongly damned as being communist-inspired

But this very incoherence is the strength of this narration; for better than any properly 'composed' book, the outpouring truly reflects the man, both his strengths and drawbacks. Zulfikar Ali Bhutto was very much part of an authentic lineage of political leaders of the sub-continent, though it is possible that other political cultures too have given birth to their own Bhuttos. What is universal to leaders of his mettle is an effortless graduation into positions of leadership by virtue of some very material advantages that they enjoyed.

[illegible] seems to have been, in most of these cases, influenced by mere habit and tradition, and not out of any deep convictions. This is not to suggest that they did not bring to bear on their chosen profession all their intelligence and even passion, and at some point in their careers, they perhaps even began to believe in their own rationalisations. They also succeeded in earning the goodwill and affection of the mass of people, not because they succeeded in ameliorating their miserable conditions, but because they highlighted this wretchedness with a view to using the disaffection as a weapon to fight their own battles.

The arrangement worked in the relatively civilised battles that these stalwarts of the freedom struggle in undivided India waged against their imperial masters — struggles in which the leaders themselves suffered few personal privations even as they further exhorted the mass of their followers to make the utmost sacrifices But the arrangement could not last under altogether altered circumstances, when fresh battles had to be joined against native rivals and opponents, broadly belonging to the same classes.

A notable feature of this testament is the fairly numerous references to India and its politics It is clear that Bhutto, like so many among the Muslim elite of the sub-continent, was both fascinated and repelled by "Hindu India' The feeling of repulsion is understandable, and Bhutto is unrelenting even in this last testament about his determination to keep Pakistan on a 'separate and equal' keel. But this obsessive desire to 'show' India that Pakistan is more than a match to her barely conceals a wistful admiration for this country's political culture. This is perhaps not very surprising, for Bhutto could have risen to great heights as a politician even, perhaps especially, in India Certainly, his credentials were much better than that of many 'nationalist Muslims' who were merely suffered by the Congress leadership; and he had greater talents and political intelligence to take him far in Indian politics

The question whether Bhutto's refusal to 'bend' before the martial law authorities and plead for his life was due to his hopeless belief that they would never dare touch him, or whether it was due to his conviction that he had indeed come to the end of the road and would not bear further humiliations, will never be resolved. Being an intelligent man, Bhutto probably saw the logic of the military coup and the inevitable course it had to take; but a [illegible] martial law authorities, in every sense his own creatures, could be actually planning to murder him — is also evident. The defiance that is in evidence throughout this testament [illegible] pride that as a civilian and duly elected leader he would not plead for his life with an army man, as to a different kind of price brone out of his awareness of his own position in 'History'.

India in 2000, with Ifs and Buts

Thomas Timberg

India in Perspective: Development Issues, Volumes I and II; Volume I by D N Basu, Volume II by A Lahiri and R Nagarajan; Arnold-Heinemann, New Delhi; Volume I pp 263, Rs 50 and Volume II pp 307, Rs 50.

THE books under review represent projections by various sorts of simulation and iteration of India's use of resources and development over the next few decades, done professionally and competently The attempt highlights the differing results that will follow from varying policy inputs and outcomes and highlights the policy choices presented

One is, needless to say, happy to inform the reader that the future is medium bright Under the worst of four scenarios — high population and low economic growth — the total size of the GNP will treble and per capita income a little less than double by the year 2000 Under the most optimistic scenario the total GNP will increase more than four times and per capita income almost triple Under the best of scenarios, only 2 per cent of the population will find themselves under the absolute poverty line (Rs 27 a month in this case) in 2000 and under the worst still only 30 per cent will be in absolute poverty These figures contrast with the figures in the "World Development Report, 1978" which, in talking about low income countries as a whole, gives a "base" scenario showing 27 per cent in poverty by 2000 and a happier "alternative" one in which 13 per cent are in absolute poverty. Even in the optimistic version sufficient foodgrains will be available, presuming the most minimal of technological improvement, and surpluses are considered highly probable. Sufficient supplies of aluminium and iron will be available and coal for fuel, though, unless prospecting turns out to be successful, large quantities of oil and smaller amounts of certain metal may have to be imported. The conclusion here reflects one of the limitations of the basically input-output nature of the matrix, since it excludes the sufficient development of alternative solar or nuclear or even fibre-based fuels to permit their economic substitution for oil — and these possibilities are explicitly disavowed on page 223 of Volume II. There is also an assumption that energy saving technologies will not change radically the industrial patterns of energy use.

We should note that the results of this effort by a team of researchers for the Operations Research Group in Baroda Parallel in general terms those contained in the Second India project (albeit probably most optimistically) and to some extent the work of J Kapur in Delhi as it has been described to me More broadly, this is of the genre of projections we have been deluged with since Forrester and the Club of Rome predicted global doom and suffers from the shortcomings of the genre The Russians have a saying that "if it weren't for the ifs and the buts he would have been a general a long time ago", in the same vein these surveys are no better, and sometimes worse, than their underlying assumptions

These projections most typically exclude revolutions, technological and social, of a sort that one can expect in a three-decade span. They presume constant technology and social structure. In addition, in this case the worst alternative seems over-optimistic. To start with, it presumes that the present obstacles to growth will remain roughly the same — incremental capital output ratios will rise slightly, by 10 per cent, and only after 1986, and marginal propensity to save will rise and stabilise at 13-14 per cent. The population growth rate will actually decline. One disappointing feature of the study is that ORG which runs one of the country's best market surveys was unable to draw on that body of data to get some sense of the likely direction of change in consumption and living patterns and relied instead on the National Sample Survey

In any case, despite the shortcomings, this is an essential book for those interested in charting India's future, alternative possible paths.

FERA: Appearance and Reality

Sudip Chaudhuri

A wide gap between the declared objectives of legislation and the actual results is nothing new in India. But what is distinctive about the Foreign Exchange Regulation Act (FERA) is that foreign companies are gaining through faithful implementation of the provisions of the Act. Violation of the Act's provisions, by taking advantage of loopholes or otherwise, has not been necessary.

This paper discusses the background, the declared objectives and the legal provisions of FERA, the guidelines announced for administering section 29 of the Act, the problems of implementation and the impact of FERA on the operation of the foreign corporate sector in India.

The discussion leads to the following conclusions:

(i) No inbuilt legal bias against foreign capital has been introduced through FERA. A section of the foreign corporate sector has in fact been excluded from the purview of the Act.

(ii) The hold of foreign firms over the corporate sector will be strengthened as a result of the implementation of FERA. Indian portfolio investors who participate in the share capital of foreign companies may benefit, but the benefit is likely to be limited, if the foreign firms now declare less dividends and repatriate a higher proportion of profits through other means such as, for instance, transfer pricing.

(iii) The foreign exchange outflow resulting from expansion of foreign companies is likely to increase.

AMERICAN transnational corporations (TNCs) Coca-Cola and IBM, both the largest in the world in their fields, have been asked by the Reserve Bank of India (RBI) to stop their operations in India for failing to comply with the provisions of the Foreign Exchange Regulation Act, 1973 (FERA). Fifty-two other firms are also in the process of winding up their operations in India.[1] The Union Law Minister has ruled out the possibility of any change in FERA and has emphasised the need for "self-reliance rather than inviting big foreign capital and allowing them to exploit the country".[2] Other ministers also have declared that the government is determined to implement FERA, pointing out that they are against any liberal policy towards foreign capital. But is FERA really restrictive? Is it going to hurt the foreign corporate sector as a whole in India? We shall try to analyse these questions in the present paper. In Section I we shall discuss the background and the declared objectives of the Act, and in Section II the legal provisions. Section III shall be devoted to the guidelines announced for administering section 29 of the Act. In section IV we shall be concerned with the problems of implementation of FERA and the factors explaining delay in implementation. In Section V we shall discuss the impact of FERA on the corporate sector. The emphasis here will be on whether foreign capital as a whole is being adversely affected or not.

I

Objectives of FERA

The preamble to the Act describes it as "An Act to consolidate and amend the law regulating certain payments, dealing in foreign exchange and securities, transactions indirectly affecting foreign exchange and the import and export of currency and bullion, for the conservation of the foreign exchange resources of the country and the proper utilisation thereof in the interests of the economic development of the country".[3] This gives the impression that in regard to foreign companies[4] the objective of FERA is not as such their regulation but the conservation of foreign exchange and its proper utilisation. Of course, the operation of the foreign companies has its impact on the foreign exchange situation, but the regulatory aspect is much wider in scope. The Union Finance Minister recently announced[5] that foreign companies may be allowed to retain a higher proportion of foreign equity provided they agree to use for investment purposes in India their earnings which otherwise would have been remitted abroad. This policy is consistent with the objective of conservation of foreign exchange but not with that of regulation of foreign capital.

Though not specifically mentioned in the preamble, it appears that the regulation of foreign capital is one of the major objectives of FERA. The official representatives of the Ministry of Finance, which is responsible for the formulation of the Act, pointed out while giving evidence before the Joint Parliamentary Committee on the Foreign Exchange Regulation Bill[6] that it was found necessary to replace the previous Foreign Exchange Regulation Act, 1947 by the new one, in order to deal effectively with the following three aspects:

(i) regulation of foreign capital in India,

(ii) regulation of employment of foreigners in India, and

(iii) making enforcement of provisions regarding foreign exchange leakages more rigorous.

Our interest in FERA in this paper is restricted to the first aspect. We shall be concerned with only those provisions of FERA and their implementation and impact which are related to the regulation of foreign capital.

The foreign corporate sector in India consists of:

(i) branches of companies incorporated abroad; and

(ii) companies incorporated in India (rupee companies), but controlled by foreigners.

Only the first group, however, is statutorily recognised. The definition of for-

...eign company under Companies Act, 1956 is simply that of a company incorporated outside India, but having a place of business in India.[7] Both in terms of the present size and the trend of growth, the second group is more important, but its existence as foreign controlled is not recognised in the Companies Act, 1956 or in the other Acts, like Monopolies and Restrictive Trade Practices Act, 1969 (MRTP). The RBI has defined a category — foreign controlled rupee company (FCRC) — which it uses in its studies on company finance, on international investment position, etc. FCRCs are Indian joint stock companies (i) which are subsidiaries of foreign companies; (ii) in which 40 per cent or more of share capital is held outside in any one country; (iii) in which 25 per cent or more of the share capital is held by a foreign company/its nominees; and (iv) which are managed by a foreign controlled managing agency company.[8] This category however does not have any statutory backing. In fact the concept is not at all used in the context of industrial licensing under the Industries (Development and Regulation) Act, 1951 [I (D and R) Act]. As one of the representatives of the Ministry of Finance pointed out, "any industrial activity is guided by that Act and there is no separate enactment which enables us to say to a concern with foreign equity 'you cannot do this'. So we thought this lacuna should be filled up."[9] Further, regarding branches of foreign companies no permission is required under the present law to establish a place of business in India, though after its establishment certain requirements (e g, submitting the names of the directors and the secretary, names and addresses of the authorised representatives, etc) have to be satisfied.[10] All these deficiencies are supposed to be removed through the enactment of FERA. To make a distinction between the Indian companies and the foreign companies, so that the latter may be separately regulated, appears to be a major declared objective of FERA.

In practice, of course, special conditions were at times imposed on the foreign companies. While granting licences under I(D and R) Act, or permission under MRTP, the government often asked the foreign companies to dilute foreign equity. It can also be questioned to what extent the failure to control and regulate foreign companies can be attributed to the lack of appropriate legislation. But this is a separate matter. Our main interest in this paper is to analyse whether the declared objective of regulation of foreign companies is being realised through the implementation of FERA.

II

Legal Provisions

For our purpose only section 29 — out of a total of 81 sections — is relevant. Under section 29 of FERA, all non-banking foreign branch companies and rupee companies[11] with foreign equity more than 40 per cent require the permission of the RBI to (a) carry on (b) establish (c) purchase shares of and (d) acquire wholly or partly any undertaking engaged in activities whether of trading, commercial or industrial nature.[12] Companies already existing at the time of commencement of the Act (i e, January 1, 1974) are required to apply to the RBI for permission to continue their business within six months (or as specified by the RBI). The RBI "may after making such inquiry as it may deem fit either allow the application subject to such conditions, if any, as the Reserve Bank may think fit to impose or reject the application".[13] If no permission is given or if no application is made, then the company concerned will have to close down within a specified period. It is important to note that section 29 of FERA is as such not prohibitive. It only requires permission to be obtained. What is more important is the basis on which the decision regarding the acceptance or the rejection of the application is to be taken. This is provided by the guidelines for administering section 29, announced by the government in December 1973 and later modified in April 1976. This is purely an executive action and lies outside the purview of the Act. To give an example, if the guidelines are such that all the companies are allowed to operate in any field without any restrictions whatsoever, then this will amount to total freedom for foreign capital will still be perfectly consistent with the implementation of FERA. No inbuilt legal bias against foreign capital has been introduced. There is ample scope for administrative manoeuvrability. If anything, what FERA does is to exempt a part of the foreign corporate sector from the regulations. Rupee companies with less than 40 per cent foreign equity may be foreign controlled but they lie outside the purview of the Act. More about this later.

III

Guidelines for Administering Section 29 of FERA

The guidelines[14] are essentially that foreign branch companies will have to register themselves in India with foreign equity not more than 40 per cent and rupee companies with more than 40 per cent foreign equity will have to reduce it to 40 per cent or below. This holds for all companies whether engaged in industrial, trading or other activities like consultancy, construction, etc. Foreign airlines and shipping companies will be treated on a reciprocity basis and hence for the present will be allowed to operate as before. Under certain conditions exemptions will be given. Industrial companies will be allowed to hold foreign equity upto 74 per cent if they are engaged in

(i) the core sector, i e, the production of items specified in Appendix I of Industrial Licensing Policy, February 1973. These are items classified under 19 product groups and include such products as steel castings and forgings, equipment for transmission and distribution of electricity, agricultural machinery, inorganic fertilisers, manmade fibres, drugs and pharmaceuticals, portland cement, etc;

(ii) predominantly export oriented industries (i e, minimum exports 60 per cent of total turnover);

(iii) manufacturing activities which need "sophisticated technology"; or

(iv) a combination of the above three such that the combined activities account for not less than 75 per cent of the total turnover.

Foreign equity upto 51 per cent will be allowed if

(i) the combined activities account for not less than 60 per cent of total turnover; or

(ii) exports account for not less than 40 per cent of total turnover.

Companies engaged in trading and other activities like consultancy and construction may be allowed to hold foreign equity upto a maximum of 74 per cent if they have developed skills or technology not readily available indigenously. In trading, however, no fresh foreign equity participation will be allowed. Tea will be considered

just like any other product in Appendix I and hence tea companies will be entitled to hold foreign equity upto 74 per cent. Manufacturing and trading companies who presently do not qualify to hold more than 40 per cent foreign equity may be given exemptions if they change their character from the present activities to predominantly manufacturing activities — producing an item in Appendix I or exporting more than 60 per cent of the total turnover. The entire product group "drugs and pharmaceuticals" is included in Appendix I. But for the purposes of FERA, only drug intermediates manufactured from the basic stages for the production of high technology bulk drugs will be so considered. In fact, for drug companies, the government in its new drug policy, has announced a two-tier equity dilution formula. The degree of dilution will vary inversely with the quantum of sophisticated technology used.[15]

The Janata government's industrial policy stated that "after the process of dilution under this Act [FERA] has been completed, companies with direct non-resident investment not exceeding 40 per cent will be treated on par with Indian companies, except in cases specifically notified, and their future expansion will be guided by the same principles as those applicable to Indian companies".[16] What is apparently restrictive about FERA is that foreign companies will have to pay the cost of diluting foreign equity to 40 per cent to be eligible for the benefits of obtaining equal treatment with Indian companies and facing no additional impediments on their growth. Alternatively, they will have to pay the cost of restricting their activities to specific areas, as mentioned above. But does this reflect the real content of the guidelines? Before turning to this question let us briefly discuss the nature of implementation of FERA.

IV

Tardy Implementation of FERA

The FERA came into force on January, 1, 1974. As required under the Act, 881 foreign branch and rupee companies applied to RBI for permission to continue their business in India. RBI's Annual Report, 1977-78, states that 814 cases have already been disposed of. In 321 cases it was not necessary to take permission from RBI or to dilute foreign equity; 66 companies already had foreign equity at the required levels; 343 companies have been directed to dilute foreign equity to 74 per cent, 51 per cent or 40 per cent, depending on the nature of activities of the companies. Fifty-four companies are winding up their operation in India. Applications from 30 companies were rejected either because they were dormant for several years or because continuance of foreign investment in those activities was considered undesirable. Later, a minister while replying to a question in Parliament pointed out on November 27, 1978 that 350 companies have been directed to dilute foreign eqity — 236 companies to 40 per cent and 114 to 74 per cent or 51 per cent. Of these, 227 companies have already complied with the direction — 159 companies diluting to 40 per cent and 68 to 74 per cent or 51 per cent.[17]

Thus even after five years of operation, about 60 cases are yet to be disposed of, including 33 drug firms, and 123 companies are yet to dilute to the desired levels. Initial performance was much worse and it is only recently that implementation has been expedited. After receiving the applications, the RBI invited proposals for equity dilution from August 1975 onwards. After scrutinising these, the RBI from April 1976 onwards started granting permission subject to conditions as specified in the guidelines. Usually two years' time was given to the companies to take appropriate action. A FERA committee consisting of the secretaries of five government departments — *viz*, economic affairs, industrial development, commerce, science and technology and company affairs — was also set up to advise the RBI whenever required. The processing of the applications, scrutinising the proposals and referring cases to the FERA committee took an unusually long time. A company, for instance, complained that even after three years of submission of its proposals, RBI had failed to take any decision.[18] Initially it appears that RBI was not concerned about the speedy implementation of FERA. It has been reported that sterling tea companies[19] have been told at the highest levels in RBI that there was no particular urgency to comply with the FERA time limit.[20] The government of India also perhaps did not expect quick implementation. T A Pai, the then Minister of Industry, felt worried that if all foreign companies are told to accept Indian equity, then enough finance may not be left for Indian companies.[21] RBI failed to take appropriate action promptly, especially in cases where large TNCs were involved. Even in cases without any ambiguity regarding the steps to be taken, RBI has a tendency to follow a 'wait and see' policy and does not send the final order unless specifically instructed by higher political authorities. IBM is an important case in point. Its initial proposal was submitted in June 1974 and a modified version in April 1976 after prolonged discussions. In September 1976 the FERA committee took the decision not to allow IBM any exemption regarding equity dilution. The company, however, backed by powerful lobbies continued to discuss various other proposals with the government, and it was not till September 1977 that the final decision was taken and that too following a categorical directive from the Prime Minister.[22]

The treatment of income tax dues of the sterling tea companies has delayed their rupeeisation plans. The tea companies used to remit certain amounts to their London based secretaries and agents, as general administrative and management expenses. These being considered as expenses related to their business in India, were tax free. The British Price Commission, however, came out with the startling fact that very little of such secretarial services were in fact provided by their London agents.[23] It follows that the remittances were in fact profits in disguise. Since then the Income Tax department has served notices for assessment of tax dues, including penalties, on such remittances over the last 16 years (the maximum permissible under Income Tax laws). Initially the companies demurred, but later cooled down and started negotiations with the Income Tax authorities for arriving at a compromise settlement.[24] However, the government failed to act promptly and a final decision regarding the nature of assessment is yet to be taken. The sterling companies, in order to comply with FERA, are floating new companies in India and transferring the assets of the sterling companies to the former against payment in the form of equity shares. Naturally, therefore, delay over the settlement of tax liabilities is holding up the rupeeisation plans. Again, with the recent boom in the tea industry, it has become the object of much negotiations and attempts are being made to have behind-the-scene deals. The Indian agents of the sterling companies, for instance, are lobbying to hold 26

Table 1 : FERA Companies which Have Diluted Foreign Equity through Public Issue of Shares

	Name of Company	Fresh Issue of Shares to Indians (Rs lakhs)	Offer for Sale of Shares by Parent Firms (Disinvestment) (Rs lakhs)	Percentage of Foreign Equity before Dilution	Percentage of Foreign Equity after Dilution	Cost of Projects (Rs lakhs)	Total Assets at the time of Expansion (Rs lakhs)	Col (6) as Per Cent of Col (7)

(1) Includes Rs 35.46 lakhs shares sold to the parent company
(2) If indirect foreign holdings are included, then the percentage of foreign equity will be 43.32 per cent.
(3) Convertible bonds at 10.5 per cent, convertible into equity shares on March, 31 1981.

Note : The above list is not exhaustive.

per cent of the shares of the new rupee tea companies. Though the government has announced that, in principle, it is against such deals, at least one Indian agent, Macneil and Magor, has been permitted to hold block shares.[25] Shaw Wallace also may get block shares in the Assam Frontier Tea Co.[26] It has also been reported that London offices of the tea companies are receiving take-over bids from influential Indian interest.

The dominant factor explaining the slow implementation appears to be the poor response of the companies. They indulged in various types of dilatory tactics to derive maximum benefits in the situation arising out of FERA. Very often the companies violated the RBI directives. Thus in July 1976, the RBI asked the companies to submit their dilution plans within three months; but few responded.[27] More than 100 foreign companies did not dilute their foreign equity within the two-year period provided by RBI for the purpose.[28] Of course all these could not have been done without the tacit approval of influential interests. Though legally empowered to take action, RBI

TABLE 2 : NATURE OF FINANCING OF EXPANSION PROJECTS OF 227 FERA COMPANIES

		(Rs Crores)
(A)	Cost of projects	143.45
(B)	Nature of financing	
	Additional Indian share capital	34.52 (24.1)
	Additional foreign share capital	0.35 (0.2)
	Domestic loans	68.22 (47.6)
	Foreign loans	0.65 (0.5)
	Internal cash accruals	33.60 (23.4)
	Central government subsidy	0.60 (0.4)
	State government interest free loans	5.51 (3.8)

hardly resorted to this. Moreover it extended on a yearly basis, the permission for loans and overdraft facilities provided by the banks to the FERA companies though this could have been used as an indirect pressure. Of course, RBI has directed foreign companies to stop accepting public funds pending a decision on their future. But here too relaxations have been made. Glaxo, for instance, was allowed to accept public deposits though it is yet to satisfy the FERA requirements. Lately, RBI has threatened that profit remittances will be suspended unless the companies follow the directives regarding FERA.

Regarding pharmaceutical firms an expert committee was set up to ascertain the nature of technology used. The firms, however, refused to answer the questionnaire sent by the committee. The pharmaceutical firms, it is reported, have told the government that the exact nature of the technology used cannot be revealed because of the secrecy clause in the collaboration agreements. Further, in their view all technologies used for producing bulk drugs are sophisticated.[29] The deadlock is yet to be resolved.

V

Impact of FERA

Our emphasis here shall be on two inter-related aspects:

(i) whether the stranglehold of foreign capital over the corporate sector is likely to be reduced; and

(ii) whether the outflow of foreign exchange due to the activities of the foreign companies is likely to fall.

Very little systematic data are available regarding FERA. In fact, till very recently not even the number of companies complying with the provisions of FERA was publicly known. Till now about 227 companies have diluted foreign equity. But not all have approached the capital market. Some are diluting their foreign equity by privately allotting shares to Indian employees, Indian shareholders, financial institutions, etc. We could not obtain the list of these companies. But it appears that the smaller companies are being permitted to dilute foreign equity in this manner, the larger and the more important ones usually being asked to go for public issue of shares. For information we have essentially relied on the prospectuses of companies which have already issued shares to the public. Hence the analysis that follows should be considered to be applicable to the larger foreign companies. But this may give a fairly good idea about the overall impact because the distribution of assets between different sizes of firms is highly skewed. The largest 50 subsidiaries, for instance, account for more than 80 per cent of the total assets of all subsidiaries.[30]

Our sample consists of 68 companies.[31] Some however are yet to totally fulfil the FERA requirements and thus will have to dilute foreign equity again to the lower prescribed levels. One notable feature of FERA is that, separate rupee companies are being formed to take over the different companies belonging to the same business group. Thus Warren Tea was incorporated recently to take over 11 tea companies, Mcleod Russel 7 companies, and Lipton Tea 5 companies. Assets of one sterling company were transferred to India Foils. The entire undertaking of Beecham (India) was vested in Hindusthan Milkfood Manufacturers. Out of 68 companies in our sample, therefore, only 46 exist at present (see Table 1).

Indianisation

The process of diluting foreign equity is being referred to as 'Indianisation' of the foreign companies. The idea is that since the percentage of foreign share holding is going below 50 and Indians are holding the majority shares, control is passing to them. This would have been the result if there were only a few shareholders, each interested in the management of the company. But when a company has a large number of shareholders, the controlling block need not be more than 50 per cent or even 40 per cent of the total equity. Without going into details, let us point out that the small investor normally considers his equity holdings as portfolio investment and is interested only in the return. He does not take the trouble of attending annual general meetings and even when he does, he does not have much say. He usually supports the present management through proxies. Mobilisation of scattered shareholders for the purpose of defeating the present management is considered to be a tremendous task and in all probability is likely to fail even in cases of mismanagement. There is practically no threat to the present management unless someone else holds a large block of shares, i e, if other shares are not widely dispersed. The Industrial Licensing Policy Inquiry Committee (Dutt Committee) found that much less than even one-fourth of the equity was adequate to exercise control. Thus Birla controlled India Steamship Co, having 11,320 shareholders, with 5 per cent of total equity. Tata controlled Tisco, having 10,222 shareholders, with only 6 per cent. Walchand controlled Premier Automobiles with only 9 per cent of total equity. Many such examples can be given.[32]

The way FERA is being implemented, practically ensures wide dispersal of shares of the companies. The government directives have contributed a lot to this. Except in cases where there is little market demand for shares, the companies have been asked to approach the shares market for public issue of shares. In the case of over-subscription of shares, the stock exchanges have been directed to allot shares in such a manner that small investors are preferred. Initially the ceiling was fixed at Rs 5,000 value of shares per individual. Now, the ceiling has been reduced to Rs 2,500. Announcement of public issue of shares by FERA companies is being accompanied by tremendous en-

Table 3 : Extent of Increase of Manufacturing Capacities of Some FERA Companies

Source : Prospectuses of companies.

thusiasm on the part of investors to subscribe to such shares. Shares of most of the companies are being over-subscribed several times. The shares of Mcleod Russel, for instance, have been oversubscribed 41 times, those of Warren Tea 27 times, Cadbury India 16 times, Britannia Biscuits 20 times. Hindusthan Lever received applications for a record number of 30,874,725 shares. This is perhaps one of the few occasions where FERA companies are following government orders in toto. No wonder that they are ending up with a large number of shareholders. Hindusthan Lever, for instance, ended up with 95,000 shareholders, the largest in any joint stock company in India. This is of course an extreme case but others are also having their shares widely dispersed. Britannia Biscuits has about 27,000 shareholders, India Foils more than 7,500.

The possibility of benami shareholding and clandestine cornering of shares is of course there. But the fact that the companies concerned are themselves allocating the shares in consultation with the stock exchanges, reduces the chances. Indeed a representative of the Bengal Chamber of Commerce and Industry, Calcutta (an organisation where foreign companies are represented to a large extent) said in his evidence before the Joint Parliamentary Committee on the Foreign Exchange Regulation Bill that 40 per cent is an arbitrary percentage for determining foreign control and will not necessarily lead to further Indianisation of foreign companies. Ironically enough even RBI, which has been entrusted with the task of implementing FERA, considers, as we have already noted, a company to be foreign-controlled if 25 per cent or more of the shares are held by a foreign company.

Further, in the Articles of Association of some of the FERA companies, the right of the parent companies to appoint or remove the top management has been explicitly mentioned. Some instances may be cited. Unless the equity share holding by Unilever, UK, in Lipton Tea (India) is less than 26 per cent and that of Warren Plantations, Holdings, UK, in Warren Tea is less than 40 per cent, the parent companies shall have the right to appoint or remove te managing director in the rupee companies. So long as Chesebrough-Pond, USA, is a member of Pond's (India) it can appoint or remove one third of the total number of directors, including the managing director(s). CPC International too is empowered to appoint or remove the chairman, the vice-chairman and the managing director of Corn Products Company (India).

Investment through fully-owned subsidiaries or branches is no longer the dominant pattern. For quite some time now there has been a growing tendency of accepting local equity. Foreign branch investment is decreasing not only relatively but also absolutely.[34] Further the number of Indian subsidiaries of foreign firms (i e, rupee companies where foreign equity is more than 50 per cent has been steadily decreasing over the years. From 243 around 1968 it went down to 197 around 1970 and to 188 at the time of enactment of FERA.[35] So, long before FERA came into force, many foreign companies had issued shares to the Indian public, thereby diluting foreign equity. Obviously foreign firms would not have done this if no additional benefits were to be obtained.

Some general factors which may explain the increasing trend of accepting local equity are:

(i) Need for local intermediaries: smooth functioning of many foreign companies requires interaction with Indians at different levels. They have to deal with government officials for industrial licences and import licences, with financial institutions and banks for finance, etc. Foreign companies realised the need for local intermediaries having vital contacts and capable of performing these functions efficiently. One way of securing such services has been to allot some shares to the local intermediaries and appoint a few of them on the board of directors, while keeping the overall control in foreign hands.[36]

(ii) Need for local portfolio owners: the foreign firms are usually criticised from nationalistic angles. Anticipating or responding to this, they have often adopted local owners to create the impression that the firm is a sort of a joint venture, operating in the interest of both, though in effect the Indian interests are totally subservient to the foreign controlling interests. Further, the returns from such portfolio investment may prompt the Indian parties to oppose moves which try to hurt the firm.

(iii) Government policy: For quite some time now the government has adopted the policy of asking the foreign companies to dilute their foreign equity as a condition for granting industrial licences. This is an important factor explaining increasing Indian equity participation in foreign companies.

Expansion of FERA Companies

Responding to the provision of FERA regarding foreign equity dilution, the

foreign firms are not passively disinvesting their shares. They are utilising the opportunities and are enthusiastically implementing expansion schemes. Previously, often, they used to dilute foreign equity in order to obtain licences for expansion, now they are expanding as part of the process of foreign equity dilution.

Three options were open to the foreign companies who were required to dilute their foreign equity:

(i) diluting foreign equity by issuing additional shares to Indians, the absolute foreign share holding remaining the same (or even increasing);
(ii) diluting foreign equity through disinvestment, i e, selling the existing shares to Indians so that the total amount of shares remains the same; or
(iii) merging the company with an Indian company so that foreign equity in the new company comes down to the prescribed percentage.

Only a few companies have adopted the second and third methods. Issue of additional shares to Indians has turned out to be the most popular way of diluting foreign equity. Thus in only seven out of the 46 companies being studied has foreign equity been diluted solely through disinvestment. In four other cases, a part of the foreign shares has been disinvested, but simultaneously fresh shares have been issued so that the total share capital has increased (see Table 1). The implication is significant. The very process of equity dilution is generating additional funds for expansion. The government on its part is liberally granting licences for the purpose, as we shall soon discuss.

Out of the 46 companies, 27 have specific expansion proposals. All these companies have pointed out in the prospectuses that the object of public issue is two fold (i) to dilute foreign equity as required under FERA, and (ii) obtain funds for financing at least a part of the expansion projects. Twelve companies have pointed out that the money so obtained will be utilised for the working capital or general business requirements. The remaining seven, as we have already noted, have disinvested a part of foreign shares. But the fact that schemes for expansion have not been mentioned in the prospectuses does not necessarily mean that they are not expanding. It is probable that they are also planning expansion programmes which may take final shape in the near future, Horlicks of UK, for instance, have reduced their shares in Hindusthan Milkfood Manufacturers to 40 per cent through disinvestment, but the latter is in the process of expanding its capacity.[37] The case of Remington Rand is indeed exceptional. Sperry Rand of USA, the parent company has disinvested its entire share, the primary reason being that it has decided to discontinue its conventional office equipment business.

The cost of projects of the 27 companies amounts to about Rs 143 crores. Out of them, for 20 companies, the costs (ie, Rs 121 crores) constitute roughly 37 per cent of the total assets of these companies at the time of expansion. It is also interesting to analyse the nature of financing of these projects as shown in Table 2. The size of expansion has not been restricted by the availability of additional share capital. In fact about 24 per cent came from this source. They also approached the financial institutions, banks and state industrial development corporations for additional finance and other facilities. They are also taking advantage of the provisions of Central government subsidies and state government interest-free loans offered to specific types of projects. Hardly any foreign resources are being used for the purpose. Roughly 76 per cent comes from domestic sources external to the firm (i e, domestic loans, additional Indian share capital, government subsidies), 23 per cent from domestic sources internal to the firm (i e, internal cash accruals) and less than one per cent from foreign sources.

The aggregate figures discussed above may conceal the relative importance of the expansion of some firms already exercising significant economic power over the corporate sector. It may also obscure the impact on product concentration.

Hindusthan Lever, which already has eight factories (excluding 12 small units for producing animal feeds) in different parts of the country producing such diverse items as toilet preparations, chemicals, vanaspati, milk powder, etc, with sales of more than Rs 261 crores (in 1976-77), is simultaneously implementing four projects to produce synthetic detergents, STPP, a raw material for synthetic detergents, ossein/di-calcium phosphate and fine chemicals. The cost is estimated to be Rs 27 crores. Through its public issue in November, 1977, the company has reduced the foreign equity from 85 per cent to 65 per cent. RBI initially directed it to reduce foreign equity to 40 per cent. But the company's plea that it is employing 'sophisticated technology' and thus eligible for holding foreign equity upto 51 per cent, appears to have received favourable response from the government, though a final decision is yet to be taken.[38] In any case in the near future it may again approach the share market for diluting foreign equity to 51 per cent (or 40 per cent) and thus may get the opportunity of further expansion.

WIMCO, another TNC operating in India, which has already diluted foreign equity to less than 40 per cent is undertaking modernisation and expansion programmes covering five years till 1980 at a cost of about Rs 21 crores. This will increase total assets by more than 90 per cent. The items of production involved include glue, semi-chemical pulp, paper and paper board, canned and minced meat, bromine and bromides, etc. It is also making arrangements for raising plantations for the supply of good quality timber. Metal Box is diversifying into bearings production at a cost of Rs 19.7 crores. Tinplate Co is adopting new processes of production and expanding its capacity of tinplate/tinfree steel at a cost of about Rs 21 crores, which constitutes about 85 per cent of the total assets. Tribeni Tissues, KSB Pumps, Ennore Foundries, Davy Ashmore anl Asea are among the other firms expanding in a big way, the costs of new projects as a percentage of total assets ranging between 50 and 130 (see Table 3).

The impact on project concentration is also likely to be significant.[39] All the prospectuses do not give adequate data on the expansion of capacities of individual items. Data given in Table 3 is all that could be obtained from the prospectuses. The Table is self explanatory. Suffice it to say that the percentage increase of manufacturing capacities is quite large, ranging from 25 per cent to 900 per cent. Product concentration, therefore, can be expected to increase in a significant way.

What is worse is that as part of their plans for equity dilution, the government is permitting the TNCs to encroach upon areas where the small units can produce without the help of any foreign technology. It is anticipated that many small units may close down. The establishment and growth

of a large number of others may also be adversely affected. Thus in the name of FERA, a sort of deindustrialisation is being carried out just to make more room for foreign capital. We shall discuss some instances.

While agreeing to reduce foreign equity from 100 per cent to 40 per cent, Colgate Palmolive has obtained or is expected to obtain industrial licences to produce a large number of low investment, soft technology items like menthol, sorbitol (an ingredient for making general tonic), sports goods, special toilet articles, modern cosmetics, etc,[40] though these have not been mentioned in the prospectus. The impact is likely to be the displacement of a large number of small scale producers. Take menthol as an example. There are 200 small units engaged in its manufacture, the total number employed being 35,000. The small units have pointed that Colgate Palmolive (with a licence to produce 100 tonnes) together with another large unit (which has been recently granted a licence) will be in a position to meet the entire domestic demand, thus forcing them to close down.[41]

Cadbury India currently engaged in the production of malted foods and other processed foods like chocolates is arranging for diversification into Cocoa butter substitute, marine processed foods, apple juice concentrate and expansion of capacity for malt extract. Britannia is also planning to set up a soyabean complex to produce a variety of 'high protein foods'. Production of such food products by TNCs is often defended on the ground that they are necessary for the health of the people. But there is evidence[42] to suggest that not all food products marketed by MNCs in the poor countries are safe for health. It is the high pressure sales technique rather than the inherent qualities of the products which usually makes them successful in the market.

In the government's view, of course, the influence of foreign capital is not increasing, because a company with 40 per cent or less foreign equity will be considered just like any other fully Indian company. Government, in fact, is defining away the problem of foreign capital. Its control is supposed to be reduced by the magic rule of dilution of foreign equity to 40 per cent. Sometime back, George Fernandes, the Minister of Industries announced[43] that he had asked Hindusthan Lever and WIMCO to stop the production of soaps and matches, respectively, after three years. He also gave an idea about the favourable impact of such a move; 70 per cent of the production of matches comes from cottage industries employing about 4.5 lakhs of people and 30 per cent is produced by WIMCO employing only 15,000 people. Naturally, therefore, the proposed action will have a large impact on the employment situation. The minister, however, later pointed out in the Lok Sabha that the government was only having discussions with the foreign multinational companies to persuade them to get out of consumer goods industries. The implication is that WIMCO will not be affected, because as the company pointed out in this context in its annual report (1977), it no longer can be considered to be a "foreign multinational company" as its foreign equity is below 40 per cent.

Impact on Foreign Exchange Situation

Even before FERA, the government has been insisting on equity dilution on the ground that outflow of foreign exchange will be less. It is our contention that the outflow of foreign exchange is not likely to decrease as a result of the implementation of FERA because of the following reasons:

(i) As we have already discussed, the dominant pattern has been to dilute foreign equity by issuing additional shares to Indians rather than selling existing foreign shares to them. This implies that though the percentage of foreign capital falls, the absolute amount remains the same. In fact, a lower percentage is consistant with a higher absolute amount. Perfect Circle Victor Co, for instance, reduced its foreign equity in April 1976 from 55 per cent to 38.8 per cent through public issue of shares including additional sales to foreigners. Dividend remittances depend on the rate of dividends and the absolute value of foreign share capital. The latter remaining more or less constant, dividend remittances will decrease only if the rate of dividend falls. But this again, is highly unlikely, particularly when the foreign companies are being allowed to expand in diverse fields including low investment, highly profitable areas of simple consumer goods. Even if the result is lesser dividend remittances, the outflow of foreign exchange may not be reduced, as we shall now discuss.

(ii) In the case of TNCs, declared profit is not usually a true indication of the effective or actual profit, nor is dividend remittance the only way through which foreign exchange outflow takes place. A large volume of transactions usually takes place between the subsidiaries of the same TNC spread over different countries. One of their favourite practices is to manipulate the prices of such sales. The materials imported by a subsidiary, in India, eg, may be overpriced to inflate the costs and thus show a lower amount of declared profit in India. This may be done for a variety of reasons, the important ones being (a) to increase the global after-tax profit — what is lost by the Indian subsidiary through overpricing is gained by another subsidiary of the same group; but if the rates of taxes are different, the total profits will increase; (b) to contain the adverse public reaction to high declared profits, specially in third world countries; and (c) to bypass the foreign exchange control measures that might be in force restricting dividend or royalty remittances.

Overpricing is generally considered to be the principal form of earning profits by TNCs. For the pharmaceutical industry in Colombia, Vaitsos,[44] for instance has found the extent of overpricing by TNCs to be 155 per cent. He has calculated that 82.6 per cent of the effective profitability comes from overpricing, 14 per cent from royalties and only 3.4 per cent from declared profits. Studies for other countries and for other industries confirm this practice. Such thorough work for India is yet to be done. But on *a priori* grounds, there is no reason to expect the operation of TNCs in India to be different in this regard, particularly so because they operate in a structure and within regulations (or the absence of them) not much dissimilar. Isolated findings, in fact, confirm the practice of overpricing. Subramaniam and Pillai,[45] for instance, have found the extent of overpricing in the case of six materials required for the manufacture of dye stuff, to be quite high — ranging from 124 per cent to 347 per cent. Thus since the TNCs have the power and the opportunity to earn profits in different forms, what it loses on account of lesser amount of dividend remittances may be made up by relying more on alternative sources, thereby frustrating the attempts to conserve foreign exchange by preventing dividend remittances. The necessary condition of regulating the foreign exchange outflow through TNCs is to control them and this is precisely the element which we find missing in FERA.

(iii) A number of expansion projects are being implemented through new technical collaboration arrange

ments. Royalty payments and other technical fees will, therefore, increase. Moreover, the import bill is likely to increase not only through increased imports of fixed capital during the construction phase, but also increased imports of raw materials and intermediates when the projects become operational and a larger volume is produced. Hence, even in the absence of overpricing outflow of foreign exchange is expected to be significant.

Implications of Exemptions

So long we have discussed how through the process of equity dilution, the foreign companies are expanding and the impact of this on foreign control and the foreign exchange situation. But *many foreign* companies are not even required to dilute their foreign equity to 40 per cent. Exemptions in the form of higher foreign equity upto a maximum of 51 per cent, 74 per cent or even more will be allowed to companies which are engaged in the following areas or those which are willing to change their present character in favour of these:

- (a) core sector,
- (b) export oriented,
- (c) production requiring sophisticated technology.

The rationale of the presumption appears to be that production in such areas deserves priority attention, it being necessary or important from the point of view of the economic development of the country, that without foreign investment production in these areas will be hampered and that without the exemptions regarding equity dilution, foreign investment here may not be forthcoming. But is this valid? We now turn to this question. The doubt that the real motive of FERA was not at all the regulation and prevention of foreign capital is strengthened if we examine the nature of these exemptions closely.

Take the items specified in the Appendix to the Industrial Policy, February 1973. These are items of "basic, critical and strategic importance for the growth of the economy"[47] and are usually referred to as constituting the core sector. Whether all the items are of such importance is a pertinent question. But even if we assume that production of all is necessary, should foreign investment be allowed on an increasing scale? It is not that investment in the core sector by the foreign companies is less profitable or that they will not produce in the absence of special incentives. Neither is it the case that Indian firms cannot or do not produce most of these items. Consider the period before FERA.

A detailed classification of the industrial activity of all the foreign companies to find out the share of core sector in total investment is not available. But by restricting ourselves only to the foreign companies with more than 50 per cent foreign equity we have calculated that more than 55 per cent of their total assets are engaged in the core sector.[48] Further, a large number of the core sector products can easily be manufactured without the help of foreign firms. The government for some time now has started the policy of announcing illustrative lists of products where foreign capital and/or foreign technology are not required.[49] We could identify 65 items (*including 29 items in the industrial* machinery group and 23 items in the paper, pulp and allied industries) of the core sector where the government does not consider any collaboration (financial or technical) as necessary. In 32 other items no financial collaboration is considered necessary. These are the items where the government itself considers foreign capital unnecessary. But items which Indian firms with no *financial collaboration* are producing can also be considered to be areas where foreign capital is not necessary. This is because the foreign companies also essentially rely on domestic resources and there is no evidence to suggest that they can do it more efficiently. Higher profitability should not be considered here as an index of efficiency because profitability depends on a large number of other factors unrelated to efficiency; for instance, xenophilia.

Data regarding the lists of producing units and the nature of collaboration (if there are any) are provided for a sample of products in the DGTD publication, "Handbook of Industrial Data, 1975". We could identify 67 such products which are in common with the core sector list. Out of this, we could find only three products where all the units have some sort of financial collaboration. For all the rest, units existed which had no collaboration at all or had *only technical* collaboration.

To specify such areas — where not only foreign firms invest on their own without any special incentives but also where Indian firms are involved on a large scale — for special treatment and exemptions is an indirect way of exposing the economy more to foreign capital. If these products are really of basic, critical and strategic importance to the economy, then there is more reason why foreign investment should be prevented here. Otherwise, their bargaining strengh will increase and they will be in a position to insist and obtain more concessions than they presently enjoy.

Exemptions are also permitted if foreign companies are engaged in the production of items where sophisticated technology is used. Regarding the definition, the guidelines said, "in determining whether a technology is sophisticated or not the Department of Science and Technology will be consulted and consideration will be given *inter alia* to aspects such as (a) whether the technology is used for the manufacture of products which would otherwise necessitate imports, (b) whether the discontinuance of the *manufacture of products with the technology* would have adverse impact on the economy, etc". The second part of the definition is vague and anything can be justified by suitably defining 'adverse impact'. Regarding the first part, it is important to note that the necessity of imports is not something which is autonomously given; it is very much a part of the structure of production. It depends on how production is organised — the nature of technologies used, the nature of the firms, etc. To apply the criterion in a structure which is dominated by foreign capital is to invite them to expand still more. Many products can be manufactured by alternative technologies, the raw materials differing *not only quantitatively* but *often* qualitatively. The foreign companies which employ foreign technologies usually have a tendency to depend on foreign sources for the supply of raw materials. Hence, to accept foreign capital and technology in certain fields is to make certain imports necessary. In fact one of the common methods of the foreign companies to enlarge their sphere of operation is to obtain initially licence for a particular product and then induce the government to grant further licences to produce other items on the ground that these are necessary for the product. Attempts to produce imported goods on the basis of foreign capital and technology are self-defeating. The technology used being capital-intensive little employment is generated. Hence the growth cannot be sustained for long because of the lack of demand. Moreover, it may not ultimately result in lesser imports as the experience of poor countries shows.

The performance of the TNCs regarding manufactured exports from India has been very poor, these ac-

counting for about 5 per cent of total manufactured exports.[56] It may be claimed that because of this, incentives are necessary to induce the foreign firms to export more. But what are the advantages? The limitations of the export-oriented growth strategy have been widely discussed[57] and we need not reproduce them here. It is enough to point out that if the foreign companies end up exporting more, their hold over the economy will increase, but not necessarily the net foreign exchange earnings, because of their large foreign exchange costs.

The main thrust of our discussion so far has been that FERA is not harmful to the foreign companies. But it may be legitimately asked if it is really so then why is it that a number of foreign companies are winding up? There is little doubt that Coca Cola Export Corporation and IBM World Trade Corporation would have continued their business in the absence of FERA. But these are among the exceptional cases. It has been the corporate policy of IBM to insist on 100 per cent equity in their subsidiaries all over the world, perhaps to make secrecy fool proof in this high technology area. It appears that they did not want to set a bad precedent, particularly when market in India constituted about 0.2 per cent of their total sales in 1974-75.[58] Similarly, given the strategic importance of the formula of the concentrate, Coca Cola was not willing to dilute foreign share holding and run the risk that the formula might be divulged. The complete list of the other FERA companies which are winding up is not available. Most of the 33 companies (for which we could obtain information) are foreign branches engaged in trading and that too marginally. It includes companies like Nestle products and Columbia Gramophone Co, whose winding up does not matter much because they were essentially engaged in the distribution of the products of their sister concerns, and these concerns continue to operate. It is important to stress that firms engaged in the dominant and dynamic sector of manufacturing are not winding up except in a few cases. It appears that given the meagre size of business these trading companies do not find it worth their while to undergo the trouble of floating separate rupee companies. More so, because gains from dividends will be drastically reduced as majority Indian share capital is accepted, the alternative sources of transfer pricing and royalty earnings being absent here.

VI

Conclusion

Recapitulating our discussion, we have arrived at the following conclusions:

(i) No inbuilt legal bias against foreign capital has been introduced. A section of the foreign corporate sector in fact has been excluded from the purview of the Act.

(ii) The stranglehold of the foreign firms over the corporate sector will be strengthened as a result of the implementation of FERA. One of the beneficiaries of this will be Indian portfolio investors who are participating in the share capital of these companies. But the benefits may be limited, if the firms now declare less dividends and earn a higher proportion of actual profits through alternative means, for instance, transfer pricing.

(iii) Foreign exchange outflow resulting from the expansion of the foreign companies is likely to increase.

A gap between the declared objectives of legislation and the actual results is nothing new in India. But what is distinctive about FERA is that the foreign companies are gaining by faithfully implementing the provisions of the Act. Violation of the provisions by taking advantage of the loopholes or otherwise has not been necessary.

39 To find product concentration, the proper thing would have been to compare the percentage of total

production before and after the expansion. This obviously cannot be done because the extent of capacity utilisation cannot be predicted without error. The next best course would have been to compare the percentages of total capacity of the products concerned. This too cannot be done because of lack of data. The latest issue of the Annual Report of DGTD, the usual source for such information, appeared in 1976 giving data for 1974 and 1975. Most of the companies, however, have been expanding after that.

Female Labour in the Unorganised Sector

Profile of a Brick Worker

Leela Gulati

Brick-making is a major cottage industry in Kerala. According to one estimate, not less than 1.20 lakh workers, male and female, are engaged in making hand-moulded bricks in the state. Since no brick kiln employs more than 20 persons at a time, brick-making is considered a cottage industry.

There is rigid compartmentalisation of work on the basis of sex in the brick industry. Women are employed exclusively for carrying head-loads, while all skilled and semi-skilled work, such as moulding, shaping, stacking, etc, is done exclusively by men. As a result, women's wages, for work which is not physically less exhausting than that done by men, are only about half those earned by men. Nevertheless, women cling to the brick industry because of the uncertainty of work opportunities elsewhere and the continuity of employment which brick work offers.

This is the story of a middle-aged, untouchable woman brick-worker, Jayamma, her work and her family.

JAYAMMA is a middle-aged Ezhava[1] brick worker.[2] She has six children, three boys and three girls. All her children are grown up; even her youngest, a boy is about 14 years of age. Among her six children, four are already married and three stay separately in their own homes. Her oldest son stays with his own family, a couple of miles away from where Jayamma lives. But her two married daughters stay near her in the same neighbourhood. So the people now sharing the roof with Jayamma are her 55-year old husband Kannan, her recently married son, Sukumaran and his wife, and her teenage daughter Vanaja and son, Anant.

Jayamma lives in a medium sized hut built on a four cent piece of land. The hut has three rooms, one 10 ft by 10 ft. and two about 5 ft by 8 ft. One of the latter two rooms is used as kitchen. The other room which is exactly the size of the kitchen is used by Sukumaran and his wife. The walls are made of unburnt bricks and the roof is thatched. There is a small platform built in front of her house where they can all sit down and relax in the evening. To one side of her kitchen, there is a small thatched enclosure built with coconut palm leaves for the goats. Both of the other two rooms have separate entrances. One enters the kitchen from the bigger room, which is also the living room. This room has only one small window overlooking the steep ridge, behind the hut.

Before this particular settlement of huts came into existence some ten years back, the site on which it is built was waste land belonging to the government. It was a steep slope full of bushes and trees. Like the other first settlers, Jayamma's husband and sons cleared the land and carved out a house site for themselves. The particular row of houses, of which Jayamma's is one, is a narrow ribbon-like stretch of land touching the top of the slope, barely wide enough for a hut. Actually, from Jayamma's back window all that you see is a steep slope with huts precariously perched here and there, giving one the feeling that they might get washed down any time in heavy rain. However, the window also commands a fantastic distant view, looking on to a lake and a vast stretch of green.

Jayamma had to move into this settlement ten years back after she was evicted from a similar settlement in an area which now comes within the city limits of Trivandrum. She and her

Table : Daily Calorie Intake in Jayamma's Household

(In calorie units)

	Working Day				Non-Working Day			
	Kannan	Anant	Jayamma	Vanaja	Kannan	Anant	Jayamma	Vanaja
Breakfast	700	711	585	570	700	700	600	600
B Lunch		308	220	206	—	—	—	—
Lunch	545	1,315	824	1,085	600	560	477	517
Tea	120	330	80	206	120	80	80	80
Dinner	1,038	1,170	1,091	1,012	939	1,025	600	700
All meals	2,403	3,834	2,800	3,079	2,359	2,365	1,737	1,897
Recommended norm (ICMR: 1968)	2,400	3,900	3,000		2,400	2,400	2,000	2,000
Shortfall or excess	+3	+66	−200	+79	−41	−35	−253	−103

Notes : (1) In the case of Kannan, the difference between working and non-working day revolves round the family's working and non-working day. He, however, manages to eat more or less the same every day.

(2) Jayamma not only eats less on both working as well as non-working days but she also tries to give up her share of rice for tapioca so that the men, particularly Anant, can have more rice. She skips her proper noon lunch even on working days.

(3) Jayamma tries constantly to see that Anant, the growing son, gets more to eat by giving up her share on a non-working day.

(4) Not only Anant but also Vanaja try to eat out as often as possible, both on working and non-working days. So even on non-working days they both are generally not deficient in calorie intake. Their problem arises only when there are four or five continuous non-working days at a stretch.

children were working already for brick kilns in that vicinity and decided to move here as this too was government land and it had a number of brick kilns close by. All of Jayamma's family works for the kilns except her husband. Her eldest son, however stayed behind near the old settlement to work for the old brick kiln where they all were working before. He was already married and wanted by then to set up a separate house with his wife.

Husband and Children

Jayamma is really the head of the household though her husband, Kannan is very much there. Kannan gave up work for good, some five years back. He spends his time now tending three goats (a mother and two kids) and looking after the house. When Kannan retired, his union paid him some sort of gratuity. Out of that money he had bought a female goat for Rs 150. This goat had two kids. After it went dry, Kanan sold it for Rs 110 and bought another goat, ready to deliver within a month or so, for Rs 150. Kannan kept the kids, however, so that once they are grown up, each of them will fetch the full price.

Kannan spends most of his time now taking the goats grazing in the ravine at the foot of the slope and collecting grass and leaves for them to eat. Being a man, he does not, nor is he expected to, help Jayamma with any of the female type tasks like carrying water, sweeping the house or cooking, though he has plenty of time and energy. Kannan does frequently work as a baby sitter not only for his married daughters living in the same settlement but also for other Ezhava neighbours. Though there are people from all castes living in the settlement, the Ezhava families tend to stick together.

Kannan once was a boatman transporting coconut husks, taking them through the backwaters,[3] but now he feels too old and his eyesight is weak. Boatmen who transport coir husks have very often to spend nights on the boat, taking a load of husks to its proper destination for retting. It is a strenuous kind of work involving long hours at a stretch, but lasts only a few days a week. Kannan depends completely on Jayamma for his survival except that when his goat gave milk he sold it to the tea shop and bought with that money beedies to smoke and also tea to drink.

None of Jayamma's six children went to school. She has trained them all as brick workers taking them along with her to work as they grew up. The brick industry is one where people of practically all ages can work. In a way, it is a temptation for parents to send children there, instead of school, to earn a living. Since the wages are paid according to the quantum of work done, all have a chance to perform and earn according to their respective abilities.

Jayamma would have very much liked her youngest son Anant to go to school. Actually, she could have spared him, for when it was his turn to go to school there were at least two or three earning members in the family. Earlier Jayamma could not afford the luxury of sparing any of her other children for school. She needed all the help she could get to make both ends meet. Unfortunately, Anant was not at all interested in school and preferred always to go along with his mother to the work site.

Work and Wages

Jayamma's work starts early in the morning at 7 o'clock. In order to present herself at the work site at that early hour, she has to get up at about five in the morning. She usually times this by the early morning plane that comes in from Madras to Trivandrum. She is the first one in the house to wake up and her first task is to go and fetch two pots of water. She has to get on to the main road and walk about a furlong to do this. For sometime the public water tap was disconnected as there were complaints against the squatter households bathing on the roadside. This is usually forbidden but it is seldom that municipal authorities go to the extent of cutting off the water supply. After the tap was disconnected, an unauthorised dent was made in the main pipe and water had to be collected with the help of small tin cans. Jayamma, and also other women of the settlement, had to spend thrice the amount of time they normally spend and never had the satisfaction of getting clean drinking water. There was nothing that she or the other residents of the settlement thought they could do to get the water connection restored. They have such a low status in the eyes of not only others but also themselves that they had no courage to take up the issue with the concerned authority. Since this was the only public water tap servicing more than forty households all of them were put to considerable hardship. Luckily, after about six months the water connection was restored. So Jayamma's first task in the morning has been made much easier.

Once she has brought the morning supply of water, she sweeps her front yard and kitchen and then goes down to the ravine for her toilet. The ravine has been divided into two parts, one used exclusively by women and the other by men.

It is too early in the day for her to have a bath. Moreover, she doesn't have time for it. Anyway, once she

comes back from work, she needs the bath badly as she is usually covered with mud and sweat. So she has only a small wash in the morning near the banana tree at the back of her house. She combs her hair in front of a small mirror and goes to the tea shop in the settlement itself to have a cup of hot sugary tea mixed with milk. Practically everyone in the settlement, men and women, stop for tea at the tea shop on the way to work.

Jayamma's work site is about three furlongs from the squatter settlement. Though there are a couple of other brick kilns, she and her family have always worked for the kiln belonging to an ex-military sergeant, a havildar, ever since she came to this settlement. She feels that it is better to work for the same brick kiln. Then she can not only be sure of work but also can expect to get a small loan in an hour of crisis. Also, her children are assured of employment.

On a clear day when the sun is bright, she is sure to get work. However, as a routine she will first present herself to the kiln owner and then start work. The place where the bricks are moulded and dried is usually a 10-minute walk from the brick kiln. Jayamma has to go there to start her work. She carries a small piece of old towel to be twisted into a coil to rest a wooden plank, 2 ft by 8 inches, on her head. The plank is used as a base on which the bricks can be placed. An adult woman carries 20 bricks at a time. She herself has to stack the bricks on the plank on her head while standing. She has to walk fast, virtually run, in order to dispose of the load quickly. As she reaches the brick kiln, a man will be standing there to receive and stack the bricks she unloads. He cannot help her unload it as she will lose her balance. The danger is two-fold, the bricks may fall and break or she may sprain her neck. Actually, the main brunt of the weight falls on her neck. So Jayamma unloads the brick herself, two at a time from the sides, handing them over to the man who is there to receive and stack them. Thus the whole operation of loading, transporting and unloading falls on her. The man helps her just at the final stage.

Whatever be the number of bricks she has carried which usually varies between 600 and 700 per day, Jayamma's wages are never more than five rupees. If she has carted more, it is because the distance she covers then is less. Her wage depends on both the distance she covers and the number of bricks she carts in the course of the day.

Jayamma has been doing the same job for the last thirty years. The day she was strong enough to cart twenty bricks on her head she had reached the limit. She cannot hope for any improvement in her work or earnings. Occasionally, the men may ask her to join them in stacking bricks in the kiln for firing. This needs some extra skill. Two bricks are lightly tapped and thrown at a time a few feet to the next man who in turn throw them to another man till they reach their final destination for stacking. The brick kilns are about 20 ft high and men usually form a conveyor belt to stack bricks. Doing this male work, however, does not bring Jayamma any extra remuneration, only it confers recognition on her as an experienced hand.

Sex-Typing of Work

In the brick industry there is very rigid compartmentalisation of work on the basis of sex Women are used here exclusively for the unskilled job of carrying head loads. If they are not carting bricks they are carting clay, but they do not have access to any of the other jobs, such as moulding, shaping, stacking and arranging in the kiln.[4] These are all exclusively male jobs. Moreover as we shall see, all these other jobs carry much higher wages, some nearly twice as much as women get for the load carrying jobs they do. The work that men do is also more interesting without always being physically more exhausting.

Compared to the woman brick worker's daily wage of Rs 4.50 to Rs 5, the woman construction worker, who too is usually confined to carrying head loads from one place to another, gets Rs 8 a day So even compared to women workers doing similar work elsewhere those engaged in carting bricks are at a disadvantage regarding their daily earnings.

Since at any one time no kiln employs more than twenty persons, the whole industry belongs to the unorganised sector Brick making is therefore considered a cottage industry. The workers, female as well as male, do not belong to any trade unions. But, as we shall see, women are the more exploited ones They hang on to it however because of (a) the uncertainty of work opportunity elsewhere, say in construction and (b) the continuity brick work offers in terms of employment.

Brick moulding is usually undertaken after paddy has been harvested. It is undertaken in the fields where the soil is clayey. Trivandrum, Quilon, Ernakulam and Trichur districts of Kerala are supposed to have the right clay, but brick kilns are spread all over the state.[5] You find, in between paddy fields, many patches whose land is left fallow and brick making takes place. It is common for cultivators to lease out their paddy land for brick making once in every two or three years. Usually land is given on lease for six months after harvesting. The idea is to get thereby the level of the land lowered somewhat so that (a) it can be terraced and water can flow from other parts more easily and (b) the top soil is removed and fresh soil from elsewhere mixed with manure can be put in its place.

Once a brick maker has taken a piece of land on lease — the going rate around Trivandrum (in 1976-77) has been around Rs 1,300 for the entire six months for 20 cents of paddy land — water is let into the patch to flood it for some days. Then the soil is dug up and kneaded into a clayey consistency They are supposed to dig only 2 ft deep all round. Dug thus, a twenty-cent piece[6] usually yields enough clay for 2,00,000 bricks. Usually, the soil is dug up in patches of 4 ft by 4 ft by 2 ft. Two men dig out the mud with a shovel and knead it thoroughly with their feet. They know by experience when the soil has reached proper consistency for the purpose of moulding If it is not raining, they make small clay mounds very near the place where they are kneading.

Each clay mound is 3 ft in height and diameter. Once clay is heaped to the required height and diameter, the outer edges of the mound are nicely smoothened and covered with coconut palm leaves which are supposed to shield it from the sun. In this way, the clay looses some of its moisture without forming a crust or cracking and remains soft to the touch. The mound has to be left like this for three days. After three days, the clay has just enough moisture to be shaped into a brick when pressed into the mould. The men who knead and heap the clay make about nine rupees a day, on a piece rate basis. But the job these men do is, no doubt, both strenuous and messy. They have to be knee deep in slush, constantly stamping away for eight hours with only small breaks.

Sometimes when it is raining, or threatens to rain, the kneaded mound has to be transported to an elevated site near the kiln itself so that the rain won't harm it.[7] Then the moulding is done near the kiln. Usually this need

arises during the monsoon season when brick moulding takes place intermittently. This task of transporting clay to the kiln site again is delegated to female workers. Moving a mound of clay carries a wage of twelve rupees irrespective of the distance and number of women working on the job.

A mound of clay yields 1,300 bricks and at least two mounds will have to be transferred to keep the team of two men occupied in moulding for a day. Thus if five women workers transfer two mounds a day they together can make Rs 24. When Jayamma has to cart clay she shares the work with her daughters and friends. The job is divided in such a way that one woman scoops out the mud with a ply plank and loads it on the other's heads. This is a messy job, though slightly more paying, but it is only done during the rains. Brick kiln owners themselves usually avoid this. They do not find it always economical in comparison to transportation of bricks. Moreover, space around the kiln can be a major constraint to undertaking moulding of bricks there. A normal-sized brick kiln around Trivandrum, with a thatched shed which has to be re-built every year, takes in around 75,000 dried bricks at a time. One moulding team of three men consisting of a mistry and two helpers can turn out about 2,600 bricks a day. Thus it takes roughly a month to feed the kiln which is usually fired once every month, except during the rainy season. Usually the same team of three, ie, the moulder and his two helpers, also undertake the firing of the kiln after the bricks have been set in.

Thus, with three men employed on moulding, two men in the field digging and kneading clay, five to six women carting bricks, and two men unloading and stacking bricks at the kiln, each kiln of an average size in Trivandrum district can be said to employ regularly 12-13 persons a day. In the monsoon months, however, the firing does not take place every month. On an average, a kiln is fired ten times in a year. Therefore, in the monsoon months, the work, be it moulding, transporting or stacking, gets staggered and employment opportunities are less.

The mistry in the moulding team makes the highest piece rate wage of around Rs 12 a day; his two helpers come next with Rs 10 a day. The kneading of the clay, though strenuous, does not carry high wages. The men engaged in kneading, as already stated, make Rs 9 per day. The men engaged in stacking bricks at the kiln make more than Rs 10 a day. As for the women who only cart bricks or clay, they never make more than Rs 5 a day.[6]

Jayamma's two sons have, luckily, graduated to the position of moulding assistants and therefore make about Rs 10 a day. Her eldest son helps with moulding for a brick kiln that Jayamma herself worked for several years back. Her second son does similar work for the kiln she is now working for. Her three daughters, two married and one still unmarried, also work for the same kiln, but being women cannot aspire to do anything better than head load carrying. So while her sons make Rs 10 a day each, Jayamma and her daughters make Rs 4.50 and Rs 5 everyday they are in employment.

Feeding the Family

Jayamma does her shopping every day on her way back from work. She buys only fish and spices at the evening bazar held near the squatter settlement. These together cost her between one and one and a half rupees. Her neighbour, who is a tapioca vendor, delivers tapioca at home. Kannan is there to collect it. Jayamma herself does not buy soap or oil. The earning children must do that out of their wages, for each gives to the mother only between one and two rupees each in cash. Most of the rest of what each earns is spent on tea/coffee, breakfast and lunch. Since Jayamma buys only tea and tiffin, she herself does not spend more than one rupee on eating out. But she is a 'pan' addict and that means 50 paise every day. So she herself comes back home from work with a cash amount of three rupees. With half of that accounted for, by fish and spices, the balance is just enough to pay the tapioca vendor for the four kilos of tapioca she has a standing order to supply.

Jayamma has always bought her rice from the ration (fair price) shop. On a 14 unit ration card, she is entitled to 11.20 kgs of rice every week which costs Rs 17.15. She does not buy any wheat whatsoever and surrenders her sugar entitlement in favour of the grocer who is always ready to buy sugar from her at 50 paise per kg below the ruling retail price. It is important to note that Jayamma can buy her rice ration out of the money which her earning children give her every day because, as has been noted above, her own wage is enough to buy tapioca, fish, spices.

Though her two younger children, unlike the older ones, don't contribute to the mother's pool of daily cash more than the very minimum, largely because of the widespread practice of eating out, their contribution has been adequate, so far at least, to enable Jayamma to avail herself of the rice and sugar entitlement. Indeed Jayamma, unlike several neighbours of hers, has never had to pawn her ration card, not even to raise money once every two years to replace her thatched roof.

In Jayamma's house, there has all along been only one major meal, which is cooked by her in the afternoon after she gets back from work. Since the household consists of virtually all adults and earning members the system works out reasonably well, at least now. Practically, every one has his/her tea, breakfast and lunch at the wayside eating places. There are plenty of such places to go to. The result is that everyone spends a major portion of his/her wage on eating out. Jayamma, is the one who usually spends possibly the minimum on eating out. But the younger members of her family are not that careful in spending. Kannan, who stays behind, having retired from work, goes to the tea-shop in the squatter settlement for tea and shares whatever is left over from the previous night's rice gruel with Anant, the younger son, if he hasn't found some work. The day Anant gets work, he eats his lunch and tiffin out. Since Kannan must have his tea cups every day at the tea shop and his quota of bidis, he needs about one rupee a day for his pocket expenses. When the goat was giving milk, he sold it to the tea shop and was nearly self sufficient. Sukumaran, the second son, has so far always made up whatever is his father's daily deficit which may range from 25 paise to one full rupee.

Bringing up Children

Jayamma has virtually grown up around the brick kilns. Her parents died when she was very young and she was raised by her mother's sister who was also a brick worker. Her father was a landless labourer attached to a big landlord and her mother eked out a livelihood as a vegetable vendor while she was alive. Even when Jayamma was nine or ten years old she would often go to the paddy fields to cart a few extra bricks for her aunt. As was stated above, brick carting is done by people of all ages. Young children carry just as much as their tender heads can hold and try to earn some money for their parents. Her aunt got Jayamma married at the age of 16 to Kannan, an Ezhava boatman

from a nearby village whose job was to transport coconut husks through the backwaters. Jayamma moved to her husband's house and stayed home without working, but only for a year. The very next year, her husband Kannan got an offer to work as a coolie for the army. He went all the way to distant Assam and Jayamma was left to fend for herself. So she started working for the brick kilns, the job she was familiar with, and came back from her husband's village to live near her aunt.

Traditionally, the Ezhava community has always been closely associated with the coconut and palm culture. They have been traditionally toddy-tappers. Also, they are known to do all jobs which have generally anything to do with cocount cultivation and use, including transportation of coir husks and coir making. After he came back from his brief interlude with the army, Kannan went back to his old job as a boatman, transporting coir husks through the back waters. But he himself never owned a boat of his own. The coir husks were collected from different places and then loaded on to a country craft. A boat of this kind can carry about 75,000 husks Kannan used to ply the boat between Pachallur and Akulam, some 20 kms apart. Usually, he worked in a team of three men. It takes a long while to manoeuvre the boat with the help of a pole, as in some parts the back waters are not only not deep but also densely covered with water hyacinth, the African payal.[9] It took them 24 hours to reach the destination. Together, the men got Rs 20 for every trip, but their in-transit expenses were also quite high. Being a strenuous job, lasting long hours, in damp surroundings, a good portion of wage was spent on food and drink. The men who worked on this job were almost all given to liquor. Kannan too spent a good part of his earnings and by the time he got home he could give Jayamma hardly three to four rupees. This was just enough to take care of feeding Kannan for the rest of the week. The rest of the family had therefore to be provided out of whatever Jayamma and her children earned from carrying bricks.

Jaymma's earnings were always so important to the family that she had to work till the last day of her several confinements. She delivered all her chidlren at home with the help of a mid-wife and her aunts. Jayamma feels that she didn't have much of a problem working till the last day and her deliveries were easy since her body and muscles were all supple. She remembers staying in the house after delivery for only a month and then getting back to work leaving the baby either at the neighbour's or with a relative. As her children grew up, she decided against sending them to school and started taking them with her for work. She felt that it was no use sending them to school just for a short while as they would anyway not get any better job with just a little bit of education.

When her first son became a helper to a mistry, Jayamma got him married the moment she got an offer from one of her caste group. They got some two tolas (i e, about 25 grams) of gold and some 300 rupees in dowry.[10] This was the first time in her life she had some money to spend. Within a year however the son and his wife decided to set up a separate establishment and Jayamma could not do anything about it. After all, the son was economically independent.

Daughters' Marriages

Two of her daughters, Suvarna and Shamala, were now going to work with her. Though Jayamma had taken some dowry for her son's marriage, she had not, and could not, make any provision for her daughters' marriages. She knew however that no match could be arranged for the girls without dowry. So she just waited and hoped for the best. Both the daughters were very good looking, however, so she knew something would turn up one day. Her only wish was that they should get married to Ezhava boys.

Very soon an Ezhava boy Ravindran, fell for Suvarna and she decided to go and stay with him. Ravindran, however, was only a casual labourer and was already a drink addict. Jayamma didn't quite like the match therefore, but had nothing to say as she had no alternative to offer. Then one day, some two years after Suvarna started living with him, Ravindran fell down while riding a rented cycle and broke his arm. He went to the nearby public hospital and got it fixed but somehow the fracture was not attended to properly and to this day he has the full use of only one hand. So he has been a drag on Suvarna ever since. Quite often, however, he goes away from the house to stay for days on end with his own mother. But so far he has always come back. Suvarna is happy whenever he comes back, because she feels it is better to have a man around the house than none. Thus Suvarna had to take over the full responsibility of running the house soon after her marriage and now has two children, a son and a daughter, to look after as well.

When Jayamma moved to the present settlement 9 or 10 years back she asked her daughter, Suvarna, also to move and be near her. With her husband already dependent on her, Suvarna needed the moral and physical support of her own family. They cleared another two cents of land towards the foot of the same hill for a hut and moved Suvarna and her family there.

Within a year of the move, Ravindran decided to undergo vasectomy. Suvarna needed money to re-do her roof which wasn't good. The thatched roofs need to be done every two years, on average, and this can be a major expense for a low income household. To get money for re-doing the roof, the choice was between 'mortgaging' the ration card or one of them going to the family planning clinic where he or she would get paid for undergoing the 'operation' Since they already had two children, one son and one daughter, Ravindran decided to undergo vasectomy and make a contribution. This happened also to be the time when a major vasectomy camp was organised in Trivandrum.[11] Unfortunately, after that their son got jaundice and died. So they are left with one child only, a daughter. She has studied upto the 5th class, and is the first literate person in Jayamma's family. But now she is going to work at the brick kiln with her mother to supplement the family income.

Recently, when her house roof gave away again during the rains, Suvarna had to come to her mother Jayamma for shelter in her house. Suvarna cooked separately for herself and her daughter in the goat shed but slept with her parents in their room. Ravindran went away to his mother. Eventually, when they can collect some money to buy the materials, Suvarna's father, Kannan and her second brother will rebuild her roof. Ravindran will probably turn up to lend some help in the manual work.

Jayamma's second daughter, Shamala has been a great help to her. She would go with her mother to the brick kiln and all her wages went to the family. Actually, it was with the help of Shamala and Sukumaran's wages that Jayamma could build all her house with unburnt bricks and even put in doors and windows. But this could not last for all time to come. Shamala is extremely good looking. So young men in and around the

settlement were always hovering around her. Between working for brick kilns and at building sites, Shamala prefers the latter as the work there is better paid. But apart from construction work being seasonal, it is difficult to get regular work unless one is close to a mistry. Some years back Shamala was working at a construction site where her mother's cousin's son also had a job. They got to know each other intimately. Among the Ezhavas, however, such an alliance is not considered right. So the boy's parents in particular *disapproved of the growing* relationship between him and Shamala. The young people decided all the same to go ahead and set up a house of their own and started living together. Shamala had a small gold chain which she sold off to put up their hut. Unfortunately, the arrangement did not work for long. The boy was always suspicious of other workers' intentions about Shamala and also was uncertain that Shamala was disinterested in other young men. So there were often quarrels between the two and Shamala was back home with Jayamma, her mother, within a year. According to Jayamma, men who work for the construction industry, like taxi drivers, cannot be trusted with girls, for they are apt to change their women at the slightest pretext.

After a lapse of two years, Shamala fell in love with a Pulaya[12] low caste boy, Suren. His family also lived in the same settlement. Jayamma knew of the budding romance but was hoping that it would eventually fade out. He was younger than Shamala by about five years. His widowed mother was a poor agricultural labourer and he had two younger brothers to look after. The other people in the colony felt however that Jayamma was encouraging the romance. At least, she did not put her foot down to stop it. Anyway, one fine day, Shamala decided to elope with Suren. Now Shamala and Suren live in the same settlement in Suren's mother's hut. When Shamala had a baby boy, she would leave it with her father, Kannan while she was at work. Jayamma had a small cloth cradle made for the infant and it was hung up in her living room. Indeed, the child is now really a part of Jayamma's house

Though Suren finds work off and on and *brings* in some money, his responsibility is great. His mother doesn't make much money. His two younger brothers are still going to school. There was a short period when no one in Suren's house had work except Shamala who was going to the brick kiln, Shamala resents however sharing her wages with Suren's family and has started cooking separately in the same hut. Suren's mother, in turn, is not prepared to share with her daughter-in-law the ration allotment.

When the roof of their hut collapsed recently the two separated families had to live right there with some makeshift shelter. Unlike Suvarna, Shamala does not have access to her mother's house in such circumstances, certainly not along with her husband, for she *is married below caste.*

A Dowry Marriage

All along, the person who was until very recently a real help to Jayamma was Sukumaran, her second son. He earned ten rupees a day and contributed a good part of his earnings to the family. He had no vices. Jayamma liked having him work for the same kiln. This meant a lot of respect for her and the other workers were scared of treating her roughly lest Sukumaran pick up a quarrel with them on that score.

Though Sukumaran was only twenty two years old, a good offer came for his marriage. The girl's party was willing to give a dowry of one thousand rupees and two tolas of gold. Also, the girl would have in her name some 25 cents of garden land, ie, land on which you can grow tapioca and coconut but not paddy, in a village called, Attapara, only 10 kilometres away. The girl was literate, having attended school for five years, and good looking. Kannan, Jayamma and the rest of the family went with Sukumaran to visit the girl's family and the marriage was agreed upon.

The date was to be fixed for the earliest auspicious period. Jayamma and Kannan were very excited about the offer of dowry and did not want to take any chances lest Sukumaran might decide to marry of his own accord. Given the type of neighbourhood in which they were living, this sort of things could happen any day. Not only would Jayamma then have to put up with any sort of girl but also lose all chance of a dowry In the settlement, though the common law type of marriage (ie, living together as husband and wife by mutual consent *without any formal contract* sanctioned by law or religion) is looked down upon, it has been quite the order of the day. Both Suvarna and Shamala had this type of marriage. Why expose Sukumaran to the same danger? A dowry marriage was a real prestigious affair. In this particular case, the girl's party was better placed than the boy's party since the girl's three brothers were masons, though she had lost her father.

Jayamma's first job was to go and get a horoscope cast for her son. They got hold of an Ezhava pundit and paid him fourteen rupees to cast Sukumaran's horoscope. The pundit also matched the horoscope with the girl's and found that the earliest most auspicious day for their marriage was the *day of Onam*[13] *in 1976. They had to* pay him another five rupees for this. After all, this was a proper marriage, which would give the family a lot of prestige in the neighbourhood; hence these expenses had got to be incurred.

Once the marriage arrangements were finalised, Sukumaran collected the cash from the girl's party in three instalments. With the first instalment of 300 rupees, Sukumaran brought two nylon sarees, with blouses and petticoats to match, two lungis and two towels, all for the bride. He also bought a small box, the first of its kind in their home, to keep the clothes. Ordinarily, they hung all their clothes on a clothes line or two running lines between the two walls.

Sukumaran bought for himself one new lungi and two new shirts. Also, he bought a set of new clothes for his parents, his unmarried sister and *younger brother. He bought all these* clothes from the same shop after he collected some more cash from the girl's party. By the time everyone in the family had new clothes, he had spent some 500 rupees.

Suvarna, the eldest daughter, went to the city market and did all the grocery and vegetable shopping. A nearby bakery and the suqatter tea shop were asked to supply cakes, banana chips and coffee. Women from the neighbouring households were mobilised to help make idlies for the marriage feast.

The marriage took place on the Onam day in a temple about 2 kilometres away from the squatter settlement For a week after the wedding, the house was full of people, visiting and congratulating Jayamma Sukumaran and Sujatha used the smaller of the two rooms in the house and the rest of the *family* shared the living room No one from Jayamma's house had gone to work. Anyway, the brick kiln itself was closed for more than a fortnight because of rains. Then Jayamma got ill from over-exhaustion. For nearly a

fortnight, the six people in the house were living on the left over dowry money. The two married daughters and their children were also present most of the waking hours. Then, because of a spell of heavy rains soon after Sukumaran's marriage, Suvarna's roof gave way and she along with her daughter had to be accommodated by Jayamma. It was not for nothing, therefore, that Sukumaran, the newly married son, was showing signs of irritation with the house and the people living therein.

Jayamma's Illness

Jayamma was aware of the tension that was building up in the house. She moved out her goats and gave the little 8 ft by 4 ft goat-shed to Suvarna to cook her food separately. Sukumaran started going to work; but whatever he brought was not enough. He could not even take his bride to a movie. Day by day, he started giving less money to the family So Vanaja, the unmarried daughter, also resumed going to work

Jayamma's flu showed no signs of leaving her. So she went to the nearby Medical College Hospital. She had to take her ration card for identification and wait in a long queue. They finally examined her and gave her an injection and a prescription for medicines to buy. Jayamma was however not happy with the way the doctor disposed her of. She was sore also at the long time it took the doctor to see her. So she did not buy the medicines and refused to go for further injections. Instead, she went to a nearby clinic run by a church school. She felt she got better attention there, but it did not really put her back on her feet. Finally, she went next time to the Government Ayurvedic Clinic and only then did she start feeling better.[14]

When Jayamma was ill she almost felt like giving up work altogether. She felt that the work at the kiln was too hard. But when she saw the tension building up at home she thought it was better for her to go to work somehow. But even before Jayamma could do this, Sukumaran and Sujatha went away for a while to stay with the latter's family.

Ostensibly Sukumaran wanted to have a look at the land which was in Sujatha's name. Sujatha too was happy to go back to her mother after a month and a half, with her in-laws. Once they went, it took them over a month to come back. Sukumaran decided to plant tapioca on Sujatha's land. Also, his mother-in-law's roof needed replacing. So he pawned off Sujatha's gold and bangles for a loan of Rs 400 from the bank. He lent his monther-in-law Rs 150 to re-do her roof and spent the rest on planting tapioca with the help of two other men.

In the meantime, the family at Jayamma's house had to manage with only Vanaja's daily earning. That hastened Jayamma's decision to go back to work. She thought she could start by carting smaller loads of, say, 250 bricks at a time. Having mentally reconciled herself to the idea that she could not stop working, she soon started to feel better. Onam, 1977, is already past and Jayamma has been fully at work for over a vear since Sukumaran's marriage.

When Sukumaran and Sujatha came back after six weeks, Sujatha was expecting a child. Sukumaran had come back determined not to contribute to the daily family pool of cash more than 3 or 4 rupees. Before his marriage, he gave 5 to 6 rupees daily. Naturally, there were constant arguments. Finally, Jayamma told Sujatha in a huff, to cook separately if she wanted. That was what Sujatha and Sukumaran wanted but had not been bold enough to suggest to her. They started using the goat shed as their kitchen The news of separation of the kitchen spread like wild fire in the neighbourhood.

The seeds for the eventual complete separation of Sukumaran from his mother had thus been sown. Luckily, the application with the village office for the allotment of land on which she is squatting with her family is in Jayamma's own name. If ever it is allotted, the land on which her house stands will therefore belong to her, and not to Sukumaran, who must eventually move out.

Jayamma knows she has nearly lost Sukumaran and will soon lose Vanaja, her unmarried daughter, because she is bound to go off with some boy or other the same way that her elder sister went off. Jayamma still has one more son to hold on to. Though she has gone back to work, she has not given up hope that some day she can stop work and someone will look after her and her aging husband, Kannan.

Death of a Goat

Kannan too was so involved with the quarrels going on in the house after Sukumaran's wedding that one day he forgot to check on his pregnant goat at lunch time. He had taken her down the slope to graze early in the morning and had tied her near Suvarna's house at the foot-hill of the ridge. The goat was tied up with just a two ply coir rope which snapped. It appears that wandering around it must have found tapioca peels and eaten some. But tapioca peels are poisonous and make animals giddy.[15] By the evening, the goat was ill and bleating in pain. When the message reached Kannan, Jayamma and Kannan immediately rushed to see what had gone wrong Their first suspicion was foul play. Jayamma even suspected for a moment that Sujatha, her own new daughter-in-law, might have, herself or through some lady, done some black magic on the goat. Luckily, the goat still had some small pieces of tapioca skin in its mouth and that should have dispelled all such doubts. Still, while they immediately tried to get some local herb medicines, they also looked for the squatter washer-woman to remove any possible spell Every neighbour who came to watch had his or her own remedy to recommend. Jayamma ended up spending some three rupees desperately trying to save the animal But it was too late.

Naturally, Kannan's immediate concern was to recover as much money as possible. He asked his paraiah[16] neighbour, a professional butcher, to cut up the goat. The neighbour demanded in return not only the usual one kilo of meat but also the goat skin, knowing that it was too late in the evening for Kannan to get anyone else to do the job for him. The goat skin, if properly reclaimed, usually fetched around Rs 20. Naturally, Kannan refused to part with it free. The butcher still cut up the goat but cut up the skin so badly that Kannan could not sell it. He could only sell the goat meat to the neighbours but that too at half the market price and recovered only around Rs 20.

The loss of the goat was a major setback, particularly for Kannan. As was mentioned earlier, Kannan had bought the goat for Rs 150. It was pregnant Kannan was hoping that it would not only start giving milk soon but also deliver a couple of kids that he could bring up. Already he had two young goats from his earlier goat. Eventually he hoped to get together enough money to buy a cow for the household. Only two other households, in this squatter settlement of forty two, have cows. All his plans were now dashed.

Jayamma was sad too not only be-

cause the goat was so close to Kannan's heart but also because it made Kannan feel useful. Kannan was able to buy his bidis and an occasional cup of tea at the nearby shop with the money he made from the goat's milk. Now Kannan was left with only two young goats to tend. If nothing happens to them, he should be able to sell them for Rs 150 each in about a year. But that sum will not be enough to buy a cow for his family.

With Sujatha cooking separately and Kannan's goat dead, the year beginning with Onam of 1976 did not turnout to be as good as Jayamma had expected.

Propitiating the Goddess

It was the month of March 1977 and the nearby Devi[17] temple was being got ready for its annual celebrations which are timed more or less with the harvesting of the winter (mundakan) paddy crop. Jayamma's third son, Anant, wanted to join other children of his age group, 11 to 15, in the ceremonies. On the appointed day, the children roll round the temple deity in a lying down posture. (This particular ceremony is called 'urul'.) To do so, Anant would have to prepare himself by going on a completely vegetarian diet for a whole week. Also he was not to eat during that week any food cooked the previous day. Obviously, this meant that he could not eat for breakfast left over rice from the previous night. Jayamma would have to either cook fresh food or give him money to buy his breakfast. Also she must cook a proper vegetarian meal for him in the evening. Ordinarily, she cooked some fish which they all ate with rice and tapioca. Buying vegetables would mean extra expense. Then a new towel would have to be bought for him. Excluding the sweet rice (Ponkala)[18] offering at the temple, all told it would cost Jayamma at least 25 rupees.

On the appointed day, Anant had to fast and go without food altogether from morning. He was taken to the temple in the afternoon. There, he wrapped himself in the new towel after a dip in the pond near the temple. The priest took all the boys in a group to the pond. Then he and other boys were brought ceremoniously to the accompaniment of drums and tom toms. Once the boys reached the temple entrance they were asked to lie flat on the stomach and start rolling round the deity[19] to the accompaniment of drums. Kannan and Sukumaran helped Anant roll round and round the temple. In about one hour Anant and all others in his group were in a sort of trance. This took about an hour. Rolling round and round on an empty stomach with the sound of the drums and tom toms, even an adult would feel dizzy after some time.

Jayamma had taken a vow to cook sweet rice and offer it to the deity. So she was in the temple yard cooking sweet rice in a new mud pot in the company of some 200 other women all sitting next to each other in a row, each with her own stove, mud pot and cooking ingredients. The Ezhava temple priest came round and sprinkled the holy water on everyone's sweet rice. Jayamma left a portion of her cooked sweet rice for the temple and took the rest home to share with Anant and the family. Kannan and Sukumaran walked Anant back home and gave him first a cold water bath and then coconut water to drink.

Jayamma prayed before the Devi and asked her for the early allotment of the land on which she was squatting. She felt mentally much better thereafter and more reconciled to the family situation as it had evolved during the year. She felt that the extra money she had spent on Anant was well worth it.

On the eve of Onam 1977, Jayamma's house had two kitchens, one Sujatha's who now had a two-month old baby girl, and the other Jayamma's own. Sujatha had not gone out for work ever since she was married. Will Sukumaran ever ask, or let her go out for work? Jayamma doesn't know. Probably not, but why should she bother now? Sukumaran doesn't help his mother with any money whatsoever any longer.

The Last Four

Going by the Census definition of a household comprising only of those who share a common kitchen, Jayamma's household consists now of only four members. Kannan, her husband, is the only dependent member. The other three, including Jayamma herself, go out to work as often as possible depending on the availability of work. And since brick kilns, at least in Trivandrum district, work practically all round the year except during the south-west monsoon when they go slow, work opportunities are there for 280 days in a year. But the daily wage for women working for the brick kilns is distinctly lower not only in comparison to men working for the brick kilns but even to women working in the construction industry. The nature of the job women do in construction industry is exactly the same as they do for brick kilns, namely head-load carrying. But working for brick kilns, a woman has to work for every paisa because what she collects by way of wage at the end of the day is calculated on the basis of the number of bricks or the basketfuls of clay she has carried. Still she never earns more than two-thirds of what she would get in construction. Jayamma knows all this. However, unlike other women including Suvarna, Shamala and Vanaja, who do switch over to construction work during its peak days when anyone available is taken on, Jayamma stays with the brick industry. But as she grows older and therefore weaker, she will be able to carry fewer and fewer bricks in a day. So her daily earning will also decline.

It is this thought of the not-too-distant future which makes Jayamma feel extremely dependent on Anant, the young unmarried son. Anant spends the major part of whatever he earns on eating out. Still, when he comes back home, he must be attended to most. Jayamma serves him larger quantities of food. He gets more of rice than tapioca. So, as can be seen from the distribution of calorie intake within the household, Anant does relatively the best, even on a day he is not working. Who fares worst in this regard? Not Vanaja because she is an earner in her own right and insists that she too must have full freedom to do what she likes with her wage. Not Kannan either, because after all he is the head of the household. So naturally, it is Jayamma herself who eats more of tapioca than rice, who eats only the left over of fish and who in the end has a shortfall in calorie intake on both the days she is working and the days she is not working. But the shortfall is greater when she is not working. Will this pattern of her living itself not bring the day she fears most closer? "No, this is the only way I can provide for our old age."

Notes

1 According to the 1961 Census, which gives figures caste-wise, Ezhavas comprised 22 per cent of the population of Kerala State. They are, as George Woodcock puts it "the leading caste of all outcastes". See "Kerala: A Portrait of the Malabar Coast", Faber and Faber (1967) p 63.

2 Brick-making is a major cottage industry in Kerala involving making and baking of hand moulded

[illegible] mate, not less than 1,20,000 workers are engaged in making hand moulded bricks in the state. See Report of the Minimum Wages Committee for Fixation of Minimum Rates of Wages for Employment in Bricks Manufactures, Kerala (1971), Government Press, p 8. (Hereafter, we refer to it as Report of the Minimum Wages Committee for Bricks.)

3 Till the middle of the last century there were no good roads in Kerala and inland trade was carried on almost entirely (in boats) by backwaters and rivers and connecting canals. They provided excellent means of transport for conveying the commodities of the interior to the ports and thus contributed to the early economic development of the state. (See "Travancore State Manual", V Nagam Aiya, Trivandrum, Government Press, 1906, p 155.) While the major part of the state's agricultural output is now transported by road and rail, backwaters and connecting rivers and canals are still used extensively for the transportation of coconut husks to the retting centres.

4 See Report of the Minimum Wages Committee for Bricks, *op cit*, p 21, for a complete list of the various types of jobs involved in the industry.

5 The districts mentioned in the text are observed to employ the largest number of workers in brick making industry. See Report of the Minimum Wages Committee for Bricks, *op cit*, p 9.

6 In Kerala land area is expressed traditionally in acres and cents. Thus 20 cents represent one-fifth of an acre.

7 If during drying, even a few drops of rain fall on the brick it has to be wetted and kneaded back to clay and moulding repeated. For this reason, manufacture of country bricks takes place at a very much slower pace during the rainy season.

8 According to the minimum wages fixed in 1971, the differentials between the skilled, semi-skilled and non-skilled workers were to be rather small on the basis of the piece rates recommended by the Minimum Wages Committee. While the daily wage for unskilled work would work out to Rs 3.25, it would be Rs 3.55 for semi-skilled work and Rs 3.85 for skilled work. Evidently, the differentials have become very much wider between unskilled work, which is very largely female, and semi-skilled and skilled work, which is exclusively a male preserve.

9 Traction by poles through shallow water has been the primordial means of locomotion, but it must be noted that this involves continuous and hard exertion for the boatmen.

10 Dowry to the bridegroom was in fact absent among Ezhavas in the olden days. Rather the bridegroom had to give a nominal amount to the girl's father as bride price. [illegible] recent years [illegible] dowry is becoming more and more common now even among the low income Ezhavas. See Census of India, VII, Kerala, Village Survey Monograph, Trivandrum District, (1963) p 129.

11 The sterilisation programme is far advanced in the state. Of the 26 per cent couples "protected" by the end of 1975-76 by various family planning methods in the state, 92 per cent had undergone sterilisation. See "Statistics for Planning", Kerala Bureau of Economics and Statistics, (1977) p 249.

12 The Pulayas, a major scheduled caste in Kerala, occupy a very low rank in the social scale. They were considered such a polluting caste that even other polluting castes above them were polluted by them. See, "Travancore State Manual", V Nagam Aiya, Government Press (1906) p 407.

13 Onam is the principal festival in Kerala. It falls in mid-September, towards the end of the south-west monsoon. It commemmorates the golden age of King Mahabali, a legendary ruler of Kerala, who is supposed to revisit his land on this day. The Malabar New Year also starts then.

14 In 1974-75, there were 65 Ayurveda hospitals and 382 dispensaries in Kerala, in addition to a very large number of private clinics practising the same system. In addition there were 8 hospitals and 113 dispensaries practising homeopathy. Over and above these, there were 135 hospitals, 162 public health centres and 552 dispensaries, all practising modern medicine, with 27,568 beds, spread all over the State. See "Statistics for Planning", *op cit*, p 245.

15 That tapioca skin can be very poisonous is very widely known in Kerala. See Census of India, 1961, Vol VII, Kerala, Village Survey Monograph, Trivandrum District (1963).

16 Paraiahs comprise the second largest scheduled caste in Kerala, after Pulayas.

17 Devi, the personification of female energy, is the source of all divine and cosmic evolution. "Devi Mahatmya" says that Devi takes three forms, Mahalaxmi, Maha Saraswathi and Maha Kali, representing the Sathvika, Rajasa and Thamasa attributes or Gunas of Prakriti. In the fierce aspect she is mentioned as presiding over other minor goddesses controlling epidemics, sickness and evil spirits and is worshipped under the names of Mahakali, Chamundi, etc, in accordance with Tanthric rites. See *"Travancore State Manual"* STK Velu Pillai, Government Press (1931) p 582.

18 Ponkala is an offering usually made in Bhagavathy temples on the 9th day of the Devi festival. It is prepared in the form of pudding by cooking together rice, jaggery, coconut shavings and plantain fruit in varying combinations. By the evening almost all the Ponkalas [illegible] all over the [illegible] around the temple, [illegible] innumerable ponkalas would have been prepared, and blesses them by sprinkling holy water and flowers. See Census of India (1961), Vol VII, Kerala Part VII, B(i), Fairs and Festivals, 1966, p 101.

19 Urul Nercha is done by males of all ages. It starts at about 4 pm with accompaniments like nadaswaram, drum, etc, and continues for one or two hours in the midst of a packed crowd. There will be several persons participating in the Urul. Every such person will be flat on the ground and rotate himself sidewise and circle the temple at least thrice. See Census of India, 1961, VII, Kerala, Part VII B(i), Fair and Festivals, (1966) p 106.

Not By Good Intentions

NECESSITY, in our conditions, produces not invention but statements of good intentions. The sharp rise in oil prices in 1973 provoked instant concern about an energy policy. Accordingly, the Ministry of Energy was constituted in 1974 with responsibility for, among other things, preparing and implementing such a policy. Now, five years later, we once again hear the Minister for Petroleum and Chemicals saying that if he had his way he would permit the use of petroleum products and gas only as feedstock for industry and not as fuel for power generation and domestic purposes.

The provocation for this latest outburst of good sense is the prospect of a stupendous rise, estimated at around Rs 500 crores, in the import bill for crude oil and petroleum products in the current year. This increase is only partly the result of the decision of the OPEC countries to raise the price of crude oil from $ 12.70 per barrel to $ 13.335 per barrel from January 1, 1979 and, in three further instalments, to $ 14.542 per barrel by October 1, 1979. More important, because of the disruption of oil production in Iran, there has emerged a world-wide shortage of oil as a result of which actual market prices of oil are far — at times even 70 to 80 per cent — in excess of the prices nominally fixed by the OPEC. Iran used to be our largest single source of crude oil, accounting for over 30 per cent of our total crude imports. The gap left by the non-availability of Iranian crude can be filled only by purchases at or near the current high market prices.

Earlier this week, after signing a protocol for the supply of a million tonnes of crude from Algeria, the Minister of Industry declared with a flourish that "we should have no oil problem", pointing out that, apart from Algeria and Iraq, Libya had also agreed to supply 2.5 mn tonnes. The crucial question, however, is at what prices? Given the very high prices currently prevailing, and which are expected to be more or less sustained throughout this year, no oil exporting country is prepared to supply crude at the OPEC-fixed prices, except where it is bound by long-term contracts. Even supplies already contracted for are not protected against the price increase, as the attitude of the Soviet Union has shown. The Soviet Union is known to be demanding current market prices for the 1.6 mn tonnes of kerosene and high speed diesel oil which it had already contracted to supply during this year. It has also demanded the same in respect of the 6 lakh tonnes of crude which it recently agreed to supply in exchange for Indian rice (to be supplied to Viet Nam on behalf of the Soviet Union).

This situation calls for something more than a reiteration of faith in the need for an energy policy. For one thing, facts do not suggest that there has been a runaway expansion of demand for petroleum products in the country. Consumption of petroleum products rose from 17.91 mn tonnes in 1970-71 to 25.59 mn tonnes in 1977-78, which gives a simple annual rate of growth of a little over 6 per cent. To be sure, this is not to be attributed to the success of any deliberate policy of rationalising the use of petroleum products, but rather quite simply to the operation of the price mechanism following the steep rise in petroleum prices in 1973 and to the overall low rate of growth of the economy and the industrial sector in particular.

On the other hand, the general impression of petroleum exploration, production and refining having been one of the dynamic sectors of the economy is also not borne out by facts. The annual production of crude oil increased by 3.32 mn tonnes in five years from 3.47 mn tonnes in 1965-66 to 6.82 mn tonnes in 1970-71; in the next seven years from 1970-71 to 1977-78 the increase was only 3.94 mn tonnes. The rise in domestic crude production did not keep pace even with the altogether modest rise in the crude throughput of refineries in the country. The annual throughput of the refineries rose by 8.15 mn tonnes from 10.23 mn tonnes in 1965-66 to 18.38 mn tonnes in 1970-71 and by 6.52 mn tonnes between 1970-71 and 1977-78. The gap between domestic crude production and the throughput of the refineries widened from 6.76 mn tonnes in 1965-66 to 11.56 mn tonnes in 1970-71 and further to 14.14 mn tonnes in 1977-78, necessitating growing reliance on imports of crude oil. On the oil products side the annual output of the domestic refineries went up by 7.55 mn tonnes from 9.56 mn tonnes in 1965-66 to 17.71 mn tonnes in 1970-71 and by only 6.11 mn tonnes between 1970-71 and 1977-78. The gap between consumption of petroleum products in the country and their production by the indigenous refineries, which had been almost bridged by 1970-71, has widened in the last few years. It was 2.37 mn tonnes in 1977-78 and 3.46 mn tonnes in the first nine months of 1978-79.

Immediately, the situation on the petroleum front is attributable also to the crisis in the coal and power sectors. The power crisis has necessitated

desperate measures like the import and installation of generating sets run on diesel. It has increased the demand for diesel for running agricultural pumpsets. In many parts of the country, diesel is reported to be selling at a black market premium of 40 per cent or thereabouts over the official prices. The non-availability of coal has similarly forced industrial users to switch to fuel oil. Statistics of coal production and despatches present a truly appalling picture. According to the annual report of the Ministry of Energy, production of coal in the first 11 months of 1978-79 was 90.76 mn tonnes, which means that coal production was stagnant for the third year in succession. The position with regard to despatches is even worse. At 86.74 mn tonnes in the first 11 months of 1978-79, despatches from the mines actually showed a fall of 3.58 mn tonnes over the same period of 1977-78.

In dealing with this situation, any talk about the importance of an energy policy or about not permitting the use of oil as fuel in industry or for power generation is largely beside the point. What is called for, above all, is the cleaning of the Augean stables in power generation and coal production and transport. Talk of maximising the use of coal in place of oil can have any meaning only after this has been done. In fact, however, the chances are that, thanks to the still easy foreign exchange situation, the government will take the relatively painless path of contracting for import of more and more crude oil and petroleum products at exorbitant prices — all the while reiterating its faith in an energy policy.

Politics

Well Served by the Cow

VINOBA BHAVE ended his five-day fast demanding a total ban on slaughter of cows on Thursday just after the Prime Minister announced in the Lok Sabha that the government would introduce a bill to amend the Constitution to include cow protection in the concurrent list. The constitutional amendment, if enacted, will make it possible for the Centre to ram a total ban on the killing of cows down the throats of West Bengal and Kerala, which now permit the killing of aged cows. Thus the attempt at using moral force by the supposed saint of Paunar has been converted into straightforward use of the State machinery in support of a plainly obscurantist Hindu communal demand.

Just before starting his fast on Sunday, Vinoba Bhave was reported to have expressed the hope that people in all states would find inspiration from his fast to work for a total ban on cow slaughter. This rather immodest expectation was completely belied. In the two states of Kerala and West Bengal, the fast failed to evoke any popular response in support of the cause for which it was undertaken. Even over the rest of the country, the people by and large showed little concern over the fast, despite newspaper reports of the fasting Bhave's condition deteriorating, growing worse and causing concern.

In fact, apart from the inmates of Bhave's ashram and very small numbers of Sarvodaya workers in different parts of the country, the only people who were really exercised over the fast were the leaders of the various political parties. The Janata party president, Chandra Shekhar, rushed to Paunar and, we are told, engaged in hectic consultations with Vinoba Bhave and his associates as well as with Central leaders in Delhi before evolving the formula which enabled Bhave to call off his fast. From the other side, Indira Gandhi was actually on her way to Bhave's ashram when, no doubt much to her disappointment, the fast was broken.

The effort to make political capital out of Vinoba Bhave's fast is seen most clearly in the behaviour of Indira Gandhi and her party. The Congress(I) had adopted a resolution supporting the fast and Indira Gandhi had even called upon her partymen to undertake token fasts in sympathy with Vinoba Bhave's fast. Clearly, no effort was to be spared to cause as much embarrassment as possible to the ruling party and government. And now, pursuing the same objective, Indira Gandhi has declared that it is by no means certain that her party will support the government's bill to amend the Constitution to include cow protection in the concurrent list. The CPI(M), CPI and DMK have made known their intention to oppose the bill, but what will be vital is the attitude of the two Congress parties. In fact, the support of the Congress (I) in the Rajya Sabha will be critical.

Thus, while Vinoba Bhave may have denied Indira Gandhi some limelight by breaking his fast before her arrival at Paunar, he has still provided her with an opening for bargaining with the Janata party and the government. The opening must seem a valuable one at a time when her efforts to take over the other Congress have failed, when challenges to her authority in her own party have begun to surface and when she is faced with the threat of having the charges against her and her Emergency cohorts tried before special courts.

Foreign Companies

Unsuspected Allies

GOVERNMENT pronouncements on the subject of regulation of the activities of multinational corporations often give the impression that this is essentially an administrative matter. They ignore that such corporations, especially those which have been established in this country for some length of time, have close linkages with many segments of the economy and society. As a result, any government-enforced change in their activities is likely to have widespread repercussions and any policy towards the multinationals must also aim to cope with these repercussions. Two recent developments illustrate this point.

Safety matches is one of the industries in which it is the government's declared policy to encourage small-scale and cottage production and restrict, and eventually phase out, the operations of the only large-scale producer, a multinational company. As a step in this direction, the Budget for the current year had sharply raised the excise duty on matches produced in the large-scale sector while reducing that on hand-made matches. This has immediately met with the opposition of trade unions representing workers of the multinational corporation who have represented to the government that a part of the company's workforce may lose their jobs if the company is forced to cut production.

A second case in point is the government's recent decision to reverse its earlier policy announcement and permit foreign pharmaceutical companies to continue their existing loan licence arrangements for another year and even allow fresh such arrangements. Under these arrangements the pharmaceutical companies get items, for producing which they hold licences, produced in the plants of small drug units. The items so produced are, of course, sold by the foreign companies under their brand names and are included in their turnover. The advantage to the companies is that the small units' wage and other costs are very much lower and

they themselves can enlarge their turnover and profits without setting up production facilities and through what is essentially trading activity. In this instance it was apparently the opposition of the small drug units — whose plants are being used by the foreign companies — which compelled the government to reverse its earlier decision to disallow loan licence arrangements.

In both the above cases, the foreign companies concerned may well have used the workers in the one case and the small drug units in the other to try to secure changes in government policy to their advantage. But the two cases do underline the importance of fully taking into account the wide ramifications of foreign companies' operations in the country while formulating policies in regard to them.

Punjab

Plight of Migrant Labour

Amarjit Chandan writes:

THE phenomenon of exploitation of migrant labour — such as of Oriya and Bihari bonded labour by contractors, dalals and British tea companies in Assam and Darjeeling in the days of the British Raj — has recently emerged in Punjab. Agriculture in most of the districts of Punjab has taken to mechanisation. This should have resulted in surplus labour in the agricultural sector. But as a result of mass migration of Punjabi labour, skilled and unskilled, to the Gulf countries, there is scarcity of labour in Punjab. (The migration of Punjabi labour to America, East Africa and East Asia started in the early part of this century.) Another factor which may have contributed to the scarcity is the large-scale recuruitment of semi-literate and illiterate Punjabi youth into the armed forces.

The gap is being filled by Munda tribals from eastern Bihar, known in Punjab as 'purbias' (easterners). There indeed is a scramble for purbias. The reason is not only the scarcity of labour. The purbias are cheaper than local labour, and they can be made to work harder. They feel insecure in an alien place and are therefore more susceptible to the pressure of the jat employers. The employers even resort to giving them drugs like opium and hemp, etc, and the purbias often return to their native land as drug addicts. They do not get their full wages. The ruthless farmers often beat them and chase them away after extracting labour for a considerable period by paying a paltry sum and sometimes even paying nothing.

For the jat farmer these are important plus points for hiring purbias. But even these are not all the reasons for hiring them. The agricultural sector in Punjab has recently witnessed sharpening of contradictions between the jat employers and farm workers, who are by and large scheduled castes. These farm workers are getting organised and are demanding better working conditions and wages. Some khet mazdoor organisations of the CPI, the CPI(M) and some Marxist-Leninist groups are active in this area. The jats are of course not prepared to take this lying down. They have been using all possible methods to suppress the audacity of the 'untouchables'. By way of economic sanctions, the jats decide not to employ them as far as possible. They also resort to social boycott (naqabandi) of the scheduled castes. The social suppression has gone so far that harijan workers are not even allowed to ease themselves in the fields, which in most cases belong to the jats. They cannot collect fodder from the fields. When a boycott takes place, the harijan men, women and children live a terror-stricken life. The women are raped and men and children beaten at will. Agricultural workers in Punjab are putting up a resistance against this suppression, but this is yet to become a proper fight. In this situation the purbias have become handy to the Sikh jats.

Among the first purbias to migrate to Punjab from the Chhota Nagpur region of Bihar was one Birsa, who ten years ago arrived in a village in Hoshiarpur district. On his return to his native place the jat farmers asked him to bring more men and promised to pay him Rs 100 per man. In the process Birsa became a dalal. Two institutions emerged, one of the Punjabi dalal and the other of the Bihari dalal. The amounts that are paid to them, which have gone up with the rise in demand for migratory labour, are deducted from the purbia's salary.

Tanda Urmur, a town in Hoshiarpur district, is the main centre of agencies connected with import of labour. The Punjab and Bihar police are parties to this trade. The Bihar police get Rs 10 per head and the Punjab police wait eagerly for the arrival of the purbias at Jullundur and Ludhiana railway stations. Farmers from all over Punjab are these days camping at Ludhiana railway station to meet incoming trains from the eastern states.

It is ironical that the people who are subjugated to such inhuman exploitation are worshippers of Bhagwan Birsa Munda, a legendary hero of the Chhota Nagpur region, who 'waged a war against British colonialists and against local moneylenders in the late 19th century. The purbias remain unorganised and, therefore, weak. The parliamentary communist parties of Punjab do not take any interest in the issue, maybe because the purbias do not have voting rights in Punjab.

Sugar

Higher Prices with Higher Production

THE peak of the sugar season has been passed. But in view of abundant crop this season, government will have to induce, and if necessary force, the industry to continue crushing for the next 13 weeks. At the time of writing, 240 factories are working and sugar production by end of March 1979 had already touched 4.6 million tonnes, i e, 100,000 tonnes more than that in the corresponding period of the 1977-78 season.

Sugar prices have gone up all over the country in March, by between Rs 40 and Rs 80 per quintal, and in Bombay the retail price has moved up from Rs 2.20 to Rs 2.60 per kg. This has happened in spite of the fact that godowns are bursting with sugar bags and the industry has managed to secure a number of facilities from the government and the Reserve Bank.

Advised by its 'experts', the government committed itself to permitting industry to restrict monthly sugar releases. The quota for March had to be later increased and the current months quota has been fixed still higher. In spite of this prices have gone up. This is not surprising. While large quotas are released under government pressure, the industry is under no obligation to sell the entire quota within a prescribed period.

The industry's position has been further fortified by the Reserve Bank's instructions to scheduled banks to grant liberal credit to sugar mills, taking into consideration the position of individual factories. In any case, industry has enough pull over the disbursers of credit, whether these happen to be nationalised or private sector banks. With sufficient credit available, the urgency to sell disappears.

The government should, therefore,

ensure that the quota for any month is fully sold before the 15th of the following month. The summer months are the period of the heaviest demand for sugar.

News about export contracts for sugar is given out periodically, but it is never revealed at what prices the deals are struck. Government efforts to persuade industry to sell directly in the export market have proved a complete flop. Export prospects are not at all bright and the world market has been receding steadily. The 1973 commodity boom took sugar price to the dizzy heights of £650 a tonne in November 1974. After that the price fell to about £150 in 1976-77, £110 in 1977-78 and is currently ruling at £94 a tonne.

Export of sugar thus involves a sizeable loss. Neither industry nor any individual factory is prepared to bear this loss in the absence of government subsidy. Exports by the STC are quite different. The STC's losses on export of sugar are fully reimbursed by the government. Industry is, therefore, keen to press the government to export the full quota of 650,000 tonnes in 1979.

In addition, industry has started raising the scare of a severe fall in sugar production in 1979-80. Industry predicts a fall of at least a million tonnes. There is absolutely no basis for this kite-flying and yet it has got nation-wide publicity.

Rhodesia

After the 'Elections'

Ninan Koshy writes:

AT the end of the elections in Rhodesia, with the apparently impressive polling percentage of 64, Ian Smith, the Prime Minister of the illegal white minority government, declared that the 'fantastic result' should encourage the leaders of the 'free world' to recognise the new regime. He claimed that he had fulfilled all the conditions laid down by the 'free world' for legitimacy. His claim was duly supported by the other champion of the 'free world' in that area, the Republic of South Africa.

The first attack against the validity and legitimacy came from within the ranks of the government, from Sithole, one of the black leaders who had signed the 'internal settlement'. He alleged 'gross irregularities' in the election and demanded the appointment of a Commission of Enquiry. He could not honestly say that the rules were violated because there were hardly any rules in this game in which he had agreed to participate.

There was no electoral roll for the elections. The last census in Rhodesia was in 1969; even that was not a comprehensive one. The election in Rhodesia seems to be an object lesson on the role of statistics in politics. In March 1978 the official estimate of those elegible to vote (those above 18 years of age) was 4.8 million. By the end of 1978 the figure quoted by the government was 3.5 million. By the time of the elections the figure went down further and was officially given as 2.8 million. This is one of the advantages of having no electoral roll.

Officially more than 1.8 million people voted. This of course is 64 per cent of 2.8 million. But problems arose when officials reported that in several polling booths, like Mashonaland west and central, the percentage of polling was as high as 108. That elections were held over a period of five days, that no proof of identity was required (or available in most cases), that resident workers from Mozambique and Malawi voted, that indelible ink may not have been always indelible and that after all there was no electoral roll — all open up fascinating possibilities.

The censored and guided media made the necessary adjustments. It was always claimed that in Rhodesia 75 per cent of the blacks lived in Tribal Trust Lands (most of which are now under the control of the forces of the Patriotic Front). But by the end of March 1978 Western correspondents based in Salisbury reported that close to 61 per cent of blacks lived urban, white farming and mining areas and one of them therefore boldly added that "the demographic breakdown of potential black voters favours the transitional government rather than the guerillas".

The elections were held at a time when the Rhodesian army was making massive attacks on Zambia, Mozambique and Botswana, claiming that it was winning the war and 'finishing' Nkomo. It is significant to recall in the light of the present predicament of Sithole that he had stated before the elections that Nkomo should be invited to become President of Rhodesia/Zimbabwe. This was of course in a way responding to the propaganda by some followers of Bishop Muzorewa that after the elections there would be an alliance between Muzorewa and Mugabe. This propaganda obviously had effect on some sections of the voters. Also the claim that 'our boys' (the guerillas) will lay down arms before a black government.

More than 95 per cent of the country is under martial law. Nearly 10,000 armed men and women were mobilised to 'protect' the black population against the guerillas. The government 'urged' all employers to 'ensure' that all their workers voted. The private armies of Sithole and Muzorewa, trained respectively in Uganda and Libya, were at the polling booths and voters in many places were asked to show how they were voting.

Bishop Muzorewa now becomes the Prime Minister of Rhodesia under a constitution the provisions of which ensure continued white minority control over all the levers of power. The 'entrenched provisions' of the constitution guarantee the special privileges of the whites regarding property and white dominance over the administration of judiciary, executive, army and police. The judges who sent hundreds of blacks to the gallows continue with the same powers; the army and the police who terrorise, torture and kill the people have even enhanced powers. The constitutional provisions regarding these key sectors of economy and politics can be amended only by "a Bill which receives the affirmative votes of not less than 78 members".

And that is the crux of the matter, because all the black parties together — and they are not united — have only 72 seats. Constitutionally the whites who form less than four per cent of the population have 28 seats in a Parliament of 100. Of course, it was one man one vote except that the vote of one white person carried more than nine times the value of the vote of a black person. The majority of the people of Zimbabwe have rejected this formula for the perpetuation of white minority rule and that is the strength of the struggle of the Patriotic Front

In the coming weeks pressure will be increasingly put on the Western countries to recognise the Muzorewa government. Muzorewa has stated that the colonial power from which Smith seized 'independence' should take the lead by recognising Rhodesia and lifting economic sanctions. In Britain some Conservative leaders had earlier stated that if the elections in Rhodesia were fair and if the Conservatives were returned to power, they would recognise the new government in Rhodesia and lift economic sanctions. That attitude has begun to waver in spite of favourable reports from the team of observers sent by the Party. The question is not one simply of relations between a British government and a

government in Rhodesia, but involves relations with the Commonwealth countries, especially those in Africa and also Britain's relations with the USA. Labour leader Callaghan has stated that there will be another attempt at negotiations, if Labour is returned to power, implying that there will be no recognition There are already indications that several black countries will walk out of the forthcoming Commonwealth Conference if Britain recognises Rhodesia. For a decision on Rhodesia for the USA, the results of the British elections are apparently more important than those of the Rhodesian elections. The trump card that President Carter has for his black constituency which overwhelmingly supported him in the last elections, is the claim of a pro-Africa policy and he may find it difficult to sustain it.

Railway authorities or the various agencies handling goods at the two places either for themselves or for the private parties engaging them for the purpose.

LETTERS TO EDITOR

Porters of Howrah Goods Shed

I HAVE read with surprise some of the views expressed and observations made by Timir Basu in his article "Porters of Howrah Goods Shed" (December 9, 1978).

Obviously, Timir Basu did not have correct facts and figures at his disposal. At the Howrah Goods Shed, the total number of men engaged in handling work is between 900 and 950, but of these, not even 400 men including tindals, markingmen and supervisors work under the railway handling contractor The rest work under the Food Corporation of India and different outside agencies In fairness to the present railway handling contractor, it should be stated that although the workmen under him are not so liberally paid as the workmen engaged in jute and engineering industries of the Howrah-Calcutta area, the former, in conformity with the provisions of the Contract Labour (Regulation and Abolition) Act, 1970, are in full enjoyment of the same wage rates, holidays and hours of work as are applicable to the workmen directly employed by the railway on similar kind of work in the Howrah-Calcutta area. Irrespective of the working hours officially notified for the Howrah Goods Shed, none of the workmen engaged by/under the railway handling contractor is made to work for more than 7 hours in the course of a day and without exception, they each get statutory weekly rest after six days' work It is not true that they are all made to work for 16 hours in a day through use of musclemen or by applying strong men tactics, as alleged in Timir Basu's article. Whosoever works under the contractor works under his direct control.

Another gross distortion of facts is that at the Howrah Goods Shed there is no first-aid arrangement for the contractor's men It may be news to many that these men, if injured on duty, are given by his contractor-employer not only full medical aid but also compensatory wages and allowance for the period for which he remains off-duty under medical advice

Timir Basu does not seem favourably disposed towards the Howrah E R Goods Labour Contractor's Union of which I am the secretary. This Union, which was formed and registered in 1972, commands a membership of a little over 300 men, which means that more than 75 per cent of the workmen engaged under the railway handling contractor are its members.

I am also the secretary of the Howrah Goods (Eastern Railway) Workmen's Co-Operative Labour Contract Society Formed and registered in 1974, this Society which holds the contract for handling parcels at Howrah has nothing to do with the goods handling contract at Howrah held by Messrs Dey and Agarwala. Because of this Society's acknowledgedly brilliant performance as a parcels handling contractor at a busy station like Howrah it hopes to get also the goods handling contract at Howrah

Regarding the Railway Goods Handling Labour Contract Mazdoor Union, the less said the better Though claiming to be a CITU-backed Union, it is, in fact, an organisation of vested interests with a membership of not even 40 workmen and its two principal office-bearers interest themselves more in estrangement of relations between labour and management at the Howrah Goods Shed than in the much-professed collective welfare and economic betterment of its members

In Timir Basu's article, there is a mention of some incidents as also of prevalence of certain corrupt practices in the Howhah and Ramkistopore Goods Sheds But these things in no way concern either my Union or my Society. They mostly concern either the local

China and Viet Nam

IT was amusing to read Lajpat Rai's letter (April 7) commenting on my article "Socialism by One Country" (March 3). He is of course right that I do not see the conflict in Indochina in a "simple and straightforward" way as your editorial had done. His perspective and mine are so different that it would not be possible to settle the differences in just one letter.

However, it is quite clear that he has not either fully read or understood my article. To cite just one example, quite contrary to Lajpat Rai's interpretation, I have categorically stated in the article that as regards "altering the situation in Kampuchea", "that does not seem likely either". I had also, added that it was not possible to "suggest an answer which would, in operational terms, explain the Chinese move". Lajpat Rai's difficulty seems to be the same as Deng's, in that he also cannot hear what other people are saying

As regards my assessment of Deng, I had said that I was "not sure" whether the extreme nationalist element (which was once described by no less a person than Zhou Enlai as "Han chauvinism") was altogether absent from his thinking Surely, a doubt of that kind should be permissible As regards his being revisionist, I did not in that article nor do I intend to in this letter, call him anything like that It is my understanding that "a great revision is going on in China" and it would be hard indeed to argue that it is otherwise In any event, it is just as well to remember that Mao Dzedong had called him a capitalist roader once and there is no evidence that he had revised his opinion ever If there is indeed a provocation to describe Deng one way or the other, I would much rather be in Mao's company than in Rai's But there is no such provocation — not yet anyway

The Coalition Idea

Romesh Thapar

THE internal crisis that continues to weaken and destabilise the Janata governments in the northern states is now taking on a character which makes it necessary to question the viability of this mess of a party. Over several months, we have been trying to convince ourselves that the five constituents of the Janata "party" will manage a working partnership and fuse into a single organisation before the next general elections. Even the President has spoken of the "miracle" of the Janata party's existence. By the looks of it, all this theorising is about to explode in our faces.

The RSS question has assumed such proportions in the Janata "party" calculations that we seem to be headed for a split. It is most doubtful that the energetic Jan Sangh constituent will agree to any restrictions on its RSS connections because the overwhelming majority of its members are also active in the *shakhas* and in conspiratorial culture. The Jan Sangh/RSS attempt to capture the Janata "party" through an intensive membership drive has apparently angered all the constituents, particularly the BLD of Charan Singh. Actually, Charan Singh is so oppressed by the failure of the party he was instrumental in founding that he now talks of the need for an honest coalition at the Centre and in the states ruled by the Janata conglomerate.

Admittedly, the problem of conducting elections in a party ridden with hidden intrigues and pressures of its five constituents has brought matters to a head. Our squabbling politicians are now convinced that no democratic party is possible within the existing framework where each constituent is openly and crudely manoeuvring for vantage positions. Thoughts are turning to the idea of coalition governments created by carefully structured agreements between the leaderships of the various parties, with each party committed to disciplining its own following in the context of those agreements. If Charan Singh pushes harder, we may see a rather rapid crystallisation of coalition thinking. Interestingly, a coalition might even defuse the present RSS tangle.

The continental politics of India have developed their own peculiarities. One of the prominent aspects being commented on is the regional manifestation of certain parties, including the Communist, and the regional consolidation that is resulting. While the break-up of a single continental party like the Indian National Congress was inevitable after its failure to carry forward and implement a model of growth upon which it was mobilised, it was absured to imagine that the mess known as the Janata party would develop a continental *elan* and replace the Congress party. However, what we have inherited is not unhealthy — every party enjoying some power somewhere on the sub-continent at a time when federal relations need reviewing and adjusting in the interests of a more democratic and participative system of governance.

It is a situation which is not to be scoffed at. An all-powerful Centre with subservient state governments — the dream of Indira Gandhi and her son — would have suffered the fate of the Shah's regime in Iran, but on a horrendous scale. Today, the confusion at the Centre gives us the opportunity to reflect the multi-party growth of India in a coalition system at the Centre with the consensus technique as a solid continuity. The demoralisation which often overtakes the political scientist rooted in Western theory has really no basis. The Indian reality has always been different. Was not the Indian National Congress an amorphous, consensus-making "coalition". It was fortunate in its shared experience of the freedom struggle and its nationally acclaimed leadership. The coalitionists of today are not without shared experiences and can certainly throw up a leadership capable of commanding national attention.

The political culture of coalition functioning may not take too long to mature so long as we do not import the polarising notions of Western politics. For example, a coalition government at the Centre should strive to reflect a working collaboration with the CPI(M) in Bengal and with the Congress in the South. In other words, we must devise the disciplines and frameworks of coalition functioning in a continental setting. Naturally, a special stress will come to be laid on political mobilisation which will become the instrument of making consensus decisions more dynamic and directed at modernising and humanising society.

Radical formations can, of course, decide the course of coalition politics. If the present challenge is viewed merely as an opportunity to project the united front tactic to infiltrate the "landlord-bourgeois" fortress, then a new sort of polarisation will result. But, and this is important, if responsible Left leadership bases itself on a full understanding of the complexities of continental revolutions and determines to prevent the fragmentation of a "multi-cultural, multi-national" Indian society, a qualitatively different pattern of politics would emerge. Political mobilisation, consolidated in government power at certain points, would profoundly influence the consensus on policy. A survey of even the Janata party's two years of governance cannot but highlight the unshakeable commitments to certain democratic and egalitarian thrusts irrespective of who rules. The politicised millions make this *sangham* inevitable.

However, even as we view the disarray among the main contenders for national power, the Janata and the Congress, it is of paramount importance that the machinery of State, civil and military, be insulated against the political disruptor and destabiliser The manner in which the police have been misused, and the growing assault on the independence of civil servants, needs immediate attention — and by the seniors in each *echelon*. The politician, and this includes the elected animal, must be firmly put in his/her place. And this means that someone among the politicians has to do the job. If only the Morarji Desais and Vinoba Bhaves of our world could get themselves hooked on to real issues we might begin moving.

Growth plus Sophistication

Hamsavivek

KAMANI ENGINEERING CORPORATION has well maintained during 1977-78 the steady progress achieved in the preceding few years. Supply of fabricated towers and connected material continues to be the company's major activity which accounted for about Rs 24 crores of revenue. The construction activity both in India and abroad increased significantly and brought in revenue of Rs 14 crores which was more than double that of the previous year's Rs 6 crores. The company's construction competence has further widened with the commissioning, for the first time in India, of the sophisticated and high value tension stringing equipment for the execution of 400 KV bundle conductor lines. In the field of heavy civil engineering, KEC successfully met the revised completion targets on 210 MW power station at Nasik for MSEB. A record achievement was the completion and shipment in time to the buyers' satisfaction of certain urgent export orders from Libya and Iran in a short period of 4 to 6 months against a normal period of one year. The rolling mill unit at Jaipur also experienced increased activity with 68 per cent rise in production over the previous year. It developed rolling of special transmission line tower sections of size 45 x 45 x 4mm and 40 x 30 x 4 mm. The company's tower testing station has assumed greater significance as a national tower testing centre, since more than 30 per cent of tower tests were related to requirements of other manufacturers. In order to keep pace with international technological development the company has decided to expand its testing facilities by installation of additional test bed with facilities for prototype tower testing for high voltages of 750 KV and over.

On sales of Rs 37.71 crores against Rs 31.28 crores, KEC has earned a gross profit of Rs 6.61 crores against Rs 5.94 crores. The latest figure has been arrived at after providing Rs 1.65 crores for construction contingencies. The directors have also adopted the written-down value method for depreciating the company's fixed assets. The change has necessitated on additional depreciation to the extent of Rs 1.17 crores. In view of the huge losses carried forward, the directors feel that no tax would be payable against the profits including those of 1977-78. However, for meeting the uncertainties arising from legal decisions, they have made a provision of Rs 2.95 crores for taxation as a precautionary measure. Net profit has therefore dropped from Rs 5.48 crores to Rs 1.69 crores. The unchanged dividend is still covered 6.7 times. The company is executing two large turnkey projects, one in Libya and the other in Iran. The Libyan contract is expected to be completed during 1980-81. Meanwhile, a further contract of Rs 13 crores has been signed in December last for 220 KV transmission lines. In Iran, the construction operations have not been running smoothly, primarily due to non-fulfilment of contractual obliga-

tions by the purchaser. With the recent political upheaval there, the position became totally fluid. The situation is under constant review and further execution of the remaining part of the work will be taken up as and when continuity of operations is feasible.

BOOTS COMPANY (INDIA) has achieved improved performance, which has enabled directors not only to step up dividend by 4 points to 22 per cent but also propose issue of bonus shares in the proportion of 1:3. Sales increased by 15.6 per cent from Rs 11.09 crores to Rs 12.82 crores and gross profit expanded by about 30 per cent from Rs 1.67 crores to Rs 2.16 crores. Net profit came to Rs 73 lakhs against Rs 55 lakhs of the previous year. Dividend was covered 1.67 times. The company enhanced its bulk drug production by setting up and commissioning the new chemical plant at Ahmednagar in April 1978. The ratio of production of its own bulk drugs to its total production for 1978 was 1:3, as against 1:5 prescribed for foreign-sector drug companies under the new drug policy. The company has adequate knowhow facilities and resources to meet the requirements of Insulin, Diloxanide Furoate and Ibuprofen — all bulk drugs — in the Sixth Plan period. It has also planned for a substantial additional investment in setting up a new research unit for basic research and expansion of quality control and development laboratory facilities at its pharmaceutical factory at Sion in Bombay, besides a new chemical laboratory at Ahmednagar. Total capital expenditure on these projects would be over Rs 2 crores. N S Phatarphekar, chairman, says that the company's performance continues to be satisfactory with sales for the first two months of 1979 being 27 per cent ahead of those in the same period of 1978. Commenting on the new drug policy announced in March 1978, he observes that this would adversely affect the utilisation of the present capacities, capabilities and resources which could be put to use for achieving the objective of more than doubling the country's pharmaceutical production from about Rs 800 crores in 1978 to Rs 1,900 crores by 1982-83

BAJAJ TEMPO is updating its technology by obtaining knowhow from Daimler-Benz of West Germany for manufacture of the latter's four-cylinder diesel engine OM 615. This high-speed diesel engine running at 4,200 RPM develops 60 HP and is being used by the collaborators in their versions of light commercial vehicles and cars. This engine, installed on the Indian company's vehicle, will increase its load capacity and reduce fuel consumption. Meanwhile, the company is going ahead with the expansion of capacity from 4,000 vehicles to 12,000 vehicles and in addition 6,000 diesel engines per annum. This has been divided into two stages. Machinery and equipment required for the first phase covering 8,200 vehicles and in addition 3,400 diesel engines have been installed and full utilisation of this capacity is expected to be achieved by September 1980. The company will soon apply for a licence to import machinery for the second phase which is proposed to be completed by 1982-83. The research and development department is developing a tractor-trailer combination of the company's vehicle. It is also engaged in developing a new vehicle, particularly for use by farmers, to replace the bullock-cart. According to the management, this vehicle will not only be competitive with the bullock-cart in capital investment but will be much cheaper in operation and should have a vast market in the country. The department has also undertaken the development of a battery operated electric vehicle in co-operation with Kirloskar Electric of Bangalore. During the year ended September last, the company produced 5,874 three-wheeler and four-wheeler light commercial vehicles and 1,811 diesel engines for other purposes, as against 4,819 and 1,625 numbers, respectively, in the previous year. Sales expanded from Rs 21.52 crores to Rs 26.80 crores, but gross profit shrank from Rs 3.03 crores to Rs 2.62 crores, showing considerable diminution of margins. Net profit, however, is only slightly lower at Rs 1.31 crores (Rs 1.36 crores). Dividend has been reduced from 18 per cent to 10 per cent, which in effect is equivalent to 20 per cent as it is payable on the capital as doubled by issue of bonus shares. The distribution is more than three times covered.

EXCEL INDUSTRIES has had another good year to September 30 last, with higher sales and earnings. Dividend is maintained at 18 per cent on an enlarged capital resulting from a bonus issue and is still well covered. What is more, this performance is being well maintained even in the current year. The company's plants at Bombay, Bhavnagar, and Roha are working satisfactorily. Sales during the first three months were Rs 3.76 crores, compared to Rs 2.59 crores in the same period last year. Demand for the company's products in the rural areas is on the increase. Meanwhile, firm foundations are being laid to ensure future growth of the company's business. The pilot plant for manufacture of Endosulfon is working satisfactorily, and the quality of the product has come up to the expectations. The main plant will go into production this year. The research and development division has completed the process for manufacture of a 'flow improver'. This product is used by all petroleum companies as an additive for transporting crude petroleum through pipes. The product has been tested and its quality found satisfactory by the clients. The company is now seeking an industrial licence for 2,000 tonnes per annum. The quality and prices of export items manufactured by the company compare favourably with those of similar products manufactured abroad Last year, exports expanded from Rs 18 lakhs to Rs 113 lakhs and efforts are being made to further increase exports. Punjab United Pesticides and Chemicals, a joint-sector company promoted by Punjab State Industrial Development Corporation, in association with Excel, to manufacture Malathion, commenced production in April 1978. It has paid a maiden dividend of 4 per cent in the first year of production. Excel has completed delivery of machinery against its agreement with Hindustan Insecticides for a turnkey project for manufacture of Malathion and the plant is being erected.

ANDREW YULE, well known in engineering and lubrication technology, power generation and tea manufacturing, has now entered the field of conveyor belt manufacturing. The first roll of conveyor belt has recently come out of its plant located at Kalyani in West Bengal. With a licensed capacity of 1,900 tonnes, this plant, when commissioned in July next, will be the largest conveyor belt manufacturing unit in India capable of producing conveyor belting upto 1,600 mm width to meet the demand for increasingly larger quantities and heavier loads of material. These conveyor belts are being manufactured to ISI, ISO, and BS specifications. The company has already secured substantial orders from some of the largest organisations in the country including TISCO, Bokaro and Durgapur steel plants, Hindustan Copper, Hindustan Coal Washery, FACT and Andhra Cement. The plant will soon start producing fan and vee belts.

The Benor System

'Nijanyanupi'

THE strategy for Indian agricultural development evolves through sudden dialectical transformations and not by a continuous smooth progression. At any given period there is only one authorised version of reality. One has to accept this or be a heretic, but there can be no modified version of it. Progress is very much like the present view regarding the evolution of scientific theory, namely, by a change of paradigms, one paradigm being replaced by another; one does not evolve into the other. The replacement comes about not by the pressure of internal evidence but by an act of intuition. In the case of agricultural development policies this intuition has been generally foreign and not indigenous. There has to be an external discovery of an internal truth.

The last version of the truth which had held the field for two decades was received in the 1950s through the Ford Foundation and Douglas Ensminger and was based on the US experience of extension. Consistent with the fall in the status of the Big Powers during the last two decades and the replacement of bilateral aid by multilateral assistance, the latest truth has come from the World Bank through the person of Daniel Benor (see note at the end). But the process is the same. A prophet coming with a new message, a message derived from foreign experience and backed by foreign aid — at that time the Ford Foundation and now the World Bank. One remembers too that the first budget of the Community Development Blocks used to have a column for the dollar component. We have become more sophisticated since then and foreign aid is now laundered by the time it reaches the project concerned. There is the same advancement internally and travel externally for the zealous convert and the same expensively produced literature with photographs from similar model countries – at that time Taiwan and Japan, now Thailand and Turkey; the same photographs of the model farmer, then called a progressive farmer, now identified as a small farmer, standing on the same grassy field, one half showing the lush results of the message and the other half showing the misery of the existing indigenous practices. One cannot help a feeling of *deja vu*.

Undoubtedly, there are some extremely useful and valid aspects of this new system. It improves what one might call the vertical co-ordination by more frequent meetings of the different levels. It breaks up into small time spans what was once called the calendar of operations and thereby ensures more faithful transmission of the relevant message. It attempts a rationalisation of the existing staffing pattern, a process very necessary in the case of the Agriculture Department because of the confused legacy left behind by a plethora of Centrally Sponsored Schemes. The very nature of these schemes is such that it encourages unco ordinated and in fact unnoticed continuance. At the time of their inception not much notice is taken of them by the rest of the administration, because they are usually smuggled in by a conspiracy between the Department at the state level and the Ministry at the government of India level by, what may be called, an act of seduction between the two consenting parties, if that is not a contradiction in terms. These schemes come to notice five years later when their financing has to be picked up by the state government very much like a baby boom in any year hitting the school structure quite unawares five years later. Fortunately, in our present arrangement this is the time a benign Finance Commission makes its appearance and makes the transition less painful. Bct it still remains haphazard and unplanned. It is therefore useful that an overall view is taken of all the manpower available as a legacy of these schemes and that this manpower is rationalised.

These are the positive aspects of the new system. They are however not the basic aspects. The basic aspect is that the multipurpose Village Level Worker is converted to a purely agricultural extension worker and is integrated into the line of command of the agricultural hierarchy, as apart from the Fanchayati Raj hierarchy to which he at present belongs. This approach is diametrically opposed to the previous approach. At that time we started with a situation which was in fact what is now recommended, namely, that there was a purely agricultural departmental hierarchy ending with the agricultural field worker. It was then the received wisdom that this single line approach was practically inconvenient and theoretically inappropriate. The farmer had to be saved from the trouble of going to different agencies for different purposes. It was found that mere agricultural extension lacked adequate motivation; the quality of life had to be improved through a Community Development project so that the basic motivation for material advancement was engendered. It was against this theoretical framework that a multipurpose worker with certain basic training upto a particular level was considered. He was then placed within a framework of the Panchayati Raj institutions, as apart from the purely bureaucratic hierarchy of the Department because, again, it was felt that both efficiency and motivation required community involvement through these institutions.

The present approach moves away from this entire approach. We are back to the unidimensional functionary constituting part of a single line administrative hierarchy. It is specifically recommended that credit and inputs should be separated. It could well be said that we have arrived at the same points as before but at a dialetically higher level. But this is taking place at a time when the elements of this thesis are not accepted in the rest of our developmental strategy. We are just now talking again of integrated rural development. We have just received the report of the Ashok Mehta Committee on Panchayati Raj institutions. Incidentally, both these are matters dealt with by the same Ministry at the Centre. Yet it does not seem to have occurred to them that there is a conceptual contradiction in the basic *hypotheses of these different approaches*.

The Benor system is described as being remarkably suited to our conditions and methods of work. There is a great deal of truth in this observation. There is an interesting chart in the World Bank publication on this system which gives the organisational pattern. There is a pyramid here of five levels of officials set on top of the basic level, which is the farmer. This is a perfectly hierarchical system which suits our genius ideally. The hierarchy is complete not merely in its salary

and status but also in transportation. The subject-matter specialist has a jeep to move about; the Agricultural Extension Officer has a motor cycle; the Village Level Worker has a cycle; and the farmer of course walks to his farm. The hierarchy is also pleasing because it not only indicates the path through which the information moves down from one level to another but it also represents the ladder which assures the bureaucrat of his opportunities for going up. No doubt it is argued that a major part of this structure will be met by rationalisation of the existing manpower; but it can be safely deduced from Parkinson's law that this will necessarily also result in a great expansion of the agricultural bureaucracy. This may perhaps be a desirable end in itself considering the problem of educated unemployed; but how far it serves the farmer is still a moot point. This is only one part of the bureaucratic apparatus. With credit and inputs being separated they will build hierarchies of their own. A high ratio of service personnel to actual producers may be all right at a later stage of development when the percentage of those engaged in agriculture falls; but with our existing situation the high ratio will mean an unconscionable proliferation of the bureaucracy.

The different techniques recommended in the Benor system are no doubt useful in making the transmission of knowledge within the five levels of the official pyramid smoother and more efficient. But the real problem is not transmission within this part of the pyramid but communication between the end point of this structure and the farmer himself. At that point there is a Communication Gap. There is no assurance in this system, any more than there was in the previous one, that this gap will be filled more efficiently. Therefore, while the Benor system may bridge the Transmission Gap within the bureaucratic structure, it does not give us any automatic assurance that it bridges the Communication Gap between the bureaucracy and the farmer.

This whole structure is in keeping with our genius from another point of view. It is a structure in which there is a neat division between the teacher and the doer. The basic hypothesis of our society has been a slight modification of the well known proverb that 'the teacher does not do and the doer cannot teach'. In this system knowledge is being passed on from one non-doer to another with the ultimate idea of influencing the doer. The farmer himself is not a homogenous entity. He may well not be the doer himself. The tragedy or the comedy of it can be seen by one example. There is an illustration in the techniques to be taught of how to hold a seedling while transplanting it. One can imagine how successive officials must be commuicating this knowledge from one to another when none of them has ever transplanted anything. When the Village Extension Worker comes to the farmer the farmer may also not be the person concerned. Very often it would be a woman labourer who does this work. Can the Village Extension Worker really teach her how to do it correctly? Yet a hierarchy of officials are constantly looking over the shoulder of the farmer. The whole system can be described as Supervised Farming. In some ways it reminds one of the famous American experience of Vietnamisation. The farmer being the foot soldier supplied by the natives, we provide the logistics and the advisers, the jeeps and the extension officers; but the dirty work has to be done by the foot soldier. Continuing the analogy one only hopes that the statistics quoted in the literature do not have the same degree of credibility as the body counts.

One can understand a system of this kind where the teacher and the doer are two ends of a scale and in between we get a series of persons who are varying proportions of teacher and doer; as we go down the scale, the percentage of teacher goes down and the percentage of doer goes up. But it is a scale in which mobility is possible, not merely of knowledge from the top to the bottom but also persons from the bottom to the top. It is here that the crucial difference arises in our system, since at the bottom of the administrative pyramid, at the point of contact with the farmer, there is an unbridgeable gap between the teacher and the doer. It is this gap that makes real progress difficult. Bernal has aptly commented on this: "The conditions of early civilisation led to a division of classes which put the scientists among the clerks on the side of the rulers, while the manual farmers were only a grade below the peasants and were often themselves slaves. That division has persisted to this day and its final breakdown is only beginning. Meanwhile for long periods of time it condemned science to sterility and technique to repetitive stagnation, while radical advances came only rarely." (J D Bernal, "Science in History".)

The Benor system, even if it succeeds, makes the last teacher in the chain a better teacher but does not bridge this gap. Benor, himself may not have considered this as a part of his task. But the Indian planners cannot again bypass this problem or shirk their responsibility. The issue is the dichotomy between theory and practice; the class division between teacher and doer. To quote Bernal again: "The great advances recorded seem very largely due to a closer fusion of theory and practice ... the social fluidity of the time that allowed a coming together of craftsman and scholar, sometimes a complete merging of the two" (*ibid*). It is that 'social fluidity' we need. Unfortunately, the fanfare accompanying the Benor system may help cloud this basic issue.

Note

For those not familiar with the Benor system the following excerpts from "Agricultural Extension: The Training and Visit System" by Daniel Benor and James Q Harrison will give a broad idea of its main features:

Reforming Extension Basic Guidelines

Unified Extension Service

. . Perhaps the most essential management principle to be followed is to establish a single line of command from the governmental agency responsible for agriculture to the field level extension worker. Unless this agency (in many cases the Agriculture Department) also has full administrative control of the extension service, it is not possible to carry out extension systematically and effectively. The concerns of other agencies would continuously interrupt the programme of work

All agricultural extension activities should be combined into a unified extension service

Extension Exclusively

Extension personnel should devote all their time exclusively to professional agricultural extension work..

Systematic Training and Visits (T and V)

. Briefly under this system schedules of work, duties and responsibilities are clearly specified and closely supervised at all levels The number of farm families per field-level extension worker is set at a manageable level. A specific schedule of visits to farmers' fields is rigidly followed. The ratios of supervisory staff are such that close supervision is easy. Frequent (weekly or fortnightly) one-day training sessions for field level extension staff are an integral part of the system.

In these training sessions, the extension agents are intensively instructed in the three of four most important recommendations for the forthcoming one or two weeks of the crop season

Imitable Contact Farmers

. The messages of the extension service should be focused mainly on selected contact farmers who will assist in spreading the new practices to most farmers in the area quickly...

[illegible] to ensure that the [illegible] of the supply agencies and the extension service are clearly delineated. The extension service should not be responsible for ensuring the availability of inputs, filling in loan applications, or collecting debts. These are the jobs of the supply and credit agencies.

Within this separation of responsibilities in mind, effective co-ordination [illegible] the extension and the supply agencies.

Physical and Personnel Requirements

... For this reason, there should normally be a vehicle for each SDEO, Assistant SDEO and SMS. The vehicle would be government owned and maintained. Travel allowances would cover meal expenses and other incidental costs.

NEW DELHI

Dual Prices for Foodgrain Procurement?

B M

WHILE the Civil Supplies Minister, Mohan Dharia, is waxing eloquent about his massive and enlarged production-cum-public distribution scheme which is proposed to be launched in July this year, the Food and Agriculture Ministry is working quietly to reduce as far as it can its commitment to operate procurement and public distribution of foodgrains — the most important commodity of mass consumption and one in which public distribution has been organised on a fairly extensive scale during the past many years.

It is being argued with much gusto within the Food and Agriculture Ministry that the only role that the State should play in foodgrains trade is that of enforcing a measure of discipline on private trade This it has the means and the ability to do with the buffer it has with it. For the rest, private trade is actually more efficient and serves the consumer better than official agencies. The time has, therefore, come to gradually withdraw from foodgrain trading This is a far cry from the days when the government, in the face of acute scarcity conditions, had launched its wheat wholesale trade takeover experiment and even after precipitately abandoning it, had still retained a major interventionary role in foodgrains trade.

The idea being canvassed is that foodgrain procuremenut and public distribution are becoming too costly a business for the government and that something must be done to prune it so that the burden of subsidy can be contained within manageable limits. This obviously cannot be done if procurement and public distribution are maintained on the present scale, especially because there is no question of reducing the procurement price and on the contrary, strong pressures for yearly increases in procurement price have to be reckoned with. The Food and Agriculture Ministry is fully in tune with this sentiment. It is equally difficult politicaly to keep on raising the issue price to consumers so as to neutralise the effect of increases in the minimum procurement price on the budget. The only way out of this difficult problem, therefore, is to try to reduce the Government's commitment at both ends of this operation. It is also argued that so far as the surplus farmers are concerned, they are now in a position to take care of their interests in the market, especially because they can always fall back on the public purchasing agencies for the disposal of their surpluses at the minimum procurement price fixed by the government.

There is also another problem that is worrying the Food Department as well as the Food Corporation. Both find themselves extremely unprepared for the rush of wheat from yet another bumper harvest to the markets this year. The railways not equal to the task of transporting grain from the producing centres to the deficit areas. The problem has been further aggravated because enough gunny bags are not there and are not likely to be available. This situation is attributed to the prolonged strike in the jute industry. It is felt that something will have to be done to moderate the demands on the public agencies for the purchase of grain which the farmer brings to the markets. The lifting of zonal restrictions on movement of grain helped in this direction last year. Anther decision has been now taken to the same end. It has been decided to allow the flour mills to make their purchases directly from the producers in the open market and not so insist on their buying only from the public agencies. It is expected that this may by itself help to take care of at least a million tonnes of wheat which otherwise would have had to be bought by the public purchasing agencies.

Another device which has been proposed is to induce the producers who are in a position to do so to hold back their stocks and not to rush to the market immediately after the harvest. A scheme has been drawn up which will give suitable incentives for holding back stocks by way of storage charges and interest which the public agencies will reimburse as and when the grain is offered to them. This scheme is expected to keep out of the market at least another million tonnes of wheat which the public agencies may otherwise have been obliged to purchase in a rush. With the freedom given to flour mills to make direct purchases and this scheme, it is estimated that the public procurement agencies may be able to restrict their purchases to just about four million tonnes in this year's wheat marketing season. So far as the offtake from the public distribution system is concerned, it is also expected to decline by about 2 million tonnes, i e, from about 9 million tonnes last year to 7 million tonnes. As a result the burden on the budget will be moderated to that extent in spite of the small rise in the procurement price of wheat granted this year.

There is another aspect of the new scheme for payment of a premium price for holding back stocks which deserves notice.

The vast majority of the farmers have hardly any marketable surplus and whatever little they have has to be sold by them in hurry after the harvest to meet pressing obligations and consumption needs. It is not likely, therefore, that they will be able to hold back very much to take advantage of the deferred procurement scheme. The rich farmers, however, can take advantage of the scheme. In any case, they try to phase out the marketing of their surpluses to maximise the sale price for their stocks during the lean season With the assurance of a premium for holding back their stocks, their bargaining position in the open market will be strengthened The scheme of deferred procurement will thus serve to provide a good cover for raising the minimum support price for them to levels higher than will be available to the mass of the peasantry.

THE ECONOMY

Money-Price Spiral

(By a Special Correspondent)

BANKING and monetary statistics have now become available for the full financial year 1978-79, except for a day's difference — that is, the figures now available are for the last Friday of the financial year, March 30, and not for March 31. In 1978, March 31 also conveniently happened to be the last Friday of the year. A series of adjustments are made in Central and state government finances on the last day, or the last few days, of the financial year before the government accounts are closed. In the last few years, the government has also resorted to accounting gimmicks such as postponement of payment of bills to the following year so as to show a lower budgetary deficit. Two other factors also seem to have come into play of late.

One is that the bureaucracy has generally failed to make a correct assessment of the likely receipts and expenditures till the very last minute of the financial year. This is evident from the fact that the budgetary deficits of the Central government as they finally emerge do not seem to have any relationship with even the revised estimates. For instances, the revised estimates had placed the budgetary deficit of the Centre in 1977-78 at Rs 975 crores, but it has now turned out to be Rs 834 crores. The budget estimate of deficit in 1977-78, it will be recalled, was Rs 615 crores. For 1976-77, the budget estimate, the revised estimate and the final accounts figures of deficit were Rs 328 crores, Rs 425 crores, and Rs 131 crores, respectively.

The second factor is that public sector expenditure programmes have lost their purposefulness and direction. As a result, enormous resources get mobilised in financial terms but delay in formulating and implementing investment projects creates a situation of abundant liquidity with Central and state governments at the end of each financial year, which in turn results in the squandering of resources through inflated project costs and expenditure programmes. Every year there is a backlog of Plan expenditure, both at the Centre and states, and yet every year gigantic resource mobilisation efforts are undertaken. As a result, the years roll by without there being much tangible impact on production, employment and investment.

Take 1978-79, the first year of the so-called rolling Plan, 1978-83, which has promised removal of destitution and chronic under-employment within ten years. There has occurred during the year expansion of the official money stock (M_1 to the extent of Rs 3,330 crores (18.2 per cent) which is almost Rs 1,000 crores more than the expansion that had taken place in 1977-78 (Rs 2,357 crores, 14.7 per cent). This is not a new phenomenon either. In 1976-77, when the Emergency was in force throughout the year, the increase in money supply had been 20.3 per cent, the highest rate of increase recorded in any year since independence. In absolute terms, the expansion had been Rs 2,700 crores. In the three years from 1976-77 to 1978-79, Rs 8,387 crores of additional money supply has been pumped into the economy, an average rate of Rs 2,800 crores per year, raising the total money stock from Rs 13,325 crores at the end of March 1976 to Rs 21,710 crores on March 30 this year. There is now general agreement among monetary theorists that as a surrogate for the trends in actual or potential national expenditure, the narrow money stock measure, M_1 (currency plus withdrawable demand deposits with banks) is insufficient and at times even misleading. More appropriate for this purpose is the Reserve Bank's concept of M_3 (M_1 plus time deposits with banks). Taking this measure, in just three years monetary liquidity has expanded by Rs 17,158 crores (over 76 per cent), at an average of Rs 5,720 crores per annum, from Rs 22,480 crores three years ago to Rs 39,637 crores. In the preceding five-year period, which too had been a period of large expansion in monetary liquidity, the increases had been Rs 6,004 crores in M_1 and 11,522 crores in M_3 — an annual average of Rs 1,200 crores and Rs 2,300 crores, respectively.

Such vast expansion of monetary liquidity is bound to have tilted the distribution of purchasing power further in favour of the top five or ten per cent of the population. This is strongly suggested by the fact that some of the 'real' instruments through which at least a part of the benefits of larger financial liquidity could have been shared by the mass of the people have shown no commensurate improvement. Take the case of employment in the organised sector, which absorbs directly and indirectly the bulk of the benefits of additional monetary liquidity in the system. During the three years when M_1 rose by 68 per cent and M_3 by 76 per cent and when bank credit to the industrial sector is estimated to have risen by over 50 per cent, employment in the organised public and private sectors together rose by just about 9 per cent. Industrial output rose by about 22 per cent, and that too because of a large 9.5 per cent rise in 1976-77, agricultural production by 8 per cent and national income by 13 per cent.

It can be argued, as in fact it is being done, that too much need not be made of this wide gap between monetary and credit expansion and growth of the economy in real terms, since commodity prices have been more or less under control. However, it is not true that there has been no pressure on prices. The government has managed to keep prices of primary commodities broadly stable at a considerable cost in terms of budgetary subsidies and outlay of foreign exchange resources. Earlier, it had also resorted to unjust and inequitous masures like restrictions on wages, dearness allowance and bonus of workers for this purpose.

Secondly, the lagged effects of the uncontrolled expansion in monetary liquidity have begun to be felt in the commodity markets. The wholesale price index (base 1970-71 = 100) climbed to 194 in the second week of April as compared with 183.6 in the last week of February, on the eve of the presentation of 1979-80 budget, showing an increase of 6.1 per cent in six weeks. Food products have recorded a sharp increase of over 17 per cent, followed by metal products 10 per cent, etc. This stoking of the inflationary spiral would not have been possible without the large amounts of liquidity in the hands of the business and trading classes.

Thirdly, a sort of creeping inflation had been in evidence even before the budget. For instance, the index for manufactured products rose by over 6 per cent in 1978-79. Within this group a large number of items recorded increases ranging from 10 per cent in jute textiles to 16 per cent in iron and steel. Metal products, electrical and non-electrical machinery and transport equipment have all experienced price increases of more than 10 per cent

during the last year.

Lastly, the price indices do not fully reflect the pressure on commodity prices. Despite some absolute fall in the wholesale price indices of cereals and pulses during the last year, the consumer price index for industrial workers (base 1960=100) shows a rise of over 2 per cent (as at end-January 1979). Between March 1976 and January 1979, the consumer price index has recorded a rise of 46 points, from 286 to 332. Likewise, the urban non-manual employees' index (base 1960=100) also increased by 43 points from 265 in March 1976 to 308 in December 1978. The *Economic Times* retail price index for Greater Bombay (base 1869-70=100) rose from 175.9 in March 1976 to 217.2 in March 1979 or by an annual average of 7 per cent. The general impression of price stability is thus on the whole false.

There is a scheme of circular causation with regard to monetary expansion and prices. Created monetary resources feed on monetary resources and commodity prices feed on prices and the two feed on each other. To cite an example, the aggregate deposits of commercial banks have almost doubled from Rs 14,325 crores in March 1976 to Rs 26,825 crores in March 1979, a rise of Rs 12,500 crores or 88 per cent in just three years. Even if the average interest paid on these deposits is taken at 5 per cent, the increase in the financial assets of the deposit holders would amount to Rs 1,344 crores a year. About half of this amount (Rs 625 crores) would be attributable to the deposit expansion of the past three years. During the same period, about Rs 9,600 crores of bank credit has been injected into the commercial system, raising the total to Rs 25,207 crores, or by 62 per cent, in three years. When the Reserve Bank plans for credit expansion in 1979-80, it will do so over a base of Rs 25,207 crores. A mere 10 per cent rise would mean a credit expansion of Rs 2,520 crores, whereas in fact the expansion has been at an average annual rate of about 17.5 per cent during the past three years. Even restrained increases in credit and money supply would thus mean very large additions to the expenditure stream which gets appropriated by a small class of manufacturers, traders and merchants and upper middle class professionals.

UTTAR PRADESH

Struggle for Employment of Villagers of Naini

Krishna Gandhi

ON the morning of March 29, police opened fire without warning on more than 6,000 villagers, nearly one-third of them women, assembled before Bharat Pumps and Compressors in Naini, Allahabad. Two persons were killed, including an old woman who died on the spot, and scores of others were seriously injured. Several persons are reported missing. These villagers had assembled at the factory gate to demand jobs in the factories of the Naini industrial belt.

There were hardly any factories some 15 years back in the Naini area situated on the southern bank of the Jamuna river, on the outskirts of Allahabad city. As part of the drive towards the big industry oriented development under Congress rule, this area was developed, as in the case of other big cities of our country. Fertile land of the order of several thousand acres belonging to 16 villages along a 7 km stretch by the side of the Allahabad-Mirzapur road was acquired for this purpose by the UP government in 1966-67. The villagers tried to oppose the takeover of their lands, but were unsuccessful in their attempts. A nominal compensation was paid to the owners of the land while the sharecroppers and agricultural labourers received nothing. To appease the villagers, the then Prime Minister, Lal Bahadur Shastri, promised the villagers that one person from each family belonging to the 16 villages would be given jobs in the factories to be set up in the area. Special training centres to train the villagers were also promised.

However, the factories which were afterwards established turned out to be highly capital-intensive, like Triveni Structurals (TSL), Bharat Pumps and Compressors (BPC), Indian Telephones Industries (ITI), etc, employing more machinery than men. Even the kind of labour required by them is mostly of the skilled category. For example, in ITI, of the total strength of more than 4,000, only about 400 belong to the unskilled category. The villagers, most of them uneducated, were considered ineligible for the skilled jobs. As for the schemes for training them, easy availability of plenty of skilled labour from outside ruled that out. In such a situation, compounded by the mounting unemployment everywhere, only a fortunate few could get jobs and that too through underhand methods like bribing etc. Today, of the total strength of about 10,000 of the three biggest factories (TSL, BPC and ITI), the number of local villagers is less than even 400. The number of adult males of the 16 villages (total population more than 20,000) requiring jobs would be at least 4,000. The managements of the factories claim to have given jobs to all the previous owners of land, thus excluding the previous sharecroppers and agricultural labourers. The villagers say that even among the previous owners a large number have not been given jobs.

For their livelihood the majority of the villagers, including women, go to the interior villages and work as agricultural labourers. The wages they receive are extremely low, about 2-3 rupees worth of grain a day. Other than this, on the average some 300-400 villagers get temporary work under the contractors employed by the factories. We were told that a sizeable percentage of even the regular work (30 per cent in the case of BPC) is handed over to the private contractors by the managements in order to fill their private pockets. Under the contractors, a worker gets 5-6 rupees a day only, whereas even the lowest paid factory worker gets a minimum of Rs 10 a day on the average. Sometimes the contractors bring their own workers from outside, adversely affecting the local villagers. A few villagers earn their livelihood pulling rickshaws and doing similar work in the city.

From time-to-time in the past, the villagers had organised themselves and agitated for employment in the factories. But so far they have been unsuccessful in their efforts. According to the villagers, the reason for this is that whenever their agitation gained some strength, the managements bought off their leaders offering them contracts money etc. While this might be true, the real reason seems to be the failure to recognise that their unemployment as well as of others in our country is due to the proliferation of modern

factories of the kind that have been set up in Naini.

It was in this background that Jagdish Narayan Shukla, a one-time Youth Congress worker came into the scene some three months back. An organisation named "Udvaasit Kisan Mazdoor Morcha" was formed to fight for the interests of the villagers. A charter of demands consisting mainly of the demands for employment in the factories and for ending the contract system was presented to the managements the local administration and the state and Central governments. A Sangharsh Samiti consisting of the village activists and Shukla directed the struggles. On February 19 a procession was taken in front of the DM's office in the city in support of their demands. Following this, from March 1 to 3 mass satyagraha was organised in which around 400 villagers courted arrest. After their release 13 days later, a meeting was held in front of the BPC gate and the managements were given 10 days' time to take some steps to fulfil their demands. When, however, nothing was done by the managements towards this, Shukla started a fast-until-death in front of the BPC gate on March 27.

With each day of hunger-strike tension began to mount. Everyday, meetings were held at the gate to which villagers came in large numbers. On the evening of March 28 an appeal was was issued to the villagers to come to the factory gate early next morning for a demonstration in support of the demands. Beginning from the night, the villagers began assembling at the gate. A large number of women came carrying with them their young children, while many villagers took their cattle also along with them. By 5 O' clock in the morning, a crowd of at least 6000 had assembled at the gate. A meeting followed in which various local leaders, including some trade union leaders, addressed the workers.

By 8 am factory workers started arriving to join duty. Seeing the villagers assembled in front of the gate they did not go inside. By this time a police force of 20-25, headed by the CO and DSP arrived on the scene. They ordered the workers to go inside the factory. When the workers refused, the police, using foul language, started pushing them with lathis. The workers grew agitated and resisted this and soon a regular clash between the police and the workers started, the police charging with their lathis and the crowd retaliating by throwing stones. Some buses carrying workers from the city to the nearby ITI were stopped and were damaged during the clash. The teargas shells fired by the police proved ineffective because of a strong wind. Then without warning the police officers began to fire on the crowd with their pistols. As soon as the firing sharted the villagers, who were relatively quiet so far, began fleeing. However, many could not run fast because of the young children with them. One old woman, hit by a bullet, collapsed and died on the spot. Another villager was fatally wounded and later died in the hospital. Among those seriously injured, a four-year-old girl is in the danger of losing her eyesight.

A PAC contingent from the city along with the DM arrived around 10.30 am. A severe lathi charge followed with the police chasing the villagers right up to their villages. Even the women and children were not spared. The villagers accused the police of snatching the ornaments of women and showed us an old woman whose ornaments had been so lost. The police was also charged with looting and ransacking the shops in the vicinity. By 11.30 am everything was quiet and none were to be seen at the gate. The police arrested Shukla from a nearby house where he had been removed by the villagers for safety. Thirty others were also arrested, many of whom were just passing by the gate at the time of the incident. They were confined in Naini Central Jail and were to be released on April 10.

According to the statement to the press issued by the police, some persons from the crowd had climbed on the roof of a nearby house from where they had started firing, using countr-made guns and throwing bombs. The villagers flatly denied this and asked how could they attack the police when they had come with women and young children, completely unprepared for any confrontation. Shukla told us that the post-mortem of the old woman's body showed that the bullet that killed her was of the police.

Various political parties and trade union leaders of both the ruling and opposition camps have condemned the firing. The trade unions of the factories however played a neutral role in the villagers' struggle. According to one local trade union worker, feelings are divided in the trade unions because the majority of the workers in the factories are from outside and the reason for the villagers' unemployment has often been interpreted as due to the influx of outside workers. In the previous struggles of the villagers also this was the case. However, the villagers and the trade unions have the common demand that the contract work system in the factories should be abolished.

The atmosphere of the villages is charged with tension. Many persons have fled from the Sandva village adjoining the BPC factory. Hardly any light is seen in the villages after dark The brunt of the villagers' anger is directed at the local CO and the factory management who they allege are acting in collusion to crush their struggle.

Immediately after the firing the DM ordered a magisterial inquiry, which is being boycotted by the villagers. Consequently its hearings have been postponed. A number of state and Central ministers including the UP Chief Minister, Banarasi Dass, have visited Allahabad but they had nothing to say on the problem of unemployment facing the villagers. The Eastern UP Chamber of Commerce has reacted to the incident by issuing a warning that, in future, no big factories may be set up in Naini if the unrest there continues For the villagers of Naini, however, it is as well that such factories are not set up and they are saved from further misery.

KERALA

Justice Delayed for Contract Labour

K T Zacharias

THE Union Government has sat on the Kerala Casual, Temporary and Badli Workers (Wages) Bill for the past 20 months, when it had taken hardly an hour for the Kerala state legislature to get the Bill introduced, discussed, and passed on August 10, 1977. Neither the state government nor the parties which constitute the ruling front have cared, however, to take up the Bill as a policy question or as a political issue. The Bill aims to assure casual, temporary and badli workers the same rate of wages as are enjoyed by the respective categories of permanent workers.

The need for the legislation is set out in the Bill itself. It says:

> There is a widespread practice of engaging in factories, plantations, motor transport undertakings, and other establishments, casual, temporary and badli workers and paying them only very low wages, quite disproportionate to the wages of the regular workers. Such workers are also being engaged for very long periods on such meagre wages; and workers do this work for such low wages in the hope that some day or other they would be absorbed in the permanent jobs. Thus, these workers are being exploited by the managements and it is considered necessary to put a stop to this unhealthy practice.

According to trade union circles, the government was compelled to bring forward this legislation as the number of disputes and struggles on this issue were on the increase. The working class movement has often been able to win the demand for equal wage for equal work. The Bill thus aims to give statutory protection to a right which in the main has been fought for and won. Clause 3 of the Bill states:

> Notwithstanding anything contained in any law for the time being in force, or any judgment, decree or order of any Court or authority, or in any contract or other agreement, no employer shall pay to any casual, temporary or badli worker employed by him in an establishment, factory, plantation or motor transport undertaking, wages, whether payable in cash or in kind, at rates less than the minimum of the wages payable by him to a permanent worker for performing the same work or work of a similar nature.

To ensure implementation of this provision the whole subject has been brought under the Industrial Disputes Act and the Labour Department has been empowered to play the same role as for the permanent workers. The employers are also required thereby to maintain the register and other records for temporary workers and to pay them wages on par with permanent workers — failing which a fine ranging from Rs 500 to Rs 2,000 is to be imposed according to the nature of the offence. Moreover, the burden of proving that work performed by any class of these workers is *not* the same as work of a similar nature done by a permanent worker rests on the employer.

Provisions of the Bill are applicable to almost every functioning unit in the state. Every factory, plantation, motor transport, every establishment covered by provisions of the Kerala Shops and Commercial Establishments Act (1960), such other establishments or undertakings as the Government may by notification in the Gazette specify in this behalf, and units "belonging to or under the control of the Central or any state government", are all covered by the Bill.

The Centre's acceptance of such a position would mean a commitment for it of crores of rupees on an all-India basis because there are lakhs of such workers in the railways and dozens of other units. In Kerala, it is in the railways alone that such workers are employed under the Centre and their number is estimated to be not more than 2,000. The Centre maintains that, in a matter such as this, however, it cannot follow different policies in different states. Hence in its letter to the state government it has underscored the large financial implications if the Central units are brought under the purview of the Bill. The Centre has evidently made it clear that the assent for the Bill can be given only if the Central units are excluded from the purview of the Bill. Labour being a concurrent subject under the provisions of the Constitution, the Centre has the final say in the matter. Taking the political situation into account, the Centre has taken a low posture and only pleaded for the exemption clause for itself.

Trade union circles, particularly the CITU, are of the opinion that the approach of the state government is to allow the maximum time lag to the exploiters. Neither the state government nor the parties constituting the ruling front have cared to take up this issue. Indeed, only after a communication was received from the Centre did the state government wake up from its lethargy, and its own activities have been confined to government-level correspondence.

Nevertheless, the ruling front and the cabinet will now have to take a final policy position in order to reply to the Centre. The Labour Minister, M K Raghavan, leaves for Delhi this month-end for consultation and discussion with his counterpart in the Union government. If the Janata government goes against the provisions of the Bill and tries to deny social security to its employees that would be "definitely a reactionary step", according to the State Labour Minister, because social security is indivisible. Thus the state government cannot divide its citizens into the Central and state categories.

While the 'indivisibility' of social security may be a good talking point, it may not be enough to make the Centre accept the provisions in the Bill. In the circumstances, the ruling front will probably opt for 'doing good' within its orbit, await the Centre's sanction and amend the Bill accordingly in the next session of the Legislature. That means that the casual, temporary and badli workers and the trade unions will have to continue their struggle for the employees under the Central government.

ANDHRA PRADESH

Police Terror in Khammam

Findings of an Investigation

ON January 31, 1979, two persons were killed in a case of police firing in the village of Panditapuram, Khammam district, Andhra Pradesh. The Civil Liberties Committee of Warangal appointed a Fact Finding Committee to investigate the circumstances that led to the firing and the subsequent developments.

The Fact Finding Committee consisted of G Haragopal, Reader in Kakatiya University, Shankaraiah, President, Warangal Town Committee of Janata Party, V L Narasimha Rao, Staff Reporter, *Andhra Jyothi*, N Venugopal Rao, Entomologist, Agricultural Research Station, E L Narasimhaiah, a writer, and S Jeevan Kumar, member, Warangal Civil Liberties Committee. The Committee also included Ranganath and Vithal Rao both convenors of the state level civil liberties committee.

The Committee arrived at Khammam on March 11 and visited Panditapuram and Kothalingal villages on the same day and met a cross-section of the people in the villages — the patwari, the patel and the landlord of Panditapuram and several villagers. On March 12 the Committee interviewed the District Collector, the Superintendent of Police and the local MLA. The Committee also visited the spot where the firing took place and the tank which has been the source of tension and controversy.

The village of Panditapuram is situated at a distance of about 16 km from Khammam. The village has a population of about 6,000. The dominant castes are Khammas, Vyshyas and Brahmins. They together constitute ten per cent of the population. Gouds and Vadaras account for about a third of the population of the village and Lambadas and Harijans account for about 15 per cent. There are also some Muslims and Erukala families.

Total village land amounts to 5,700 acres out of which an area of about 1,000 acres has minor irrigation sources. The entire land is owned by 280 pattadars who for the most part belong to the upper castes — Khamma, Vyshya and Brahmin. Some Vadaras, Gouds, Lambadas and Harijans also have pattas of small portions of land. The rest of the people are landless and depend for their livelihood solely on their labour, and agriculture is the only major source of employment.

As there are no permanent sources of water, the villagers depend entirely on tanks not only for their irrigation but even for domestic purposes.

Mallaiah is a big landlord. In addition to being a big landlord, Mallaiah is also a moneylender, lending money at exorbitant rates of interest. Added to all this is his control over Konda Reddy tank Shikam land (land which is fit for cultivation when water is exhausted in the tank) which has been a source of constant tension in the village.

Konda Reddy tank is one of the largest tanks in the village. The ayacut under this tank is 102 acres, out of which 20 acres are dry and the remaining 82 acres are wet. This is in addition to 62.20 acres of Shikam land under this tank.

In the 1930s the Shikam land was under the Jagir of Nawab Shoukhat Jung. This was sold to 33 cultivators in the village who cultivated it for ten years. It is believed that the Jagirdar auctioned it when the 33 cultivators were unable to pay the instalments. That is how Bodempudy Veeraiah, father of the present landlord, acquired control over the tank. Generally the Shikam land belongs to government which allows the villagers to cultivate the land and share the produce. Even now, the tankbund belongs to government. In the neighbouring village, Kothalingal, 16 acres of Shikam land is under the control of government. But in the case of Konda Reddy tank an unusual situation of a private landlord being the owner of what should be government land continues to exist.

The tank and the land under it has been a subject of controversy for a long time. Buggarapu Seetaramaiah, the local MLA who hails from this village, has been a witness to this controversy from his childhood. The villagers have been pleading with the landlord not to let off the leftover water during the summer as it would inconvenience the whole village. According to the landlord, the water is let off by fisherman, but the fact is the beneficiary of this practice is the landlord himself.

This year too the water was let off depriving the people of water and also damaging the crops. When the matter was brought to the notice of government by the patwari, the authorities paid no attention to it.

The villagers, particularly the labourers, who were convinced that unless their resentment was expressed effectively the landlord would continue to cause inconvenience to all the villagers, decided to organise themselves and formed the Ryotu Kooli Sangam, under the leadership of Raghavaiah. They also decided to demand higher wages during the transplantation and harvesting of the kharif crop. This year the landlord had planted blackgram in 40 acres of Shikam land which was ready for reaping by January. On January 29 the Ryotu Kooli Sangam decided that they would express their resentment by not allowing the landlord to reap the harvest. As a part of implementing this decision, the labourers also took away a part of the harvest.

The landlord lodged a complaint of theft with the police and a huge police contingent arrived in the village the same night. The Superintendent of Police has admitted that the police force that was deployed was more than what the situation demanded.

On the night of January 30 the police arrested two persons, Gundla Bhaskar Rao and Dodda Susheela, a widow This created a sense of fear in the village and many of the villagers spent a sleepless night outside the village. They decided that they would make a representation to the police officers for the release of Bhaskar Rao and Susheela. A large number of villagers, predominantly agricultural labourers including old men and women and boys and girls, gathered under a tree outside the village and took out a procession about two-furlong long at 2 pm the following day. They raised slogans demanding the release of the two arrested persons and the shifting of the police camp from the village. The procession was oganised in such a way that about 100 women labourers were at the head of the process with six old ladies who were to actually negotiate with the police in the forefront. There were even many mothers with their babies, clearly showing that the processionists had no plans to resort to violence.

Nevertheless a lathi charge was ordered by the sub-inspector of police on the procession. When the DSP arrived with a fresh police contingent, there was already much chaos and confusion. Jalagam Veeraiah had received a head injury and was bleeding profusely and Jalagam Venkanna had also been injured and many of the people had started running helter-skelter. In

this melee, the DSP apparently fell down on a ploughface sustaining injuries. The Committee could not meet the DSP as he was away from Khammam. However the SP of Khammam has shown the photographs of injured DSP and the Committee could see that the DSP had received multiple injuries including a head injury.

At what point of time firing was ordered, nobody could tell but according to the villagers, the lathi charge was quickly followed by firing in which Kunchapu Nagalaxmi, a fifty year old woman and Vatti Lalaiah, a 22 year old man were killed. The official version of the incident is that the mob had planned to attack the landlord and deliberately attacked the DSP. However, the landlord himself has not said that there was any threat to his life. According to the police patil of the village, the 'foolish villagers' did not recognise the DSP at all, as he was in 'civil dress'. When the villagers were asked about the allegation that they had planned to attack the DSP and the landlord, they said that had they had any such designs they would not have taken out a procession, involving old ladies, young boys and girls and mothers with their babies.

Available evidence suggests that the firing started very suddenly. There was no warning nor were other methods of crowd control — such as teargas — used. There is also reason to believe that the guns were aimed above the waist level. In the case of Lalaiah who died in Khammam hospital, the bullet passed through his eye. Nagalaxmi, another of the dead, was rising from the trench into which she had fallen while running away, when the bullet hit her near the left arm-pit coming out on the right side. Challa Laxmaiah, a 12-year old boy, was hit near the left elbow. In fact, all those who received bullet injuries received them above their waists.

Even the dead were not spared. Nagalaxmi's dead body was lying unattended for about 19 hours from 2.30 pm to 9 am the next day. After the post-mortem the body was left at the spot were she was shot instead of being handed over to the relatives; and after her funeral her son-in-law was arrested. Lalaiah's wife and parents came to know about his death only the following day. Laxmaiah, the 12-year old boy who received bullet injuries, was kept under police custody for two days after being discharged from hospital and was directed to report to the police camp everyday in the morning.

Developments since Police Firing

Apart from the firing, the huge contingent of Andhra Pradesh Special police that has been stationed in the village resorted to several other repressive measures. Some of these are described below.

On February 1, a woman who was under detention in the Panchayat Office of the village which was being used as a police camp, was beaten and raped by two police constables. Two other cases of rape were reported to the Committee and the committee tried to meet these two women; but it could not do so as they were not available in the village. Instances of harassment of women were also brought to the notice of the Committee. While interrogating Seetha, a 15-year old girl, about the whereabouts of her husband, the police constables started manhandling her. When her father-in-law Deshagari Biksham intervened he was beaten up and sustained a fracture to his right hand.

There were also many instances of illegal detention — Krishna Murty (17 days), Dodda Susheela (13 days), Nalamasa Komariah (7 days) and Darawat Mallu (5 days). Dodda Ranganna and Dodda Venkanna were detained for nine days, earlier their father was in police custody until these two were arrested. Many who were thus detained were also tortured. Two young boys — 10-year old Gaglothu Meghya and 8 year old Bhanotu Lakku — were detained for five days during which they were both beaten and given the 'roller treatment' because they 'sang songs'.

Altogether, 86 persons including 11 women were arrested in Pandithapuram and Kothalingal. In the case of Kothalingal, all the 24 persons were arrested on the basis of the information furnished by the police patel. The Congress(I) MLA of the area told the Committee that in Panditapuram a local Janata leader got seven Congress(I) workers arrested purely on personal reasons. Three mothers whose children are dependent on breast feeding were separated from them. Instances of a couple being in jail and their two-year baby being left outside and of a 60-year old lady being in jail for more than 40 days have come to the notice of the Committee.

The specific case of Dodda Susheela who was arrested in the dead of night is a clear violation of the existing instructions from government after the Ramizabee case. According to these instructions women should not be arrested in the night nor be kept in lock-up; even for interrogation purposes they should not be brought to the police station during the nights.

Cases of the police compelling some of the villagers to supply them toddy and chicken were reported to the Committee. Beating up by the police of the parents and relatives of those who ran away from the village has been a most common and frequent complaint. An instance of an entire family (that to Raghavaiah under whose leadership the Ryotu Kooli Sangam was organised) fleeing from the village came to the notice of the Committee.

The police insist that villagers should return from work by 8 p m. Many villagers, particularly the Gouds, explained that the nature of their work demanded their presence at the work place till 11 p m. The police insistence, they complained, put them to a lot of difficulty.

The Committee is of the opinion that repression has been resorted to in Panditapuram because it was feared that protests and demands which the toiling classes in Panditapuram were making might spread to the other neighbouring villages. The superintendent of police actually expressed such fears.

Panditapuram today bears a pathetic look. There is widespread fear among the poor people in the village. The fact is that in spite of several complaints against the landlord, including a specific complaint by the patwari, no action was initiated by the administrative machinery, but a complaint by the landlord was taken so seriously that the state machinery pressed a huge police force into action immediately.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

C.W.S. (INDIA) LIMI

Registered Office: 45/404A Bristow Road, Willingdon Island, Cochin 682 003.

Announcement regarding the Issue of Equity Shares of Rs. 10/- each for cash at par.

Applications have been made to the Stock Exchanges at Bombay, Bangalore and Madras for permission to deal in and for an official quotation of the Equity Shares of the Company.

The Subscription list will open at the commencement of banking hours on Monday, the 7th May 1979 and will close at the close of banking hours on Friday, the 18th May 1979 or earlier at the discretion of the Board of Directors of the Company, but not earlier than the close of banking hours on Wednesday, the 9th May 1979

HISTORY, BUSINESS & LOCATION

Cooperative Wholesale Society Limited is a body corporate incorporated in England with limited liability and registered under the Industrial & Provident Societies Acts 1893 to 1968 and having its registered office at New Century House, Manchester, United Kingdom (hereinafter referred to as "the Society") The Society is engaged in manufacturing of wide range of food and non-food products and trades as importer, wholesaler and distributor both within and outside the United Kingdom The Society also has a most modern tea blending and packing factory in Europe The Indian business of the Society which was started in India in the year 1923 was originally owned by English & Scottish Joint Cooperative Wholesale Society Limited, U K. Subsequently, the name of the said Society was changed into Cooperative Tea Society Limited and thereafter there was a transfer of engagements in 1973 and a consequent Release Deed by virtue of which the Society became the owner of the Indian undertaking of Cooperative Tea Society Limited The Society owns eight Tea Estates in India of which seven are in Tamil Nadu and one in Assam

The Company was incorporated on 24th September, 1977 with the main object of using it as a vehicle for Indianising the Indian business of the Society. The Company has acquired the Indian Undertaking of the Society as a going concern with its assets and liabilities as at the close of business on 30th September 1978 pursuant to a Scheme of Arrangement and Amalgamation which was approved by the High Court of Kerala at Ernakulam, by its order dated 14th March, 1979 The total valuation of the Indian business of the Society has been fixed by Reserve Bank of India at Rs. 245 lacs. The Company has in part satisfaction of the aforesaid consideration allotted Equity Shares of the total value of Rs 74,00,000 credited as fully paid-up for consideration otherwise than in cash to the Society, and the balance consideration of Rs. 1,71,00,000 has been retained in the Company's Books of Accounts as interest-free unsecured loan from the Society repayable in five equal annual instalments The first of such instalment will fall due on 1st October, 1979.

Election Prospects

Farrukh Dhondy

ACCORDING to the opinion polls, the Conservatives have a 21 per cent lead in the general elections scheduled for May 3. All they need to achieve a majority in the House of Commons is a four per cent lead over the Labour Party throughout the country. The lead that the polls give the Tories is tantamount to a Tory majority of 200 in the House. The main issues in the forthcoming election are waffle. The Tories have declared themselves for 'freedom'; the Labour Party for 'fairness and justice'.

The Tories stand on three or four planks. They are committed now to reducing income tax across the board. This means they will give the rich a lot of money back and give the middle-income brackets enough to get them to vote Tory. Less tax means less government money to spend on the programmes that Labour has traditionally championed, such as school milk for all, more hospitals, measured increases for pensioners, supplementary benefits for families, etc. The pollsters declare that the majority of the country are against the benefits and for the tax cuts. I am not so sure. Labour's record on health and education and welfare spending has been disastrous, but the voters are being asked to choose between the devil and the deep blue devil. There is just about enough sentiment attached to the Labour Party on the issue of welfare to give it a margin on the Tories.

The Tories want to cut state benefits to strikers' families. What happens at present is that when a man (it does not work for women) goes on strike and stays on it for three weeks, his family can queue up at the supplementary benefits office and receive a pittance to keep the wolf from the door. The Tories have pledged themselves to ending this practice which they label as 'scrounging'. The pollsters say they have the support, not only of the nation, but of most trade unionists. Again, I am not so sure. The amount of money that any government would save in this way is negligible. The policy is framed to appeal to a union bashing instinct in the nation's character. Out of a population of about 60 million people, 12 million people are in unions. The other instinct to which the British working class subscribes is class hatred. I do not think they will vote for a measure which victimises women and children because men are on strike.

The Tories have also declared themselves against 'secondary picketing'. This is a phrase which came into general usage last winter, when lorry drivers on strike picketed the depots of other lorry drivers who were not on strike to bring business all over the country to a standstill. The Tories want a law which will confine the striking force to its own shopfloor, factory or depot. If they win they will pass the law because they feel that the majority of the population are for it. It will be their most significant blunder, because politics is not about persuasion, it is about power. The very people who vote against secondary picketing in a general election or in an opinion poll realise, when they are themselves in dispute with the government over money or anything else, that the rules of the Marquis of Queensberry are for entertainment and a knee to the crotch is life.

In the intellectual papers, the election is seen as a debate between the watered down Keynsian economics of some possible future Labour Chancellor and the determined monetarist theories of Keith Joseph and Margaret Thatcher. The intellectual economic debate translates paradoxically into realpolitik. For the last 15 years, the Labour Party has tried to make peace with the unions with concordats and agreements. The unions will plan their wage thrusts in consultation with the government which will in return give their leaders peerages, agree to legislation on closed shops, give members tax relief on union subscriptions, maintain a level of social spending, etc. The Tories have always envied this special relationship between the Labour Party and its union stooges. The hierarchy of the unions remains very loyal to Labour, so the Tories have in the last ten years attempted to launch a rank and file revolt against these leaders and against the democratic structure which makes Labourites the leaders of unions. They now profess themselves in favour, because of the logic of monetarism, of 'free collective bargaining'. This means that the unions will ask and strike for whatever they want and if the employer cannot pay, the company will go into liquidation and throw the workers out of jobs. That will teach the other workers a lesson and there will be fewer strikes and more profits.

So much for the Tories. The Labour Party promises nothing. It is in a peculiar historical trap. It's last government was as Tory as a Labour government could ever be. It cut public spending, pawned the country to the IMF, tried to hold back wages and allowed prices to find an agreed but steady increase and all round encouraged the owning classes to feel that a stronger army, more police, more of a clamp-down on social disorder, fewer taxes, less support from the government for programmes to combat unemployment, were on the cards. They paved the way for the government of Margaret Thatcher.

They base their election on their record of bringing inflation down to ten or twelve per cent. What else they have going for them nobody knows. This is an election in which the Labour Party stands for nothing except its own survival. Its own left-wing smells defeat in the election and prepares its hatchets for the blood of Callaghan and Healey, chief architects of the Labour demise Once again I am not so sure. Labour could win the election simply because the Tories stink of conflict and the third instinct of the electorate comes into play. They want a quiet life.

A few projected anomalies in this election. Margaret Thatcher is the MP for Finchley North. She won her last election by a majority of 4,000 votes over Labour. That was in 1974. Since then, two events have intervened. In 1978 she went on television as the Leader of the Opposition and said that "immigrants were swamping the country". It was a racist speech. The impression of this blue-eyed lady attempting to stir up racial hatred remains with the Asian population. There are 5,000 Asian voters in Finchley North.. All other factors being stable, they could vote Margaret Thatcher out of parliament by a thousand votes.

The other event was the spectacular and totally unexpected victory of the Liberal Party candidate in a by-election in Edge Hill, near Liverpool. The poll was held a few days before the announcement of a general election. The Liberal candidate got more votes than the Tory and Labour candidates together. Undoubtedly, this is a freak result. The Liberal candidate had been for years a community campaigner in Edge Hill and the vote reflected his personal popularity rather than the resurgence of the Liberal Party which has not recovered from the committal of their former leader Jeremy Thorpe to trial for incitement to murder. The point is that Finchley North has a strong Liberal candidate too. Traditionally the disillusioned or wary Tory vote goes to the Liberals.

New Agrarian Crisis

Gail Omvedt

The Political Economy of Food by Vilho Harle; Saxon House, 1978; pp 438, $ 25.

Strawberry Imperialism: An Enquiry into the Mechanisms of Dependency in Mexican Agriculture by Ernest Feder; Editorial Campesiono, Mexico City, 1978.

AN analysis of agriculture is crucial to an understanding of the present workings of imperialism as well as the political and economic crises of third world countries. In spite of land reforms and two decades of developmental efforts, not only do hunger and malnourishment continue, but the inability to sufficiently raise production and the income level of the rural masses constitutes the major barrier to industrial advance. But why this failure continues and what the dynamics of the process are is becoming more and more difficult to answer, for the traditional explanations no longer hold.

This is clear from a perusal of Vilho Harle's collection of papers from a seminar in Finland in 1976. For while a large amount of empirically useful material is presented and almost all the important points are touched upon, still the book remains theoretically eclectic and fails to provide any clear political solution to the current "food crisis".

Some points emerge fairly clearly:

(1) As Helena Tumoi's lead article makes clear, the present food crisis is a *new* one, characteristic specifically of the post-colonial period. Under colonial rule there is no doubt that absolute levels of hunger and the incidence of famine death were higher at a time when most third world countries exported food. Now, while problems of often brutal malnourishment remain, the characteristic phenomenon is a growing *dependence on grain imports* from the developed countries, specifically the US and a few others (projected by an Asian Development Bank survey to reach 12 million tons a year for India by 1985). The roots of this were undoubtedly laid during the colonial period, when third world countries became exporters of cash crops while their own subsistence agrarian economies stagnated and when, from about the 1920s and after (according to Vilho Harle's article), agriculture in the US and Europe became rapidly idnustrialised with rising use of inputs and production growing faster than it could be consumed. Now the system has "matured" in such a way that third world countries remain food exporters and their citizens go hungry while the main beneficiaries of rising food production at a world level remain the citizens of the "developed" world, including socialist as well as capitalist countries. The "food crisis" is thus one of the nature of third world countries' integration into a world agrarian system.

(2) Connected with this is the skyrocketing growth of agribusiness, i e, domination of agriculture by transnational corporations. Their control is not only of inputs (from fertilisers to tractors) and of the processing and sale of food products, but also often a control of production itself, either directly or indirectly through "production contracts" with growers of specially food products usually designed for export. Two important articles by Ernest Feder and Gonzalo Arroya analyse this process, stressing that under the "unique conditions of underdeveloped agriculture" agribusiness firms make their profits primarily from lower costs (of land, construction and primarily labour) rather than by technological advance, and that consequently they tend not to transmit technology and to be wasteful of natural and human resources.

(3) Not so fully analysed is the fact that grain import dependence and ties to agribusiness have coincided with attempts by third world governments to institute land reforms, developmental and other policies designed to transform feudal or precapitalist land relations. As Feder puts it, questioning the usual faith in land reform and change in land use practices, "Who would have believed that only ten years ago in the non-socialist underdeveloped countries there would begin a transformation of the traditional resource use pattern in terms of intensification and even diversification of land usage which would have as a consequence the exact opposite: namely a dramatic worsening of the food and resource situation" (p 131). That is, the spread of *capitalist* relations in agriculture has been a crucial part of the developing crisis.

What Is the Cause?

The "traditional" explanations, I have argued, are inadequate to analyse this. The bourgeois faith in the spread of technology without institutional reform, i e, the ideology of the "green revolution", is clearly erroneous since most of the available technology simply does not spread. But the traditional Marxist explanation which calls for land reforms is also inadequate.

Two articles in the book take this viewpoint. Leon Bagramov claims that the food crisis is due to the maintenance of semi-feudal land relations and the failure to carry through radical reforms. The problem with this is that the most "radical" (non-socialist) third world countries, the ones with the relatively most thorough reforms, the very favourites of the "non-capitalist" path, are precisely the most food-dependent: the list includes Algeria, Egypt from its Nasserite days, Mexico, Venezuala, Peru, Tanzania and others (see Appendix A in the book). Is the problem that land reforms have not "really" destroyed feudalism — or are other processes at work?

Lars Bondestam, in a long and eclectic article, also argues that the "modes of production" within African countries play the primary role in blockading improvement of production, thus leading to dependency. But his argument as to why feudal and other pre-capitalist modes block production is extremely weak, resting mainly on a definitional trick — feudalism is by definition stagnant, i e, if feudal lords invest they no longer remain feudal but become capitalist entrepreneurs. If pre-capitalist modes of production (which block agricultural development) are in fact changing into capitalist modes of production (which also block development but in a different way) then where in fact is the dynamics of the system?

It seems that the present agrarian crisis is not one of a "semi-feudal, semi-colonial" economy, but rather a crisis of a growing capitalist economy — which suggests in part a re-reading of Marx and Lenin who saw agriculture as a crisis area within capitalism as such and not simply within the feudal sector of a society under colonial rule. Still, what is further needed is an analysis of why, within the imperialist framework, this crisis hits third world countries in the particular way it does.

Feder and others writing on agribusiness are the ones who point most strongly to imperialism as the main

enemy, in the form of multinational domination: technological stagnation, wasteful use of land, reliance on controlled supply of cheap labour are not characteristics of feudal forms so much as of the workings of the most modern capitalist organisations. Feder's argument is to a large extent based on a recently published case study, a book which may be much more accessible to Indian readers than the expensive Harle Volume, and the difficulties with his position also emerge from a reading of this.

The "US strawberry industry located in Mexico" exports 99 per cent of its produce to the US, is the biggest Mexican fruit export earner, and is dominated by US capital. It is the main competitor of the California strawberry industry, which incidentally is also worked largely by Mexican labour, though the workers in California farms and factories earn 8 and 13 times as much as their compatriots in Mexico.

Feder describes in graphic detail the chaotic nature of the industry in Mexico, the total subjugation of the Mexican government before the whims of the US brokers, the failure to modernise and "transfer technology" (California yields have consistently grown while Mexican yields have remained stagnant), and the blockage in fact of any technological and research development within Mexico suited to Mexican conditions. He argues that this situation results generally because cheap land and labour in Mexico are the basis of profits. Even more, if Mexican wages and other costs were to rise, the result would not be to impel technological advances but to drive the industry out of Mexico entirely, for the technological difference between it and the California industry is so great as to make incremental production advances fruitless. (And it would be no less to Mexico, he adds, to have resources devoted to food for Mexican mass consumption rather than US luxury consumption.)

But questions remain. This after all is a case of capital accumulation through absolute as opposed to relative surplus value, and according to Marx the main historical cause of the switch to the latter has been the struggle of the working class against the most bitter forms of exploitation. Why then, doesn't this take place in the Mexican industry? The answer to this points us away from the strawberry industry as such (away even from the machinations of US capitalists) and to the *surrounding totality of agrarian relations* — for union formation is kept difficult and wages are kept low due to the existence of a huge "reserve army", the massive influx of Mexican peasants dispossessed from their land and flocking into the towns for work. And this phenomenon, which is becoming generalised in the third world, is not due to absolute poverty or to the existence of a semi-feudal economy where peasants are tied to the land, but is a particular result of the spread of capitalist relations in post-colonial period.

Still, what are the main features that make this different from the original spread of capitalism in Western agriculture? The answer to this does not clearly emerge, though many points are brought forward. Many argue that low prices for foodgrain production in third world countries contrasted with relatively high prices of usually imported inputs make investment in agriculture relatively unprofitable and thus lead to stagnation; these low prices, it is said again, result from a failure of demand by dispossessed and unemployed ex-peasants. Missing here is a contribution from the Samir-Amin-de Janvry school which points precisely to the role of low wages and cheap food as a factor relating particularly to disarticulation in third world economies. The concluding article by Jurgens Heinrich also make the important point that capital accumulation depends [illegible] non-capitalist sectors — whic[illegible] suggest a reading of Luxembourg as well as Lenin and Marx — but fails to show how this is related to the specific current crisis.

There is finally one more important gap, the failure to critically analyse the role of the Soviet Union and Eastern Europe. Here are on asked questions: If "overconsumption" in the developed world is a major factor in the maldistribution of world food resources as one article suggests, what about consumption levels in the Soviet Union, which are nearly as high as those in the US — for it was a political decision to maintain these consumption levels which lay behind the massive Soviet grain purchases of 1973 which sent world prices skyrocketing. If "production contracts" with multinationals are bad, how are they different from production contracts with the Soviet bloc? Finally, if as Feder argues, the socialist countries may be ready in a few years to become major grain exporters (they already have a growing share of fertiliser and tractor trade), is there an assurance that if the "radical" but food-dependent third world countries simply transfer their dependence to the Soviet Union, the "food weapon" will not be used?

Understanding Public Debt

K N Reddy

Burdens and Benefits of India's National Debt by V B Ghuge: Himalaya Publishing House, Bombay; pp 196, Rs 3.

PUBLIC DEBT is a fascinating subject which concerns every one and, as Paul Samuelson put it, "like sex or religion, we all love to discuss it". The book under review shows concern about the growth of public debt in India. However, in comparison with India, the growth of public debt in UK and USA has been much more spectacular. In certain years, public debt in these countries has exceeded their national incomes. And yet not many economists have viewed it as a bad sign. For, the "growing debt holds little peril for a dynamically growing economy". In India, the size of national debt, at 55 per cent of national income, is causing us much concern. The principal reason for this may be that not many studies have been made on the burdens and benefits of public debt. The book under review certainly contributes to an understanding of public debt and should be of considerable use to students of public finance.

The book starts off in typical text-book style by reviewing briefly the pre- and post-Keynesian theories of public debt. Then it goes on to discuss "allocatory burdens and benefits, redistributional burdens and benefits, internal debt and economic stability, relation between public debt management and monetary policy and the burdens and benefits of external debt" in the subsequent chapters.

Although much space is devoted to the review of pre- and post-Keynesian theories, justice is not done to recent controversies on the burden of public debt — particularly the arguments of W G Bowen, R G Davis and D H Kopf, C S Shoup, Buchanan, Vickery, Scitovsky and Elliott and Lerner. Without going into the contributions of these writers, Ghuge merely states that "the proper way to describe the phenomena would be to inquire whether the public debt is burdensome or beneficial to society at present and in future years".

In assessing the benefits and burdens of public debt, quite a bit of painstaking work has been done. But it is not clear why Ghuge has not kept in mind

the aspect of double counting in the aggregation of public debt. It is well known that a major portion (75 per cent) of the states' debt is on account of loans taken from the Centre, and if no deduction is made to the extent of loans taken from the Centre, the aggregation of Central and states' debt would give an exaggerated picture of total public debt. Similarly, the calculation of debt services involves double counting. For example, the interest charges of state governments include those paid to the Central government, while interest charges of the Central government include those on loans it has taken, irrespective of recoveries made from state governments and commercial departments. It would have been better had interest charges paid by state governments on loans taken from the Centre been deducted, particularly when they are expressed as a percentage of national income to assess the burden of debt.

Ghuge finds that national debt as a percentage of national income has been declining from 89.4 per cent in 1945-46 to 56.7 per cent in 1972-73 and finds fault with the allocational strategy of public expenditure. To improve the *allocational strategy*, he suggests that Centre should minimise the outstanding volume of Central loans and the states themselves should borrow in the market. He also suggests a different scheme of grants and loans to different states on the basis of their levels of development.

About the distribution of burdens and benefits, Ghuge concludes that "during 1966-69, the servicing of public debt has raised inequalities of income while during the Fourth Plan it has become less regressive". The evidence he presents is, however, not sufficient to substantiate this conclusion. Ghuge discusses several concepts like 'Central debt' and 'effective debt' which are relevant for an assessment of the effects of public debt on income distribution. Another noteworthy point he makes is that the liquidity effect of internal debt continued to be the principal source of monetary expansion and the resulting inflation and rise in cost of living.

Ghuge has discussed at length the burdens and benefits of external aid. Debt service cost of external aid formed a fairly high proportion of national income from 1966-67 to 1972-73. It was 1.15 per cent during the three annual plans and 1.14 per cent during the Fourth Plan. This is a big rise over its level of around 0.01 per cent on the eve of the First Plan. Several interesting suggestions have been made for effective utilisation of external aid.

Ethics of Accommodation

Jashbhai Patel

The Twenty-Ninth Day: Accommodating Human Needs and Numbers to the Earth's Resources by Lester R Brown; W W Norton and Company, New York, 1978; pp ?63, Rs 3.95.

THE title of the book, "The Twenty-Ninth Day", is at first sight an odd one. It comes from a French riddle: "A lily pond contains a single leaf. Each day the number of leaves doubles. Question: If the pond is completely full on the thirtieth day, when is it half full? Answer: On the twenty-ninth day." Our world is half full and we are just a generation away, if not a day, from the time when it will become full. Then there will be no room left for more people.

Lester Brown is president of the Worldwatch Institute and has written several books on earth's problems. His book "In the Human Interest" has been well received. The Worldwatch Institute came into existance in 1975. It is governed by an international Board of Directors with Orville L Freeman as its chairman. Its aim is to study the problems of our earth and its environs. The Institute, in its short span of life, has published many studies and several books of current interest.

The present book is one more publication on ecology. The first book on ecology to catch the public eye was "Silent Spring" (1962) by Rachel Carson, who warned us of the dangers of chemical pesticides, the second one was the Club of Rome's "The Limits to Growth" (1972) by Donella Meadows and others, who pointed to the paucity of the world's nonrenewable resources, the third was "Small Is Beautiful" (1973) by E F Schumacher, who reassessed the plans of modern technology in human society; the fourth one was the Worldwatch book "Losing Ground" (1976) by Erik Eckholm, who examined future food prospects; and now in 1978 we have "The Twenty-Ninth Day". To save the earth, the world's organisations, instead of publishing books, should now act and match their words by deeds.

This is not to suggest that Lester Brown's book is of no use. He has ably shown that the four principal biological systems, namely, fisheries, forests, grasslands and croplands are used by man beyond their carrying capacity and a breakdown of one or all is imminent in the near future if remedial steps are not taken in time. He also envisages a drop in world oil production and rightly projects energy shortages in the eighties and nineties. He refers to economic and political dilemmas which baffle economists and politicians. Speaking of economic dilemmas, he says "The simultaneous existence of uncharacteristically high inflation and unemployment in virtually all of the major industrial economies during the mid-seventies poses a dilemma for which the modern Keynesian economist has no answer. From time to time, accelerating inflation or rising unemployment has upset economies, but rarely have both struck at once." What can be said in the circumstances of politicians? For them the dilemma is worse. According to Brown: "Coming to terms with the political dilemma . will not be easy or necessarily pleasant. Historian Arnold Toynbee sees increasingly authoritarian governments emerging as economic growth slows or stops. "In all developed countries", he writes, "a new way of life — a severely regimented way — will have to be imposed by a ruthless authoritarian government." Our principal hope for limiting the need for such controls is to "voluntarily check our excessive consumption and procreation".

The prospects are particularly grim for poor nations. Their people have hardly shared in the benefits of the scientific and industrial revolution. Rather they have become the victims of that revolution. The rich nations enslaved the poor nations and brutally exploited their cheap labour and natural wealth for over a century to feed the rising industries. Now the rich nations have impoverished the earth and the poor nations are left high and dry. Do the rich nations want to accept these facts or do they want to legitimatise their dark deeds? Also, after writing off compensation to the poor, do rich nations want to discharge their old debts to mother earth, whom they have robbed, or do they expect the poor, who do not have enough to eat, to foot the bill? Answers to these questions are not found in Brown's book.

Direct Tax Reform

Family as Tax Entity and Other Issues

K Sundaram

V Pandit

The draft five year plan 1978-83 calls for a major effort at mobilisation of additional resources. Much of this effort will have to be directed towards raising further tax revenues. So far, the policy-makers have mainly relied on indirect taxes in their efforts to raise additional resources. Since indirect taxes already contribute more than 77 per cent of the total tax revenues, a stage has clearly been reached where we have to rely increasingly on direct taxes.

In examining the possible changes in the system of direct taxation, while revenue implications are no doubt important, considerations of equity and incentive cannot be ignored.

Within the set of direct taxes, income-tax is the principal source of revenue. The focus of this paper, therefore, is on possible rationalisation of the system of income taxation. It excludes from the scope of its analysis provisions relating to enterprises, incorporated or otherwise, including co-operative societies. Limiting the scope to the taxation of individuals and Hindu undivided families (HUFs), attention is focused on the question of what ought to be the tax entity, the tax treatment of his entity, and the consequences thereof in terms of equity and revenue. In this context, some of the existing provisions on exemptions and deductions are reviewed from the point of view of equity and incentive for saving.

I

The Tax Entity

IN our view, the question of what ought to be the tax entity is central to any meaningful analysis of the system of direct taxes. Logically speaking, it ought to be identical with the decision-making unit appropriate to the tax in question. In so far as income is not earned for its own sake, decisions regarding income and expenditure are conjoint. Therefore, for purposes of income-tax, the relevant tax entity would be the basic unit which takes these conjoint income-expenditure decisions. It might be suggested that, in the Indian context, this basic unit, outside of enterprise, etc, would be the household. However, the larger notion of a household includes certain members whose membership of the household is typically a temporary phenomenon. For example, unmarried major children may temporarily be in the household of their parents but are eventually expected to form a separate nuclear family of husband, wife, and minor children. Even in a situation of joint family living together, most of the income-expenditure decisions would typically be taken at the level of the nuclear family as defined [hereafter referred to as NF]. NF is thus the logical tax entity as far as taxation of income/wealth is concerned.

A central feature of the existing system of taxation of income and wealth is that it permits a multiplicity of tax entities corresponding to a single income-expenditure decision-making unit. Two principal instances of this are:

(i) where two earners belonging to a single NF are treated as two separate tax entities (as individuals);

(ii) where by the device of the HUF, a joint family gives rise to tax entities several times the number of NFs contained in it. For example, a small joint family of "widower father and three adult but unmarried sons can form as many as eleven HUF assessment units and at the same time have four individual assessment units".[1]

This situation of multiplicity of assessment units corresponding to a single NF (the logical tax entity) entails severe revenue loss. It is also quite inequitous. The revenue loss arises principally from the fact that each entity enjoys a variety of deductions for tax purposes over and above a blanket exemption up to Rs 8,000 or Rs 10,000 (depending upon the total taxable income). Further revenue loss results from the fact that, due to these exemptions, the effective marginal tax rates are lower. Inequity of tax incidence is manifest in differential tax liabilities incurred by NFs with the same aggregate income — due solely to the fact of there being more than one tax entity in some of these.

The suggestion that NF be treated as a single tax entity is not altogether new. In some respects, the idea of clubbing the incomes of wives and husbands mooted in the budget speech of 1971 may be viewed as a precursor to the present proposal. Subsequently, the Raj Committee on agricultural taxation also recommended the adoption of the family as the unit of assessment for the Agricultural Holdings Tax proposed by it, but did not generalise the proposal to cover income and other direct taxes

At this stage, it would be pertinent to consider certain sociological/legal issues that have been raised in the context of clubbing of the incomes of spouses. One oft-repeated argument is that such a proposal violates the sanctity of the freedom of the individual man or woman. In our view, collective responsibility to pay taxes does not constrain the freedom of the individual any more than do other collective obligations arising in the course of running the family.

If the treatment of NF as a single tax entity entails the payment of a larger amount of total taxes, the apportionment of the same between the earning members can be settled in the same manner as are numerous other questions of joint expenditures out of the total family income. Equally, it must be stressed, the former involves no more abridgement of individual freedoms than are implied by the latter.[2]

The other issue usually raised in this context is that of extra expenses incurred in the process of a second member of NF going to work. It must be emphasised that this is a question of

how the tax entity is to be treated by the tax system and is to be clearly separated from the question of what the tax entity ought to be. Thus, there is nothing inherent in the suggestion that NF be treated as a single tax entity which prevents one from granting a tax-deductible allowance on account of such an expense in the shape of, say, a second standard deduction for the NF. We shall later examine this question further.

Since the treatment of a family as a tax entity implies clubbing of the incomes, and a possible increase in the total tax liability, it has been contended that this measure would hit hard the so-called middle-class families.[3] We shall see later that the measure in question does not at all increase the tax liability of families with total annual earnings of Rs 14,000 or less. The proposed change really begins to bite only when the total income exceeds Rs 25,000.[4] It can hardly be argued by anybody that families earning Rs 25,000 or more constitute the middle class in an economy where nearly 50 per cent of the population lives below the poverty level of approximately Rs 4,000 per year.

Though we have discussed some of the questions raised by the treatment of NF as the tax entity only in terms of the clubbing of the incomes of spouses, it must be emphasised that the proposal simultaneously implies also the abolition of HUF as a tax entity. Therefore, the argument advanced by the Choksy Committee against the adoption of family as a taxable unit that "in the context of HUF being a separate taxable unit further complications would arise in evolving yet another separate taxable unit"[5] becomes irrelevant. What is being suggested here is the *adoption of NF as the sole tax entity*, outside of business enterprises, *for all direct taxes*.

As for the abolition of HUF as a tax entity, whatever be its historical antecedents, it is well recognised that presently HUF is primarily a tax avoidance device.[6] The mere fact that the law in regard to HUF as a taxable unit "... is now reasonably well settled by several judicial pronouncements..."[7] cannot become an insuperable barrier to a long overdue tax reform.

II

Some Consequences

Let us now turn to some of the important consequences of treating NF as the tax entity. As noted previously, the proposal would imply the replacement by the NF of 'individual' and 'HUF' as tax entities. The revenue and equity implications of eliminating HUF as a tax entity have been examined earlier by Gulati, among others.[8] As such, we are concentrating on the implications of treating the incomes of all members of an NF as a single aggregate, following the elimination of individuals as assessment units.

In assessing the revenue consequences of the aggregation of incomes of the members of an NF, we restrict ourselves to the salaried class though in principle the sources of income are immaterial in this context. We focus our attention on the class of nuclear families with salaried members both for reasons of convenience as well as for the reason that some of the issues germane to the problem are particularly interesting and better understood in this case.

Equity: There are three considerations which may motivate a tax reform. These are: equity, revenue and incentives. Consider equity first. Under the existing tax arrangements each salaried assessee enjoys the benefit of the following exemptions and deductions.

(i) House rent allowance (HRA) upto a maximum of Rs 3,600.
(ii) Standard deduction (SD) on a two slab basis upto a maximum of Rs 3,500.
(iii) Income from approved investments (IAI) such as interest on bank deposits, dividends from units upto Rs 5,000.
(iv) Approved Savings (AS) such as contributions to PF, LIC, CTD, on a three slab basis upto a maximum of Rs 30,000 or 30 per cent of income, whichever is less.
(v) On the taxable income, net of (i)-(iv), a basic exemption of Rs 8,000 or Rs 10,000.

Depending upon: (i) the composition of gross family income in terms of (a) the two earners and (b) salary-non-salary income, and (ii) the extent of tax deductible savings, it is possible that an NF with two salaried earners could enjoy an aggregate annual income of about Rs 43,000 without having to pay any income-tax whatever.[9] In contrast, a single earner NF with the same level of income would have to pay a tax-cum-surcharge of about Rs 2,000. Given the progressivity of the rate structure of income-tax, the aforesaid disparity in tax incidence, as between the two types of NFs, would be larger at higher income levels.

Revenue Consequences — Methodology: In order to provide a meaningful estimate of the revenue consequences of the present proposal in the case of NFs with two salary earner members we need to know:

(i) The total number of NFs whose taxable income is expected to exceed the current exemption limits.
(ii) The distribution of this total number of NFs across different gross (pre-deductions-pre-tax) income ranges.
(iii) The precise magnitude of allowable deductions/exemptions in order to arrive at the taxable income of each NF. This, in turn, requires an assumption regarding the distribution of the total income of an NF between the two earners and an assumption regarding the saving behaviour of the NFs.

Taking up (i) first, our basic assumptions are that all women employees are married and that the income of the husband would be somewhat higher than that of the wife. It is also postulated that this income differential increases with the level of the wife's income. This would follow from the sociological reality that people, especially in the salaried class, marry within broadly the same socio-economic group and that husbands are generally older by a few years. Following this line of reasoning, we need consider only such women employees as earn at least Rs 6,500 per year.[10] From the aforesaid assumptions, the number of such women employees would simultaneously give us the total number of NFs in the salaried class whose taxable income is expected to exceed the exemption limit.

As for (ii), assuming a plausible size-distribution of gross income for the women employees we get the number of women employees in different income ranges. This, together with our pairing assumptions would give us the number of NFs in each gross income range. Assuming that HRA and incomes from other sources do not exceed the permissible tax exemption limits,[11] we are able to obtain from the preceding step both the distribution of NFs by gross income ranges and the split of aggregate income of NFs in each class as between the two spouses.

Having determined the number of NFs with two salaried earners and their distribution across income ranges the next question relates to the tax treatment of these NFs. Two issues of special significance arise in the present context. Since NF is treated as a single tax entity, it would, strictly speaking, be entitled to only one standard deduction (SD) — by way of expenses relating to work and a single deduction for approved savings (AS). However, it might be argued that such a tax treatment is unfair, in that, it does not take into account the real additional

TABLE 1: ESTIMATED NUMBER OF WOMEN EMPLOYEES IN ORGANISED SECTOR WITH EARNING OF Rs 6,500 OR MORE PER ANNUM

As on March 31, 1976

Occupation/Profession/Industry	Number (in 000s)
Banking, LIC and other insurance companies.	33.40
Air transport	2.30
University teachers	18.88[1]
Secondary school teachers	158.33[1]
Central government and quasi-government agencies	4.99[2]
State governments and local bodies	8.11[3]
Engineering, architectural & local services	1 30
Allopathic physicians and surgeons employed in organised sector	6.50[4]
Private (allopathic) medical practitioners [other than those covered under (8)]	44.79[5]
Railways	3.06[6]
Research and scientific services	4.00[7]
Total	285.66

This total for March 31, 1976 can be reasonably expected to be roughly three lakhs as of date.

Notes: (i) The number of university teachers and secondary school teachers is obtained by applying the proportion of such teachers in the total of women employees in "educational services", separately for the public and private sectors (1972-1973) to the total of women employees in "educational services" as on March 31, 1976.

(ii) Here we take 10 per cent of women employees in Central government and 15 per cent of women employees in quasi-government agencies. In this context note that the proportion of employees (both sexes together) drawing a basic pay of Rs 400 or more per month was roughly 20 per cent and 30 per cent in these two types of agencies.

(iii) Only 5 per cent of women employees in state governments and local bodies are included.

(iv) The number of women allopathic physicians and surgeons employed in organised sector in 1972-73 (occupational and educational pattern in public sector and private sector), is placed at 5,500. As on March 31, 1976, this can be expected to be 6,500.

(v) The Draft Five Year Plan 1978-83, estimates the total stock of employed Medical graduates and post-graduates in 1977-78 at 170,980. We take 30 per cent of this stock to consist of women doctors. From the total so obtained, we deduct the estimated number of women physicians and surgeons employed in the organised sector.

(vi) 15 per cent of women employees in railways (like women employees in other quasi-government agencies) are included here.

(vii) 50 per cent of women employees in Research and Scientific Services in Central and quasi-government agencies are included (we exclude laboratory assistants who constitute roughly 50 per cent of the total).

Sources: (1) The Primary data source is the DGET "Employment Review 1975-76" (mimeo).

(2) DGET "Occupational and Educational Pattern in India", Public Sector (1972) and Private Sector (1973) (mimeo)

(3) DGET : Census of Central Government Employees June, 1978.

costs that are entailed by the fact of a second member of the NF going to work. This argument suggests that separate SDs be allowed on the two incomes.[13] As against this one might take the view that there are certain economies of scale on the expenses in question which in turn would lead to a prescription that the allowable SD be between the two limits. Further, one might argue that, some of the expenses consequent upon both spouses working — e g, hiring of a servant — are part of a larger choice between leisure and other types of consumption. If this is accepted, it would follow that no deduction specific to these expenses, especially if these are claimed in addition to SD, need be admitted.[13] In the subsequent exercise, however, we assume that separate SDs would be permitted on the two incomes, each upto the existing permissible limit.

With regard to the treatment of approved savings (AS) the notion that such a deduction be allowed only once per tax entity may be interpreted in either of two ways. One, that such deduction be permitted on the larger of the two incomes; and two, that it be permitted on the aggregate income. In both cases the allowance for AS is subject to the existing upper limits. The other extreme would be to permit deductions on this account separately on the two incomes, each being subject to separate upper limits as per existing rules. Since we see no particular rationale for the last mentioned alternative we take the intermediate position, i e, a single deduction as per existing rules, but on the aggregate income.[14]

In moving from the general principles to the specific task of evaluating the taxable income, we are left with the problem of specifying a realistic saving behaviour. As noted previously, if the NF wishes to maximise tax avoidance by making appropriate savings then it would have to save 30 per cent of its income. This is clearly unrealistic at relatively low income levels. In this exercise, we assume a graduated savings function in which 30 per cent of the income is saved only at incomes equal to or exceeding Rs 41,000 pa (excluding HRA and income from other sources).

In constructing the graduated savings function, we bear in mind the usual PF obligations, normal life insurance cover, and plausible CTD contribution.[15] Further, saving of an NF are assumed to be related to its aggregate income rather than being the sum of the two savings each related to the corresponding income.[16]

Revenue Consequences — Computational Aspects: For the calculation of the revenue gain following from the replacement of the individual earner by NF was the unit of tax assessment, in respect of NFs with salaried earners, we have estimated the total number of women employees with an annual income of Rs 6,500 or more to be roughly 3 lakhs (see Table 1). Included in this set[17] are:

(a) All employees in
- (i) banking services
- (ii) LIC and other insurance companies
- (iii) university teaching
- (iv) secondary school teaching
- (v) air transport
- (vi) medical profession (including self-employed doctors)
- (vii) engineering, architectural and legal professions and,

(b) Varying proportion of employees in
- (i) Central government agencies (10 per cent)
- (ii) quasi-government agencies (15 per cent)
- (iii) state governments and local bodies (5 per cent)
- (iv) railways (15 per cent) and,
- (v) research and scientific services, employed by the Central government, quasi-government agencies (50 per cent)

Having obtained the number of women employees with an annual income of Rs 6,500 or more, the next step is to distribute this total number across different ranges of income of women employees, taking Rs 22,000 pa as the upper limit.[18] In the absence

TABLE 2: EXISTING AND PROPOSED TAX LIABILITIES (INCOME-TAX PLUS SURCHARGE)

Wife's Income	Husband's Income	NF Income	Existing Tax-Liabilities of the NF	Tax-Liabilities If NF Is the Tax Entity
7,000	8,000	15,000	Nil (Nil)	423 (2.82)
8,000	10,000	18,000	Nil (Nil)	711 (3.95)
9,000	11,000	20,000	19 (0.01)	728 (3.64)
10,000	12,000	22,000	69 (0.31)	1149 (5.22)
11,000	14,000	25,000	381 (1.52)	1259 (5.04)
12,000	15,000	27,000	578 (2.14)	1551 (5.74)
13,000	17,000	30,000	984 (3.28)	1953 (6.51)
14,000	18,000	32,000	1211 (3.78)	2288 (7.13)
15,000	20,000	35,000	1510 (4.31)	2846 (8.13)
16,000	21,000	37,000	1765 (4.77)	3335 (9.01)
17,000	22,000	39,000	2062 (5.29)	3864 (9.91)
18,000	23,000	41,000	2276 (5.55)	4294 (10.47)
20,000	25,000	45,000	2467 (5.48)	5371 (11.94)
22,000	28,000	50,000	3255 (6.51)	7183 (14.37)

Notes: (i) The numbers within brackets relates to the effective average rate of tax if NF is treated as the tax entity as percentage of income.

(ii) The incomes in questions are exclusive of HRA and income from approved investments (which are currently tax-exempt upto 30 *per cent* of the income and Rs 5,000 respectively, *per assesee*).

(iii) The NFs are assumed to save in approved (tax-deductible) forms on the following scale; by reference to their aggregate income.

Income Range	PF (Per Cent)	LIC (Rs)	CTD (Rs)	Savings Rate at Mean Income (Per Cent)
7,000-11,000	4	350	Nil	7.89
12,000-15,000	5	500	300	10.93
16,000-17,000	5	600	400	11.06
18,000-19,000	6	800	400	12.49
20,000-22,000	7	1200	600	15.57
23,000	8	1200	600	15.83
24,000		20 per cent of Income		
25,000		22 per cent of income		
27,000		24 per cent of income		
30,000-32,000		26 per cent of income		
35,000-39,000		28 per cent of income		
41,000 and above		30 per cent of income		

(iv) Deductions on approved savings allowed only once per NF as per existing limits.

(v) Standard deductions allowed separately on the incomes of wives and husbands, each as per existing two-slab scale and as per existing limits.

of any information specific to this issue our approach has been to use a plausible theoretical distribution for this purpose. Of the several theoretical distributions one could use, we have chosen what is perhaps the simplest and the least data demanding, namely, the Pareto distribution:

$$N_X = Ax^{-\theta}$$

where x is the level of income, N_X is the number of earners with incomes greater than or equal to x and, A and θ are the distribution parameters.

Having fixed the lower limit to income and a value of θ the given model would help one distribute a given population over different income ranges. Further, varying values of θ would generate distributions with different degrees of concentration at lower income ranges.

As a first step, we examine the appropriateness of this model and obtain an estimate of θ. For this the model is fitted to the observed distribution of individual assessees by gross salary incomes for 1976-77.[19] The estimated relationship in double-log formulation, which turned out to be

$$\log N_X = 11.2358 - 0.6279 \log x$$
$$(t = 5.07) \qquad \bar{R}^2 = 0.63,$$

is a good fit by all criteria. The estimated value of θ is 0.6279.

Following from the above, it would appear reasonable to assume that the size-distribution of gross incomes of women employees also follows a pareto distribution — but with a different parameter value to allow for the well-recognised fact that the incomes of women employees are likely to be more concentrated at lower levels of income than for 'all' salaried individuals. Therefore, in applying the pareto distribution to women employees we have assumed θ to be nearly four times as large as the estimated θ, i e, a θ equal to 2.5 The implication of *assuming this high value of θ may be* appreciated from the fact that, whereas in the observed distribution of all individual assessees nearly 21 per cent have incomes exceeding Rs 19,700, the corresponding proportion in the assumed distribution of women employees would be only a little over 7 per cent.

Following the earlier discussions we have adopted a pattern of pairing incomes of husbands and wives such that the difference between the two incomes varies from Rs 1,000 (corresponding to the wife's income of Rs 7,000) to Rs 6,000 (corresponding to the wife's income of Rs 22,000).

Based on these empirical assumptions, the weighted average[20] of the differences between the current tax liability and that entailed by treating NF as the single tax entity amounts to Rs 963 per NF in this category (see Tables 2 and 3). With roughly three lakhs of women employees and hence of such NFs we get a rough estimate of revenue gain equal to Rs 29 crores per annum. In assessing this order of revenue gain, it must be noted that the total gross tax demand on salary assessments in 1976-77 was only Rs 159 crores.

Note, further, that our estimate of the revenue gain is likely to be an underestimate for several reasons. Thus,

(i) To the extent that other incomes exceed exemption limits, which is possible in case of high income NFs, our estimate of revenue gain has a downward bias arising both from underestimation of taxable income and possible changes in the marginal tax rate.[21]

(ii) In so far as the income of the husband exceeds that of his wife by a much larger margin than that assumed, which is possible in case of higher income ranges, the revenue gain is understated.

(iii) Again, no account is taken of non-employee women who may be earning non-salary income exceeding the present exemption limit.

Aggregate Revenue Gains — An Estimate: It is important to emphasise that the revenue gains discussed so far reflect only a partial consequence of shifting to NF as the tax entity. In particular, even within the sphere of income-tax, the revenue gains following from the abolition of HUF as a separate tax entity could be quite large. Gulati, who has examined this question in some depth, working with 1967-68 distribution of assesses and 1972-73 tax rates, has shown that the revenue gain could be of the order of Rs 45 crores. Since then, the number of assessee HUFs has increased by 57 per cent — with the increase being very pronounced (100 per cent or *more) in the higher income brackets.*

TABLE 3 : DISTRIBUTION OF WOMEN EMPLOYEES ACROSS INCOME LEVELS AND WEIGHTED AVERAGE OF DIFFERENCE IN TAX-LIABILITIES

Income-Range	Mean Income	Proportion of Women Employees in Each Income Range	Difference in NFs tax liabilities (in Rs)	Contribution to Weighted Average Increase in Tax-Liabilities per NF (in Rs)
6,500- 7,500	7,000	0.3009	423	127.28
7,500- 8,500	8,000	0.1877	711	133.45
8,500- 9,500	9,000	0.1242	709	88.06
9,500-10,500	10,000	0.0857	1080	92.56
10,500-11,500	11,000	0.0613	878	53 82
11,500-12,500	12,000	0.0454	973	44.17
12, 500-13,500	13,000	0.0341	969	33.04
13,500-14,500	14,000	0.0263	1072	28.19
14,500-15,500	15,000	0.0207	1336	27.66
15,500-16,500	16,000	0.0165	1570	25.91
16,500-17,500	17,000	0.0133	1802	23.97
17,500-18,500	18,000	0.0109	2080	22.67
18,500-21,500	20,000	0.0230	2904	66.79
21,500 or above	22,000	0.0502	3898	195.68
Weighted average increase in tax-liabilities per NF with two earners				963.25

Notes: (i) The mean income referred to in Col (2) is an assumed mean income rather than the mean income consistent with the assumed value of θ. This is done purely to facilitate the computation of tax liabilities.

(2) Column (3) has been arrived at by assuming a Pareto distribution with $\theta = 2.5$ (See text).

So that the revenue gains following from abolition of HUF as a tax entity could now lie in the neighbourhood of Rs 100 crores.

In sum, therefore, the revenue gain, from income taxes alone arising from treating NF as the tax entity would amount to as much as Rs 130 crores. As noted previously, NF should be the tax entity in respect of other direct taxes as well. Such an extension of this logic would yield further revenues.

III

Review of Deductions and Exemptions

We have so far concentrated on the logic and implications of what ought to be the tax entity, taking as given the existing tax provisions in the matter of rates, exemptions and deduction. However, as has been noted in the draft five year plan 1978-83, page 59:

> "the various concessions in the tax structure other than those which *stimulate middle income savings* .. need to be reviewed and if necessary withdrawn ...." (emphasis added).

Let us, therefore, consider the provisions which "stimulate middle income savings". The current tax provisions in this context relate to:

(i) exemption of income from approved investments (IAI) upto a ceiling of Rs 5,000.

(ii) deduction of approved savings (AS) upto 30 per cent of income or Rs 30,000, whichever is less.

Two aspects of these provisions are important. Even though they appear to be symmetric across income groups this is not really true. (Given a realistic saving function, such as the one considered by us earlier, the provisions in question are inequitous in incidence. For, it is unwarranted to assume either that all assessees irrespective of their incomes will by saving 30 per cent of their incomes or, that they can have a large enough asset base to yield additional incomes of up to Rs 5,000 p a. Notice that the assets in question must be in addition to those arising from a cumulation of approved savings which do not in general yield current incomes. Therefore, these provisions, *ceteris paribus*, increase the degree of inequality in the distribution of after-tax incomes.

Further, in so far as these provisions will be fully exploited only at high income-asset levels the very rationale of these exemptions/deduction in their present form is open to doubt. The basic question is as to what constitutes the middle income class and, what this class can reasonably be expected to save under the most favourable circumstances. At the other end of the income distribution one may ask whether any incentives are required to stimulate savings. Looked at from this angle there appears to be a strong case for a drastic reduction in the limit of allowable deductions on approved savings from the present level of Rs 30,000 which at 30 per cent rate of saving would correspond to an income of Rs 1 lakh to say, Rs 3,000. The latter figure would be consistent with an annual income of Rs 10,000 and a 20 per cent rate of saving. Since the avowed purpose of the provision is to stimulate savings it makes better sense that the ceiling is in absolute terms rather than as a proportion of income. On a parallel reasoning there appears to be a case for lowering the ceiling on income from approved investments exempt from tax, to half its present level.

It may be suggested that the purpose of the current tax provisions relating to AS and IAI are designed to serve yet another objective namely to induce savers to hold their savings in a particular form. This is motivated by the desirability of ensuring a greater social control over these savings and of reducing the liquidity profile[33] of the savings and thereby of cumulated assets. These objectives would, in our view, be served better by directly adjusting the yield-risk liquidity package on alternative assets rather than indirectly through inequitous tax concessions. Further, such adjustments would be more effective by virtue of their being explicit. In this context one may recall the dictum, a la Tinbergen that "multiple objectives require multiple policy instruments".

To summarise:

(i) An important step towards a rational system of direct taxes is to define the tax entity in a logically consistent manner. It is suggested that the nuclear family (NF) is the logical tax entity outside of the business enterprises, incorporated or otherwise.

(ii) The consequences of the above proposal is the elimination of the HUF as well as of the individual assessee as tax entities. This in turn would imply that not only are incomes of all earners in an NF aggregated but also that all incomes of all earners in an NF are aggregated for tax purposes.

(iii) The suggested change in the notion of tax entity renders the tax system more equitous and also generates significant additional tax revenues (of the order of Rs 130 crores) even with the existing tax rates and provisions for exemptions and deductions

(iv) Finally, a review of the provisions for exemptions/deductions also suggests the need for lowering the exemption limits on income from approved investments and also a drastic lowering of the ceiling on allowable deductions on account of approved savings.

Notes

[The authors are grateful to Suresh Tendulkar for useful comments.]

1 See I S Gulati, 'HUF Tax Avoidence Revisited', *EPW* February 17, 1973. For some interesting findings in this context see also the Wanchoo Committee Report. The multiplicity of assessment units is made possible through a partitioning (which may be largely notional) of the assets of the joint family and a formal assignment of each portion to a separate HUF.

2 Clearly, some 'abridgement' may be entailed in cases where no expenditure decisions relating to the family are taken jointly ie, each spouse acts as a totally independent income-expenditure unit. Whether the collection of such independent income-expenditure decision making units can at all be deemed to be a single family is an open question. In this context, the question of treating income from the so-called 'Streedhan' differently does not arise since the nature of the income sources (whether human capital or tangible assets) or how the legal titles to their ownership are distributed between members of the NF are irrelevant as long as the income expenditure decisions are jointly taken. For a different view, see Direct Tax Laws Committee [Chokshi Committee]. Final Report, September 1978, para 1—11. 2, page 74.

3 "It [the proposal to treat family as a taxable unit] may also be detrimental to the interests of a large number of middle class families where women have to work to supplement the family income", Direct Tax Laws Committee. *Ibid.*

4 It must be emphasised that the income levels referred to are exclusive of (i) the house rent allowances and (ii) incomes from interests, dividends, UTI etc, which are tax exempt upto Rs 3,600 and Rs 5,000 respectively for each assessee. Thus, the corresponding aggregate income could be as high as Rs 37,200 for a family of two earners.

5 Direct Tax Laws Committee, *Ibid.*

6 As the Direct taxes Enquiry [Wanchoo] Committee observes "We feel convinced that the Hindu Undivided Family as a unit of assessment is retained in cases only when it enables the persons to reduce their tax liability and that in other cases it is promptly partitioned without consideration of sentiments coming in the way." quoted by Gulati, *op cit.*

7 Direct Tax Laws Committee, *Ibid.* In this context see also I S Gulati, 'Agenda for Tax Base Reform', *EPW*, May 15 1971, and the Raj Committee Report on Agricultural Taxation.

8 I S Gulati and K S Gulati, "The Undivided Hindu Family: A Study of Its Tax Privileges", Asia Publishing House, 1962; I S Gulati 'Agenda for Tax Base Reform' *EPW*, May 15, 1971; and I S Gulati 'HUF Tax Avoidance Revisited', *EPW*, February 17, 1973.

9 This will eventuate if the two assessment units enjoy each a salary income of Rs 15,000 (over and above an HRA of about Rs 1500, an income of Rs 3,000 on account of interest and dividends, and another Rs 2,000 from the Unit Trust of India; and provided they take full advantage of the permitted deductions for approved savings.

10 Given the standard deductions and exemptions allowed currently, incomes of NFs with women earning less than Rs 6,500 per annum would generally be below the taxable limit.

11 This appears to be a reasonable assumption in view of the fact that for the income ranges under consideration the permissible tax exemption limits for these items are fairly high.

12 Given the existing two slab scheme there could be the further problem of whether the SD be allowed on the two incomes separately or on the aggregate income even if one accepts the claim for SDs on the two incomes.

13 Expenses such as those arising from the hiring of a servant are typically a function of the level of aggregate income rather than arising simply from the fact of both spouses going to work. This is testified to by the fact that there exist a large number of families with relatively low aggregate income in which both spouses work and yet no servants are hired and, conversely.

14 The entire question of the logic of the current provisions regarding deductions on account of AS is examined later in this paper.

15 Thus, for instance, we assume that NFs with incomes between Rs 7,000 and Rs 11,000 would save roughly 4 per cent as PF, and Rs 350 p a as LIC premium (which would provide a life cover of roughly Rs 10,000 and nothing by way of CTD. Correspondingly for an NF with income in the range of Rs 20,000 to Rs 22,000 the PF contribution would be at the rate of 7 per cent, LIC premium would be Rs 1,200 p a and CTD contribution equal to Rs 600 p a.

16 For example, an NF with an aggregate income equal to Rs 20,000 made up of Rs 9,000 and Rs 11,000 is assumed to save Rs 3,200 whereas the savings on individual incomes, as per the scale adopted, would add up to Rs 1,500 only. This would also make it clear that since savings are tax-deductible, our assumptions would, *ceteris paribus*, tend to lower the tax burden on an NF with two earners.

17 This is a subset of all women employees in the organised sector who number roughly 25 lakhs.

18 Note that the income in question is only salary income exclusive of HRA. This assumed upper limit is used only to compute the tax liabilities of NFs with incomes of Rs 50,000 or more.

19 All-India Income Tax Statistics, 1976-77, July 1978, Statement No 5A, page 29.

20 Weights in question are given by the proportion of women in each income group.

21 This underestimation assumes a greater operational significance if we carry the logic of treating NF as a single tax entity to imply that tax exemption limits on income from approved investments be Rs 5,000 (as in the case of single earner NF).

22 This follows from the fact that AS involve relatively long term maturities with limited withdrawal facilities before maturity.

To Butcher or Not to Butcher

Cattle Holdings and Milk and Meat Production in Kerala

K Narayanan Nair

Advocates of banning of cow slaughter, in support of which demand Vinoba Bhave has started a fast from April 22, like to claim that their case rests on the rational economic argument that slaughter of cows reduces milk production and harm the livestock economy and agricultural production.

This paper seeks to examine this argument with reference to Kerala, one of the two states which have so far refused to impose a total ban on slaughter of cows. The author discusses the extent of bovine slaughter in Kerala, the factors responsible for the increase in slaughter in recent years and the effects of slaughter on the size and composition of the state's bovine population.

Cattle slaughter in Kerala, the author concludes, has resulted in a rise in milk and meat output and a ban on slaughter of cattle, especially cows, will adversely affect on-going livestock development projects and the weaker sections of the population.

Introduction

VINOBA BHAVE is a respected national leader. He has threatened to go on an indefinite fast from April 22. His reason is simple. There is cow slaugher in Kerala and West Bengal; this adversely affects agricultural production and is, therefore, disastrous for the survival of the human population. He has, therefore, appealed to the two state governments to impose a total ban on cow slaughter.[1] Should they fail to comply with his demand, he will go on fast till the demand is granted. The Kerala and West Bengal governments have already expressed their inability to impose a legal ban on cow slaughter. The followers of Vinoba Bhave are busy organising public opinion in support of a total ban on cow slaughter, though their chances of success have so far been bleak.[2] At least in Kerala, public opinion is strongly against the movement. This is evident from the numerous write-ups and articles appearing in prominent local newspapers.[3] The whole campaign seems to have been based on pseudo-religious arguments and appeals. Neither Vinoba Bhave nor his followers have succeeded in giving a rational economic justification for banning cow slaughter.

The holy cow has remained for long a fertile object for Hindu religious leaders and politicians with an interest in diverting public attention from pressing social and economic problems of the country. They have often misinterpreted theories about the origin and evolution of the sacred cow and thwarted the emergence of a rational livestock adjustment mechanism in the country. They even succeeded in smuggling the sacred cow concept into the directive principles of the Constitution (in the name of cow protection) and winning over most of the state governments (except those of Kerala and West Bengal) to implement a total legal ban on cow slaughter.[4] Vinoba's vow to stake his life to mend the ways of these two *mleccha* states marks the logical culmination of this triumphant march of vested interests.

It is high time to rid this controversy of its emotional overlay and face the facts squarely. For instance, what is likely to be the impact of cow slaughter on the livestock economy and on the agricultural production system? Available evidence from Kerala shows that the existence of an efficient mechanism for elimination of unproductive animals has immensely promoted the state's bovine economy. This paper seeks to explain the favourable impact of cow slaughter on the livestock economy and agricultural production of Kerala. We begin our analysis with a discussion of the extent of bovine slaughter in Kerala; then we go on to a brief discussion of the factors responsible for the increase in cattle slaughter in recent years; in the last section, the effect of slaughter on the size and composition of bovine herds in the state is examined.

Scale of Slaughter

Statistics on the slaughter of bovines in Kerala are available from the mid-fifties.[5] They relate to the number of animals slaughtered in the licensed slaughter houses in urban and semi-urban areas. In 1955, about 1.3 lakhs bovines were reported to have been slaughtered in the licensed slaughter houses in this state, of which about 70 per cent were cattle and the remaining buffaloes. Of the cattlestock slaughtered, nearly 60 per cent were adult males and 30 per cent adult females and the remaining calves. In the buffalo stock, 80 per cent were adult males, 15 per cent adult females and the rest calves.

By mid-seventies the number of bovines slaughtered showed a significant increase, the pattern also changed. The number of bovines rose from 1.3 lakh in mid-fifties to 2.5 lakh by mid-seventies. But the proportions of cattle and buffaloes slaughtered remained almost unchanged. However, the proportion of adult males has shown a significant increase.

The above findings suffer, however, from severe limitations: (a) The number reported by the licensed slaughter houses excludes animals slaughtered in rural areas. In fact the total number of animals slaughtered in the state is likely to be several times larger. Besides, the statistics do not cover all the urban and semi-urban slaughter houses. For instance, out of the 930 Panchayat centres in existence in the early seventies, slaughter house statistics were not available from nearly 50 per cent of the centres. (b) For slaughter of animals within the premises of the slaughter houses, the butchers are under obligation to pay a small levy on each animal slaughtered for them. Though the levy itself is nominal, the butchers show a tendency to under report the number of animals slaughtered to escape any resentment likely to be aroused in the public mind if actual numbers were reported. (c) The slaughter of small calves and diseased animals and cows in the reproductive age groups is officially prohibited, but is taking place to a certain extent.[6] For these reasons the reported number of bovines slaughtered in the slaughter houses would form only a small fraction of the actual number of animals slaughtered. Yet the upward trend in the figure may be taken to be an indicator of the rapid increase in bovine slaughter taking place in the state. However, they may not give a correct picture of the

1977	11.60	2.50	14.10

patterns of slaughter, particularly because of the legal ban on the slaughter of certain types of bovines.

Because of such limitations of the data, we have attempted to prepare alternative estimates of bovine mortality using data from Livestock Censuses and on the population of bovines imported from other states into Kerala (see Appendix). The estimated number of deaths of bovines is given in Table 2 The estimated number of deaths of bovines has two components: death due to (a) slaughter and (b) natural reasons like diseases. Currently no detailed information is available on the relative importance of these two processes on the rate of bovinestock adjustment. According to a survey conducted in the mid-sixties, about 15 per cent of bovine deaths were due to nautral reasons and the rest due to slaughter.[7] It is also reported that over 80 per cent of calf mortality is due to diseases. Our own investigations into the causes of bovine mortality in a couple of villages also lend support to the findings of the earlier survey.[8] Therefore, by excluding calf deaths from total bovine deaths, an approximate idea of the size of the bovine herd slaughtered might hopefully be obtained.

The estimated number of bovine deaths in early sixties (1961-62) was 8.7 lakhs. Out of this nearly 80 per cent was cattle and the rest buffaloes. If we exclude the estimated number of calf deaths from the total deaths of bovines, the number of animals slaughtered comes to about 8 lakhs. The estimated number of deaths of bovines in the mid-seventies was about 14 lakhs. Out of this, nearly 1.5 lakh deaths were of calves and the rest may be taken to be the number of bovines slaughtered. Thus, within a decade, the total number of deaths of bovines in the state by slaughter may have increased by 65 per cent. This finding is consistent with the trend observed in the number of bovines slaughtered in the state as reported by the slaughter house statistics.

The reliability of the above estimates may be verified by comparing them with those of the supply of hides and skins in Kerala. Usually one piece of hide or skin is obtained from one dead animal and hence the total number of hide and skins supplied in the state will be roughly equal to total number of deaths of animals. Estimates of the supply of raw hide and skin in the state are available from a survey conducted in the mid-sixties by the Central Leather Research Institute.[9] According to this survey, 6.5 lakh cattle hides and 1 8 lakh buffalo hides were supplied during the year in the state.[10] These figures indicate deaths of 8.3 lakhs bovines in Kerala. If we exclude calf mortality from our estimate of 9.9 lakh deaths in the same year, the resulting figure tallies broadly with the survey estimates.

Estimates of the outturn of meat in the state is given in Table 3. The esimates are arrived at by applying the yield rate of meat per standard cattle and buffalo suggested by the CSO for purposes of estimating meat output in the state.[11] The estimated outturn of meat in the early sixties was about 82,500 tonnes. Out of this nearly 60 per cent was obtained from cattle, another 21 per cent from buffaloes and the rest from other source like poultry, goat and pig. The total meat output increased to 1,30,000 tonnes by mid-seventies, marking an increase of 55 per cent in a period of one and a half decades. The share of cattle meat and buffalo meat in the total meat output has been increasing at a more rapid rate, the share of buffalo meat output increasing faster rate than cattle meat.[12]

CAUSE OF SLAUGHTER

We have discussed elsewhere the major causes for the rise in the scale of bovine slaughter.[13] They include the following:

Fish is the major source of animal protein in Kerala. As a consequence of the rising demand and falling per capita availability, fish prices have been continuously rising.[14] This factor may have introduced a shift in consumption pattern of animal protein from fishery sources to those based on land namely meat, milk and egg. In the land-based animal protein basket, the major source of supply is bovines, in the form of milk and meat Other types of livestock supplies form only a very small fraction of the total supply of animal protein and their prices also have been rising at a rapid rate. Since protein from bovine source has become cheaper than that from fish and other livestock sources, the con-

Table 3: Estimated Meat Output in Kerala

(000 tonnes)

Year	Cattle	Buffalo	Other Meat	Total
1961	52.2	17.37	5.90	82.5
1966	57.1	18.00	7.71	90.5
1972	77.7	27.40	8.77	12.5
1977	88.7	31.50	9.20	129.4

Note: Output of cattle meat and buffalo meat are obtained by applying the standard yield rates of meat per cattle and buffalo used by the Central Statistical Organisation to the estimated number of deaths in these species converted into adult equivalent units. The calf deaths are not included in the meat output estimate. The youngstock is converted into adult equivalent units by taking one youngstock to be equal to half adult stock. The following are the CSO rates of meat output: cattle 102 kg and buffalo 156 kg. The output of other meats are the official estimates of these items.

sumption pattern of animal protein may have shifted more to bovine sources. These factors, combined with the growth in population and income, have led to a high rate of growth in the demand for beef and milk.

The growth in the demand for milk has raised milk prices much more rapidly than input prices, resulting in better feeding and management of milch animals. Efforts made during the last two decades to raise the genetic potential of milch animals through cross-breeding programmes have resulted to the addition of large numbers of new herds of cross-bred animals in the milch animal population.[15] Thus the better feeding and breeding facilities have resulted in a rise in the productivity of milch animals reckoned in terms of calves and milk.[16] The natural rate of increase in the milch animal population has been rising; the total milk production has also been on the increase because of these developments. At the same time, since the supply of feed in the state has been limited, intensive efforts for augmenting milk production resulted in intensification of pressure on available feed resources for milk production and for rearing draft animals. In this process, the choice is seen to have fallen on rearing more milch animals by reducing the size of the draft animal stock, by increasing the rate of utilisation of draft animals as well as substituting human labour for draft power in land preparation.[17] The rise in the beef price as a result of the growth in demand has also contributed to the reduction in the draft animal stock. The rise in the beef price led to increased in the price of slaughter animals and this in turn stimulated the culling of animals (including surplus draft animal stock) at a rapid rate, thereby raising the overall rate of bovine slaughter.

Incidence of Slaughter

What are the effects of the rise in the incidence of slaughter on the size and composition of bovine stock? To understand this it is essential to examine the pattern of survival (or mortality) of bovines by age and its trend over time.[18] The method of estimation of the survival rates is given in the appendix.

The overall bovine mortality rate in Kerala increased from about 22 per cent in the early sixties to 30 per cent by mid-seventies. The corresponding increases in cattle and buffalo mortality rates were from 21 per cent to 28.7 per cent and from 23 per cent to 34.5 per cent respectively, (See Table A of Appendix). These estimates are broadly consistent with the mortality rate of bovines reported in an earlier study.[19] According to this study the bovine mortality rates in Kerala were 21 per cent for cattle and 33 per cent for buffaloes. These rates are much higher than the corresponding figures for the country as a whole, about 10 per cent for cattle and 17 per cent for buffaloes

Estimates of calf mortality rates are given in Table B in the appendix. The estimated number of cattle calves increased from 5.7 lakhs in the early sixties to 8 lakhs by mid-seventies. The estimated number of calf deaths increased from 0.4 lakh to 0.8 lakh during this period, due mainly to the increase in the number of deaths of male calves. Almost all the female calves born have survived the (0-1) year (calf age group) and joined the young stock in (1-3) year age group. But in the case of male calves a small proportion (about 16 per cent in early sixties) did not survive the calf age group It is also to be noted that in the last one and a half decades, especially in the last quinquennium, the survival rate of male calves has improved significantly In the case of buffaloes, the number of births has increased from 0.5 lakh in the early sixties to nearly 7 lakhs by mid-seventies. About 60 per cent of the calves born are seen to survive to the higher age groups. Between males and females, no significant variations in the pattern of survival are observed

In order to estimate the survival rate of young stock cattle and buffaloes we have used their respective population size in the (0-1) and (1-3) age groups. The estimated number of death in youngstock and their survival rates are given in Table C in the Appendix. In the early sixties about 1.9 lakh male youngstock and 1 5 lakh female youngstock cattle died in the state. The number of deaths in male youngstock has steadily increased over the years and by mid-seventies it was about 2.4 lakhs. The number of deaths in female youngstock increased from 1.5 lakh in early sixties to 1 8 lakh by mid-seventies. Estimates of

Note : Sex ratio is defined as the number of males per 100 females.
Source : Livestock Censuses.

the survival rates of male youngstock showed a continuous decline over the years. But in the case of females the survival rate has increased significantly. For buffaloes the estimated number of death in youngstock in early sixties was about 0.20 lakh and it marginally increased to 0.3 lakh by mid-seventies. The survival rates of male and female youngstock do not show any significant change over the years.

Since the mortality rates of adult cattle and buffaloes vary significantly with rise in age, it is not possible to use the census data for estimating the morality rate of adult stock. The only possible method of getting some idea of the change in mortality rate of the adult stock is to compare the average life span of adult animals over the years. This can be computed from the single-year age-distribution of cattle and buffalo population for the mid-sixties and mid-seventies from two rounds of the National Sample Survey.[10] The single-year age-distribution data for adult cattle in the mid-sixties show a heavy concentration in the 5 to 11 age group. But by mid-seventies, the concentration of animals in the different age groups is seen to have shifted significantly to the lower age groups, the range being 5 to 8 years. The average life span of adult females declined from 8.5 years to 6.3 years by mid-seventies; in other words there was a downward shift of about 35 per cent in the life span of adult female indicating an increase in the rate of their culling. In the case of adult males the concentration of animals was mainly in the age group 5 to 11 with an average life span of 9.8 years during mid-sixties and 8.9 years by mid-seventies.

How does the trend in the pattern of survival rates affect the growth rate of cattle population? In the case of females, the increase in survival rates of youngstock and reduction in the average life span of adult animals would result in a positive rate of growth in adult category if the youngstock surviving is sufficient to meet both the replacement and the additional demands for the adult females. An analysis of the trend in the female young and adult-stock cattle in the last two decades showed significant increase in their population. The survival rate of young-stock males has been, on the other hand, declining and the average life span of adult males has fallen, indicating a negative rate of growth in their population. This is consistent with the observed trends in male young and adult stock cattle population (see Table 5).

More insight into the effect of the survival rates of male and female population on their size and composition can be obtained by examining the trend in the sex ratios in different age groups. Analysis of the trend in the sex ratio of cattle and buffalo populations in the last two decades showed the following: (a) the sex ratio of cattle in the age group (0-1) declined slightly in the fifties, but it has been on the increase from the sixties; (b) the sex ratio of youngstock and adultstock cattle has been declining throughout the last two decades. In the case of buffaloes the sex ratio has been declining over all the age groups.

What do the trend in survival rate as well as the change in size and sex ratio of cattle population indicate? The rise in survival rate of youngstock females, the reduction in the average life span of the adultstock and the increase in the size of the population clearly show that the incidence of slaughter has not affected the growth of the population. In fact, it only shows the culling of the adult female at a slightly lower age than before and replacing the off-take from the adult female stock by an increase in the

survival rate of youngstock female. The incidence of slaughter on the adult female is seen to be felt at the age beyond which the productivity of animals begins to fall.[21] The foregoing discussion shows that the existence of an adjustment mechanism of selective slaughter has really helped to weed out the low-productive and unproductive females and to fill their place by healthy and more productive stock. This process has given a wider choice for selecting the youngstock best suited to reach adulthood and resulted in maximisation of both meat and milk production. In the case of male cattle, the incidence of slaughter has resulted in reduction in not only the average life span of adultstock but also the survival rate of youngstock as well as the total adult stock population. However, the rise in the number of male animals slaughtered, has resulted in better feeding and management of the male calves and in their survival rates to the higher age group (1 to 3 years). But once they reach the youngstock age group they are culled for meat. Thus the existence of slaughter of male animals has resulted in reduction of wastage of young male calves due to malnutrition and diseases and has contributed to the rise in meat output. It is also to be mentioned that the trend in the sex ratio of cattle also indicates systematic incidence of slaughter of males in the higher age groups.

Ban on Slaughter

What will happen if cattle slaughter is banned in the state? In order to be able to offer an answer, we have to examine the likely impact of such a ban on the (a) size and quality of the cattle stock, (b) livestock economy of other states, and (c) different segments of the population in the state.

A ban on cow slaughter will result obviously in a rise in the size of the young and adult stock. This is mainly because, in the absence of a mechanism for the elimination of unproductive animals, they will be weeded out only by natural death. Since the state is already very poor in the production of livestock feeds, a rise in the size of the stock will result in a decline in the productivity of animals as a result of deterioration in the level of feeding. Besides this, the survival of unproductive female cows and under-fed youngstock will result in the multiplication of the number of unproductive animals in the state. In other words, this implies that all the attempts made so far for improving the genetic potential of animals through upgrading and cross-breeding and the favourable impact they have had on the livestock economy of the state will be negated. What remains at the end will be large hordes of ill-fed, unhealthy and unproductive bovine population.

As we have discussed elsewhere, Kerala has an open livestock economy with larg-scale migration of bovines into the state from neighbouring Tamil Nadu.[22] Available evidence on the migration of bovines into Kerala has showed rapid rise in the rate of migration in the last one decade. In 1976-77 about 6 lakhs bovines were imported from Tamil Nadu; out of this 22 per cent was draft animals, nearly 25 per cent milch animals and the rest slaughter animals.[23] About 60 per cent of the bovines imported were cattle and the rest buffaloes. Studies on the movement of imported animals in the state have shown that about half these animal herds moved to the farm and rest to the slaughter houses. The flow of animals a decade ago was only about 3 lakhs and the near-doubling of the import of animals is obviously due to growth in demand for slaughter animals and for replacement of draft and milch animals, especially buffaloes. So far there is no evidence to suggest that this inflow had adversely affected the livestock sector of Tamil Nadu. On the other hand, it might have only helped Tamil Nadu in disposing of its surplus animal stock, thereby reducing the pressure of animals on land. Besides all this, the hides and skins from the slaughtered animals are exported to Tamil Nadu for catering to its demand for leather and leather-based industries. Thus Tamil Nadu exports its surplus animals to Kerala and Kerala supplies raw hides and skins to Tamil Nadu and in this process both the states benefit. A ban on cow slaughter in Kerala or a ban on the export of animals from Tamil Nadu will adversely affect the livestock economy of both the states, besides upsetting the existence of a wide range of industries in Tamil Nadu.

Again a ban on cow slaughter will adversely affect the relatively poor segments of the population more than the rich.[24] Given the prevailing pattern of ownership and distribution of milch animals in Kerala, it is the poor sections of the rural households operating farms below 1 acre in size which are the core of the milk producing sector. They own about 80 per cent of the milch animals and contribute to more than 75 per cent of the marketed surplus of milk. Hence the efforts to intensify milk production activities in the state will help the poor more than the rich. But the retardation of these efforts by introducing a ban on cow slaughter will result in defeating the ongoing cattle development projects and hence will affect the poor.

Table A: Estimated Death Rate of Cattle in Kerala

Year	Cattle	Buffalo	Total Bovine
1961	21.0	23.0	21.5
1966	23.0	25.4	22.9
1972	27.6	33.7	28.4
1977	28.7	34.5	30.4

Note : Bovine mortality rates are given in percentage of animals died to total bovine population.

Traditionally beef is consumed by Christians, Muslims, backward castes among Hindus and the scheduled caste and scheduled tribe population in the state. Also in this state there have been no religious or cultural taboos attached to the slaughter of cows. With the rise in the cost of protein from fish and other sources and the relative cheapness of beef, caste attachments to consumption of beef have disappeared. Today beef is consumed by a good proportion of the non-vegetarian population, irrespective of caste or community, who cannot afford more costly varieties of fish or mutton or poultry meat. Thus the ban on cow slaughter will result in denying the small amounts of animal protein consumed at present by the relatively weaker sections of the non-vegetarian population in the state.

Conclusion

Cattle slaughter in Kerala has resulted in the raising of both meat and milk output. A ban on slaughter of cattle, especially cows, will adversely affect the ongoing livestock development projects and the weaker sections of the population. Why is it then that the saint of Pounar and his followers are agitating for a total legal ban on cow slaughter in Kerala? It is worth remembering in this context that there had been an agitation, decades ago, for a ban on cow slaughter in Travancore based on economic reasoning.[25] In the early part of this century, there had been considerable rise in milk prices in Travancore caused by the rapid growth in demand for milk following rapid rates of growth in human population. In those days, the supply of milk did not respond to demand. Some people attributed this failure to the indiscriminate slaughter of milch animals and hence pleaded for a ban on

TABLE B: ESTIMATED NUMBER OF CALVES BORN (LAKH) AND CALF MORTALITY RATES FOR CATTLE AND BUFFALOES IN KERALA

Year	Estimated Number of Calves Born (lakhs)		Calf Mortality Rates (per cent)	
	Cattle	Buffalo	Cattle	Buffalo
1961	5.68	0.53	8.0	22.0
1966	6.62	0.56	15.1	19.0
1972	7.78	0.75	16.5	35.0
1977	8.12	0.82	10.1	32.2

Note. Calf mortality rate is expressed as percentage of calves died to total number of calves born.

TABLE C: TREND IN SURVIVAL RATE OF YOUNGSTOCK

Year	Number of Deaths of Youngstock (lakhs)				Survival Rate			
	Cattle		Buffalo		Cattle		Buffalo	
	Male	Female	Male	Female	Male	Female	Male	Female
1961	1.9	1.5	0.13	0.07	48	44	55.0	69.0
1966	1.8	1.7	0.07	0.08	47	43	78.0	70.0
1972	1.9	2.0	0.12	0.14	41	54	64.0	65.0
1977	2.4	1.8	0.14	0.18	32	58	66.0	67.0

cow slaughter. But strong counter-arguments also came up. The issue was debated intensively in the press, the platform as well as in the Travancore Legislature Council. A resolution on 'prohibition of cow slaughter' was moved in the assembly in November 1923, but was withdrawn in the face of fierce opposition from the majority of the members.[26] The objective and informed manner in which the issue was discussed is evident from the following extract from the speech of one of the members of the Assembly:[27]

> People who know the habits and customs of the country are very well aware that milch cows are not at all slaughtered. It is only the barren cows that are being slaughtered and cows slaughtered form only a microscopic minority of the total number of cows in existence. The slaughter of these cows cannot at all account for the scarcity of milk. It is more due to the unscientific way of rearing cows and the indifferent feeding arrangements in vougue.
>
> Again it is economically unsound to kill a milch cow. A milch cow may fetch anything between Rs 20 and Rs 150; a butcher will not at all find it worthwhile to buy and slaughter a milch cow on such a high price. That being the case, it is not at all reasonable for us to argue that milch cows are being slaughtered in any large number. The slaughter of cows, I am positive, is not of the reasons for the scarcity of milk in the country... I have often thought that it would be more merciful to slaughter some of the old cows which have long passed their period of service. Owing to sentimental consideration I find that people are not at all prepared to sell them to butchers. In such cases persons like Hooge Worf have their pension for maintaining such cows. There are other people who have not even a pension to fall back upon.

Even today the above arguments are valid. It is a pity that many of the present-day politicians and Acharyas are not prepared to look into the plain facts relating to the working of our agrarian sector; instead they are busy setting trends of anti-development in the name of development.

Appendix

Estimates of mortality rates of cattle and buffaloes are arrived at by using the following method.

(1) *Overall rates of bovine mortality*

If bopo is the bovine population reported by the Livestock Census in the year bo and if C1 and I are the number of animals added to the population bopo within the year bo+1 by births and imports, respectively, then the expected population (E1) at the end of the year bo + 1 will be (bo po +1+11), if there are no deaths of animals in the year bo+1. Let A1 be the actual population at the end of the year bo+1, as obtained by the interpolation of the Census data, then the estimated number of deaths of animals in the state will be given by (E1 — A1). The approximate number of births of cows and she-buffaloes each year will be given by the number of male or female calves or the number of cows/she-buffaloes in milk whichever is the highest. Data pertaining to the import of animals have been obtained from the Renderpest Eradication Unit of the Animal Husbandary Department. The estimated death rates of cattle and buffaloes are given in Table A.

(2) *Calf mortality*

Calf mortality rates are estimated by subtracting the number of calves surviving at the end of a year from the number of calves born. The results are given in Table B.

(3) *Youngstock mortality*

The youngstock mortality rates are obtained by using the following formula: $R = r\ (1 + g)$ where R is the survival rate of youngstock cattle and g is the growth rate of the calf population. The formula is obtained by using the following assumptions: (a) the annual number of births remain unchanged in consecutive years, (b) the annual survival rate for the youngstock remains the same in consecutive years, and (c) there is migration of cattle into Kerala from other states, but no cattle movement takes place from the state to outside the state. Under these assumptions, if x is the size of the (0-1) population and y the size of the (1-3) population and 1/b is the (1-3) population migrated to the state, then $x_1r + x_2r^2 = y\text{-}y$, where r is the survival rate of (1-3) population. But the number of births in consecutive years may or may not be equal and hence the value of r will be different for different years. The new survival rate R for different years will be given by $R = r(1 + g)$.

Notes

1 This has been publicly stated several times by the Chief Ministers of Kerala and West Bengal in their press conferences. Besides, in a written reply given in the State Legislature, the Chief Minister of Kerala expressed clearly the inability of his government to impose a ban on cow slaughter in the state. The Communist Party of India (Marxist) which is the major partner in the West Bengal Ministry, in its last Party Plenum passed a resolution opposing legal ban on cow slaughter in these states.

2 Recently a team of the Gandhi Peace Foundation headed by R R Divakar toured different parts of the state trying to mobilise public opinion. But it received a very cold reception in all the places.

It also submitted a memorandum to the Chief Minister.

3 In the last few months, almost every day innumerable number of smal write ups (especially in the letters to editor columns) articles, etc, have appeared in most of the local newspapers reflecting public sentiment. Some newspapers even wrote editorials; others published special issues debating the problem, the general opinion expressed in these writings being that the agitation of the Acharya for a legal ban on cow slaughter is ridiculous. A bibliography of these writings is available with the author of this article.

4 There are different theories on the origin and evolution of the sacred cow concept in India. There are also two competing schools of thought on the influence that the Hindu religion has had on the maintenance of a large stock of cattle population in the country. These issues are being debated intensively both in India and abroad. It is a pity that in a country where the state is incapable of protecting millions of poor people and cannot provide them minimum subsistence, the protection of the cow has become a constitutional burden on the people and the state. For an excellent summary of the issues relating to the origin of the sacred cow, see Fedric J Simoons, "Questions in the Sacred Cow Controversy", *Current Anthropology*, Vol 20, No 3, September 1978.

5 Data pertaining to the number of animals slaughtered in the licensed slaughter houses in the state are collected by the statistical unit of the Animal Husbandry Department. The monthly data on slaughter are published regularly in the *Bulletin of Animal Husbandry Statistics*.

6 According to the existing laws on slaughter of animals in Kerala, the butchering of productive animals and young calves is legally prohibited. The definition of productive animal includes bullocks suitable for traction, cows in milk and dry cows which are likely to become reproductive with proper breeding. The slaughter of both male and female calves is prohibited. But the fact remains that all slaughter of old bullocks and cows and young male stock do not enter the official slaughter statistics.

7 See for details, Institute of Agricultural Research Statisitics (ICAR) "Estimation of Milk Production and Other Bovine and Goat Practices in Kerala", New Delhi (undated).

8 The findings of this survey are reported in the author's PhD dissertation "Livestock Holdings in Kerala — An Analysis of Factors Governing Demand and Supply" being submitted to the University of Kerala.

9 See, Central Leather Research Institute, Report of a Survey on Leather and Leather-based Industries in Kerala, Madras, 1976.

10 *Ibid*, p 12.

11 The average yield of meat from a standard animal is, as per the CSO estimate, about 102 kg for cattle and 156 kg for buffalo. Since the standard animal is expressed in adult units, we converted the number of deaths in youngstock into their adult stock equivalent units by assuming one youngstock to be equal to half the adultstock. The outturn of meat from other livestock sources is taken from the official estimates on the outturn of meat in the state.

12 The official estimates of bovine meat output suffers from the following limitations: (a) they assume constant mortality rates for animals over time which is not true, and (b) the imported component of the animal stock is seen to be usually underestimated for the purpose of estimating meat output. These limitations have resulted in a considerable degree of underestimation of the quantum of meat output.

13 See Nair, N K, "Milk Production in Kerala: An Analysis of Past Trend and Future Prospects", *Economic and Political Weekly*, Review of Agriculture, March 1979.

14 For a detailed discussion of the growth in demand for and supply of fish in Kerala, see John Kurien, "Towards An Understanding of the Fish Economy of Kerala State: A Preliminary Study of the Current Situation and Trends in Organisation, Technology, Production and Distribution of Incomes", Working Paper No 62, Centre for Development Studies, Trivandrum 1978.

15 According to the latest Livestock Census (1977) out of the 14 lakh milch cows in Kerala about 60 per cent belonged to the improved breeds and the rest to the desi breeds. The cross-bred population, as per our estimates, comes to about 1.5 lakh. The improvement in genetic potential of cows in Kerala has been a major factor for the significant rise in milk production.

16 The productivity of cows in terms of milk has increased by 80 per cent within the past one and a half decades. See for details, Nair, N K, "Milk Production in Kerala", *op cit*.

17 See for details, Nair, N K, "Size and Utilisation of Draft Animals in Kerala", *Indian Journal of Agricultural Economics*, No 3, October-December 1977.

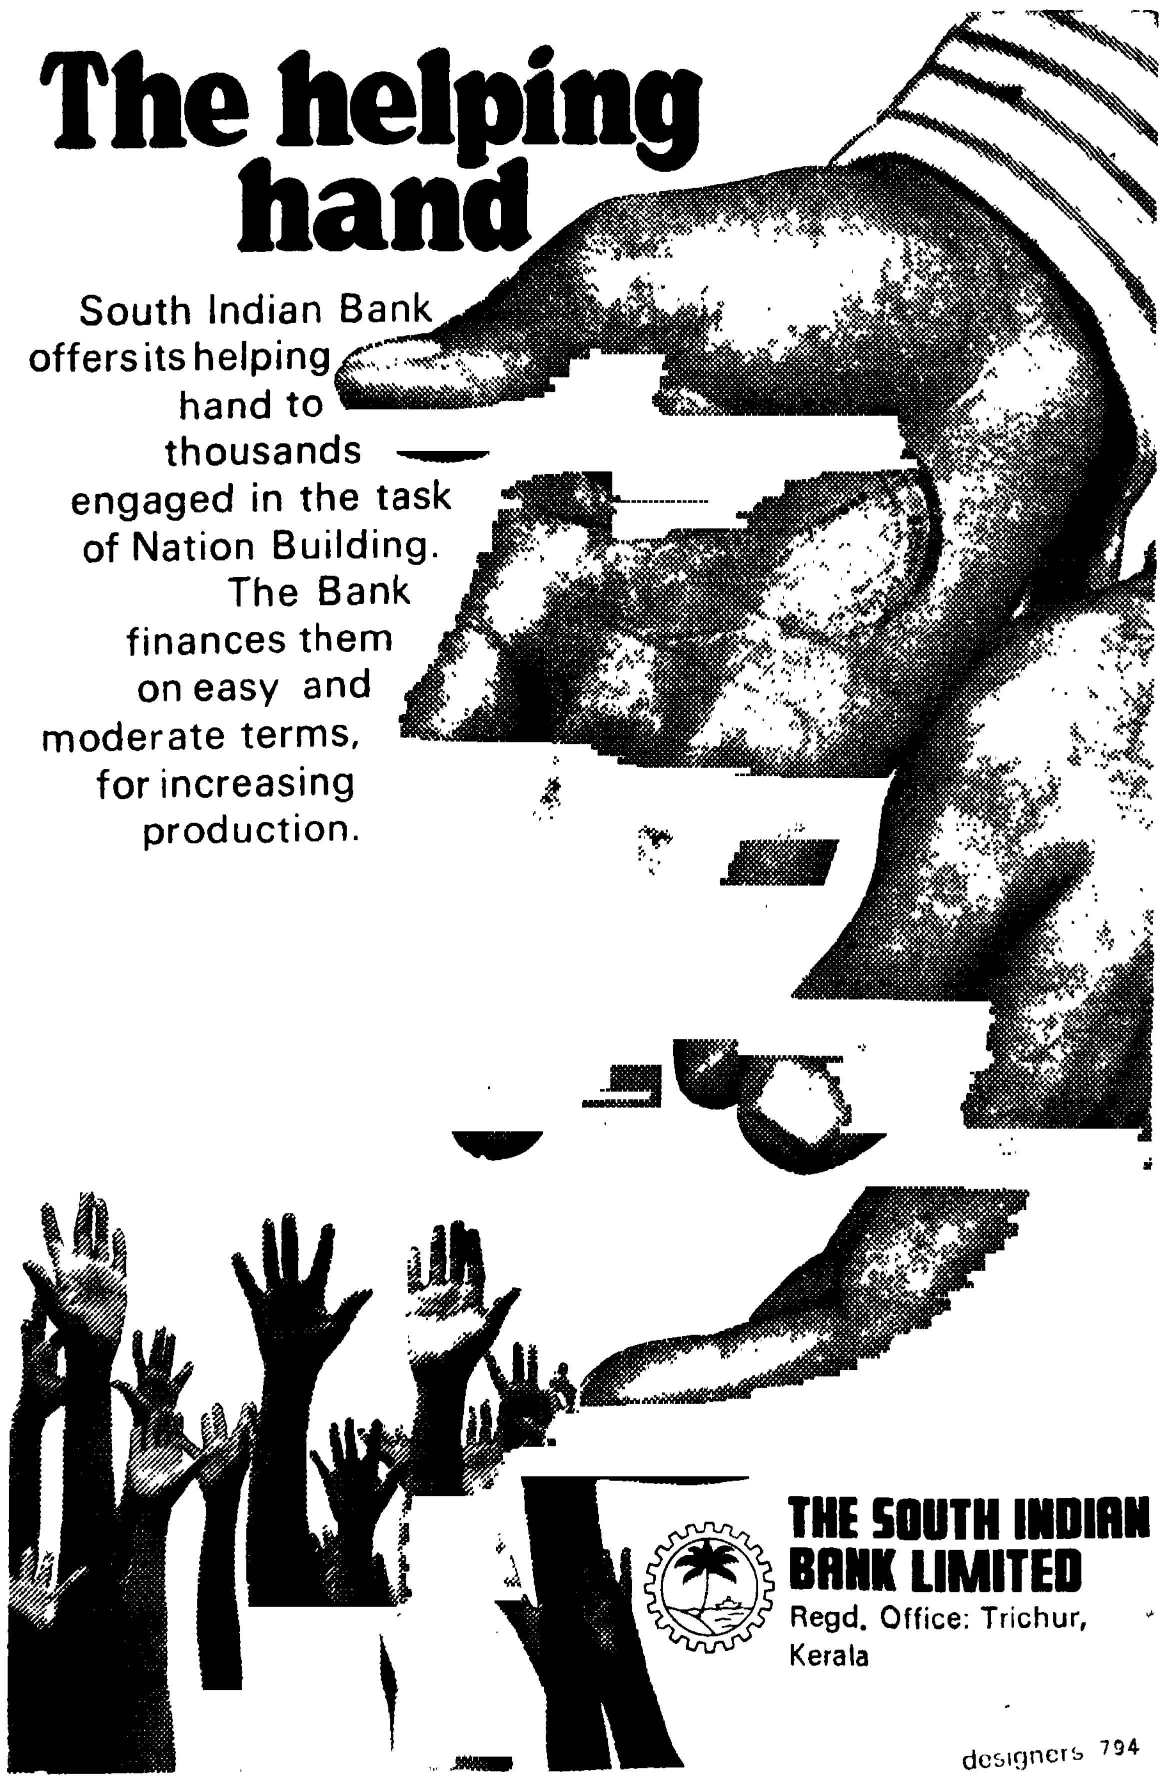
18 The only official source of statistics on bovine mortality in Kerala is the IARS survey mentioned earlier. This survey, conducted in the mid-sixties, gives a mortality rate of 5 per cent for cattle and 7 per cent for buffaloes. These data obtained from the sample survey have, however, serious limitations. In Kerala the livestock trade is a well organised business involving large number of markets scattered over all the regions in the state. A good proportion of animals brought to these markets are sent to the slaughter houses located in urban and semi-urban areas and the sample survey technique may not capture the mortality rate of animals due to slaughter taking place in such slaughter houses. Again, only rarely are animals butchered in individual households. The slaughter and distribution of meat in villages is usually done by professional butchers and the animals slaughtered by them would not enter into the figures reported in the sample survey.

19 See "Export Potential of India's Leather and Leather Goods Industries", Central Leather Research Institute and Gokhale Institute of Economics and Politics, 1964.

20 The single-year age-distribution data for the mid-sixties are obtained from the post-Census sample survey on Livestock Numbers. The corresponding data for the mid-seventies are taken from the 30th round of the National Sample Survey. I am grateful to the State Bureau of Economics and Statistics for supplying these unpublished data.

21 Analysis of the relation between age and yield rates of milch animals gives a curvilinear relation between the two variables. There is also significant concentration of milch animals in the first half of the curve which indicates systematic culling of the stock once their productivity begins to decline.

22 This aspect of the livestock economy of Kerala is discussed by the author in detail in an unpublished paper, "Livestock Trade in Kerala: An Analysis with Special Reference to Inter-State Cattle Trade", Centre for Development Studies, Trivandrum.



23 Monthly data on the import of animals are collected by the Animal Husbandry Department and published regularly in the *Bulletin of Animal Husbandry Statistics*.

24 See for details, Nair, N K, "Milk Production in Kerala", *op cit*.

25 See *Travancore Legislative Council Proceedings*, Vol IV, pp 154ff.

26 The resolution was moved by A Govind Menon. The extract quoted in this paper is from the speech by Mammen Mapilla in the Council opposing the motion.

LAND REFORMS IN KARNATAKA

KAMPUCHEA: CORRECTING THE RECORD

he future belongs to those who seek it

Photograph courtesy · Agfa-Gevaert Photo Library

Whether you seek it or not, the future arrives.
But you have a choice—to make it yours.

We have chosen a future based on better technology, better products, better investments and better management—and an enduring process of change!

To most housewives in India, Hindustan Lever is the supplier of well-known products—Sunlight, Dalda, Lux, Lifebuoy and a host of others. But this company has grown and changed especially in the last five years—so much, that we thought we should tell you something about it.

Do you know that about 60% of our total investments in fixed assets today are in projects in the core sector or sophisticated technology? That we have an investment of nearly Rs. 3 crores and a recurring expenditure of about Rs. 1.5 crores per annum in the largest private sector R & D Centre in India? That over 50% of all our managers are scientists and technologists?

A company goes the way its capital is invested and its management chooses the direction. Our direction is clear: technology-intensive sectors of national priority.

Down the Drain

NEW DELHI

IN his statement in the Lok Sabha on Thursday on the import policy for 1979-80, the Minister of Commerce, Mohan Dharia, claimed that it had been the government's endeavour to "impart greater stability to our foreign trade policy" and that, with that objective in view, the essential structure of import policy had been retained intact for the current year. In fact, this stability has been made possible not because of the government's foreign trade policies but actually despite them.

For the second year in succession the country's export performance was poor in 1978-79. Exports had gone up by only 4.5 per cent in 1977-78 and in the first 10 months of 1978-79 the rise was even smaller, only 1.9 per cent over the corresponding period of the previous year. Imports, on the other hand, rose steeply by 19.6 per cent in 1977-78 and further by as much as 23.8 per cent in the first 10 months of 1978-79. As a result, there was a trade deficit of Rs 692 crores in 1977-78, which widened to just over Rs 1,000 crores in the first 10 months of 1978-79. And the Minister of State for Commerce has just informed Parliament that the government expects an even larger trade gap this year.

Normally, trade deficits of this order would have compelled the government to forget its commitment to stable foreign trade policies and willy-nilly take steps to restrain the growth of imports. If, for the present, the government has been able to escape this predicament and continue its liberal import policies for another year, it is only because of the fruits of the labour of the many thousands of Indian workers abroad, most of them engaged in arduous work in conditions of very considerable regimentation and privation in the countries of West Asia. The remittances from them have ensured that despite the large trade deficits, the country's foreign exchange reserves (exclusive of transactions with the IMF) went up by Rs 1,885 crores in 1977-78 and further by Rs 794 crores in the first 10 months of 1978-79.

Apart from stability, the other virtues claimed for the import policy are its contributions to expansion of exports and to the growth of investment and production. Exporters continue to receive most favoured treatment. The scheme for grant of advance licences with duty exemption for import of raw materials and components for export production has been further liberalised. And with the import requirements of production for export so readily available, the so-called import replenishment licences, which are now freely transferable, have become a straightforward arrangement for permitting import of items on the restricted and banned lists to be disposed of at a premium in the domestic market as a further source of profit for exporters. Despite these measures, and the cash subsidy payments which have more than quadrupled from Rs 88 crores in 1974-75 to Rs 381 crores in 1978-79, the actual trend of exports in the last two years are not the best advertisement of the success of the government's export promotion efforts.

The government has sought to explain the relative stagnation of exports in terms of special factors like the recessionary conditions in the world economy, fall in international prices of important Indian export items, power shortage, transport bottlenecks, disturbed industrial relations, etc. None of these explanations is particularly convincing. For instance, the credibility of the world recession argument is called into question by the fact that in the first six months of 1978-79, while exports to America and West Europe were maintained at the previous year's level, it was in exports to the East European countries, which cannot be said to have been affected by the recession in the capitalist industrialised countries, that there was a sharp fall of Rs 169 crores (34 per cent). In fact, the argument can be reversed and it can be maintained that it is the seemingly sharp rise in exports between 1972-73 and 1976-77 which had been helped by exogenous circumstances and that if allowance is made for developments such as the fortuitous rise in sugar exports, the increase in the rupee value of exports due to depreciation of the rupee and the rise in the value of the Indian exports because of the world-wide inflation, the annual rates of growth of exports during this period turn out to have been within the modest range of 3 per cent and 10 per cent.

The contribution of liberal imports to higher domestic production and investment is equally unclear. The broad composition of imports suggests that much of the sharp rise has occurred in maintenance imports to make up for shortfall in domestic production of items like cotton, edible oils, fertilisers, petroleum products, steel, paper, etc. The machinery and transport equipment group did show modest increases of 7 per cent in 1977-78 and 13 per

was accounted for by transport equipment. The Economic Survey, 1978-79, claims that the criticism of the government on the score of "non-utilisation of the country's growing foreign exchange reserves for development" is no longer valid since imports had gone up very sharply in the last two years. While imports have undoubtedly risen, the actual trend of investment in the public and private sectors does not suggest that investment has benefited from the ready availability of imports.

Mizoram

Back to Square One

THE results of the elections for the Mizoram Assembly should be wholly gratifying to Brigadier Sailo, whose party, People's Conference (A), has been returned to power. The results should also be gratifying to the Central government which had gone out of its way to accommodate Brigadier Sailo during the crisis that overtook his government in October-November last by dissolving the Mizoram Assembly even though elements opposed to Brigadier Sailo were in a majority in the Assembly and were prepared to demonstrate their strength on the floor of the House.

The reasons for the Centre's apparent partiality for Brigadier Sailo are not difficult to gauge. In the brief period when Brigadier Sailo was in power, some more progress was made in the continuing task for further splitting and demoralising the insurgent elements among the Mizos and, for a while, it even looked as if the task of finally taking over the political leadership of the insurgency would be achieved under the improbable leadership of Brigadier Sailo himself. The setting up of a rival to the rebel leader Laldenga in the Mizo National Front, the apparent ouster of Laldenga from the post of the president of the MNF, as well as the studied disapproval of attempts by elements within the People's Conference to bring together the warring factions in the MNF — all these can be attributed to Brigadier Sailo's own anxiety to ensure for himself the leadership of not merely the leading parliamentary group in Mizoram but also, even if indirectly, of an important segment of the Mizo insurgent movement.

That attempt, it is needless to add, was foredoomed to failure; even the government of India, with all the resources at its command, has signally failed to contain Laldenga, much less eliminate him from the position of leadership of the Mizo insurgents. Indeed, during the period between the dissolution of the Mizoram Assembly and the elections last week, such efforts were intensified and a most incredibly twisted succession of coups and countercoups were reported in the MNF outfit, each change being interpreted in intelligence handouts dutifully reported as 'news' by the news-agencies, an yet another 'setback' to the leadership of Laldenga, still involuntarily enjoying the Government of India's hospitality in distant Delhi. But at the end of it all it has now transpired that Laldenga after all is very much in command, albeit by proxy, of the leadership of the MNF. The ousting of Laldenga by Biakchhungnunga in July 1978, the latter's own ouster three months later in October, the further convulsions in the MNF top leadership in January this year — all these have not in the least affected the basic reality of the continued relevance of Laldenga in any settlement of the Mizo problem.

The return of Brigadier Sailo to power in Aizawl, and the defeat of most of the 'dissident' People's Conference (B) members in the recent elections might induce the authorities in Aizawl and Delhi to persuade themselves that the present elections have once and for all settled the question of who enjoys the most extensive popular support in Mizoram. But the problem in Mizoram is not merely one of testing through an election conducted under the aegis of the Government of India as to who enjoys the maximum support among the Mizos. It is one thing to win an election; but an entirely different outcome might have been possible had the issue before the people been confined not merely as to who would be in charge of disbursing the large Central subsidies in Mizoram, but had also included larger political questions, like the one concerning Mizo nationhood, and the problem of incorporating the various insurgent elements in a larger political settlement. The kind of crisis that overtook the Sailo government so soon after it assumed office last time might once again overtake the present set-up if Brigadier Sailo continues to believe that he, and only he, can be the most effective intermediary between the insurgents and the Government of India; or if he persists in fresh attempts to encourage factions loyal to him in the insurgent set up.

An interesting feature of the present elections in Mizoram has been the arrival of a more or less authentic Janata presence in the Union territory. In the last elections, the local unit of the Janata party had unsuccessfully fought the elections without any sanction of the Central unit of the party and indeed, against the advice that it [illegible]. In the present [illegible] important Janata leaders from the Centre and from Assam actively campaigned for Janata candidates and the party has been able to win two seats. It is yet to be seen whether this entry of the Janata party into Mizoram politics has been merely the result of 'friendly opposition' to the People's Conference whose leader continues to enjoy excellent relations with the Central leadership of the Janata party, or whether it is yet another manifestation of the curious form of 'internal democracy' that exists in the Janata, or more probably, whether it is an indication that the Central leadership has belatedly woken up to the fact that it would not do for it to identify itself much too closely with the present dominant faction of the People's Conference and is preparing for future alternative arrangements.

Cement

Catching Up with Market

NOBODY, least of all the industry itself, would be naive enough to believe that the recent generous increase in cement prices is going to lead to the long promised adequacy of cement production. That 'remunerative prices' beget increased production is a myth about the market mechanism. Indeed, it is perpetuated by those who know only too well that aggregate profit maximisation is often fostered, under the imperfect conditions endemic in the real world markets, by a certain optimal shortage of supply. And such merchant profits are maximised when industry through trial and error works out what is that necessary shortage.

Only last month it was made out that the government would not announce its decision on the Lav Raj Committee report till June. But in the very first week of this month it has announced increases in the controlled price of cement which have ostensibly made even industry express satisfaction, for the first time in a long while. It is not merely the large increase in price but the reversal of the uniform retention price and return to the erstwhile three-tier system, varying according to the cost structure of the cement units. From Rs 168.82 per tonne, the retention price has been pegged up to Rs 185, Rs 205 and Rs 220 per tonne. Moreover, the basis for calculating the price is to be a 12 per cent return (net of tax) on net worth as against a 14 per cent return on capital employed. It should be recalled that the substantive acceptance of the Lav Raj Committee recommendations is in line with the industry's own earlier ap-

[illegible]

But [illegible] understood [illegible] the enhanced price is still short of the open or 'black' market price which, with current supply more than 10 per cent short of demand, has been unconscionably high. The final smaller consumers will thus continue to pay the ruling black market prices which cannot be significantly reduced since — even granting the myth of high price elasticity of supply — neither expansion nor higher production can be immediately effected.

In any case, new units have been subject to the '12 per cent returns on net worth' formula for calculating prices since September 1977. The much publicised 85 letters of intent and seven licences sanctioned for 15 mn tonnes capacity since then show little sign of being implemented to bridge the gap in supply — leave alone the 88 schemes approved for mini-cement units throughout the country. In fact, it is established practice by now that licences are pre-empted to pre-empt finance and to expand in a measured way so as to maximise profit (i e, not necessarily to increase production to meet demand).

Nor is the government really expecting much of a change by the present price increase — apart from bringing part of the price paid by consumers within its own tax orbit. For 1979-80 demand is projected at 24 mn tonnes, supply at 21 mn tonnes (presuming adequate inputs and wagon availabilities). And imports, at 2 mn tonnes, are planned to cover two-thirds of the projected shortage. In the circumstances, the final consumers of cement may expect little change in the price they have to pay to obtain cement.

Meanwhile, in yet another exercise in efficient physical resource allocation and operations research — of which the overall impact is insignificant given enormous misallocations in the black market beyond the control of government — the Industry Ministry is blaring its decision to allow only 'split-location' cement plants wherein the clinker is centrally produced at points of easy availability of resources and then transported to near the various markets for being calcined into cement. It may sound more professional as a proposal compared to the earlier ones of having only mini cement units and state trading in cement, but whom is the Industry Minister fooling?

Politics

Sparring in Congress (I)

THE focus of political calculations in Congress(I) seems to be shifting gradu[illegible] [illegible] the AICC(I) session in Delhi last month when, much to her discomfiture, Indira Gandhi was completely overshadowed by the Karnataka Chief Minister, whose arrivals and departures at the AICC session seem to have evoked more political speculation than the speeches of Indira Gandhi herself. The expansive dispensing of quite gratuitous certificates of good behaviour to her ("I know her mind. She is not interested bringing her son to the fore of the political arena.") should have scarcely been to the liking of Indira Gandhi. What should have been more infuriating was the lacing of affirmations of loyalty to Indira Gandhi's leadership with straightfaced revelations — though these are no great secret — that in the past few months, he has been constantly courted by many Janata leaders.

Again, on his return to Bangalore, Urs pointedly said that the protests against the constitution of special courts to try Emergency offences would have to be 'non-violent'. "Yes, we have a right to protest. But it must be through public meetings and things of that sort. No violence. If we indulge in violence, we shall be going against our own creed." But these words contrast sharply with the deliberate rioting indulged in on May 1 by the Congress(I) demonstrators headed by Sanjay Gandhi himself whose total disinterest in political activity of any kind was being once again affirmed by his mother only the previous day at a party workers' meeting in Sultanpur.

Clearly, both Indira Gandhi and Devaraj Urs have been indulging in a lot of sparring activity; and the active participation of Sanjay Gandhi in the demonstrations against the Special Courts was meant to serve notice on Devaraj Urs that his plea for confining such protests to "public meetings and things of that sort" was not going to be heeded. But it is unlikely that barring such useless gestures of defiance, that faction of the Congress(I) which seeks to identify the party totally with the personality of Indira Gandhi and her son can do much to actually control Urs, much less dislodge him. The frustration of the anti-Urs faction was evident in the many deals that were sought to be struck before the elections to the various offices of the CPP(I) executive where the anxiety of the pro-Indira Gandhi faction was to see that the candidate identified with Urs did not win and not so much to ensure that the candidate identified with opposition to Urs and loyalty to [illegible] the [illegible] CPP(I) in Lok Sabha was most strenuously avoided, and a compromise agreed upon, only with a view to ensuring that the candidate likely to win, and known to be close to Devaraj Urs, did not have a chance to demonstrate her support in the CPP(I); while the election to the same post in the CPP(I) in Lok Sabha was allowed to be gone through even though the unfortunate candidate who lost badly was known to be a longstanding opponent of Urs and who had indeed tendered the 'friendly' advice to Urs some time ago urging him to give up the chief ministership and seek election to Parliament in order to project the case for Karnataka at the national level more forcefully.

Devaraj Urs is indeed becoming the *great unknown quantity in Congress(I)*; and the measure of the perceived threat that he presents to Indira Gandhi might be gauged by the fact that during and since the AICC(I) session, Indira Gandhi has been relentlessly attacking the concept of a 'third force' emerging from out of the *various factions* of the Congress and the Janata — an idea whose main inspiration has been Devaraj Urs himself, and which is even now being sought to be given a more material shape in his scarcely veiled confabulations with sundry Janata and Congress leaders.

The Fourth Estate

A Mysterious Link

Nireekshak writes:

GOVERNMENT pressure on the Press was the subject of discussion at two forums in New Delhi recently. One of them was the Editors' Guild, a body of working editors, and the other was the All-India Newspaper Editors Conference which is an amorphous organisation encompassing proprietor-editors, managing editors, and non-editors. The general feeling at both the forums was that the government continued to be partisan and determined to control sources of information and influence. The AINEC's discussion threw up a specific controversy — over the link between the Press Trust of India and the Rome-based Inter Press Service, described as a newsagency of the non-aligned group.

The link is on an experimental basis for six months but the manner it was achieved was the real issue. It would appear that the PTI Board of Directors had said "no" to the government's sug-

[illegible] for such a link. But it had to say "yes" later after the government's representative on the board had threatened that the problem of payments to PTI by All India Radio and other government agencies would remain unresolved.

The PTI's initial objection to a link with the Inter Press was based on doubts about its credibility. However from what the PTI General Manager told the seminar by way of a defence of the *volte face* was that the government had made inquiries through its diplomatic representation in Rome and made sure that the credentials of Inter Press were sound.

The vulnerability of all the four Indian wire agencies (at one time forcibly merged into Samachar and after the Emergency restored to their old identities and relaunched with heavy governmental underwriting) to governmental pressures is no secret. The irony of it all is that the newspapers are sellers of these agency services — and buyers as well. The newspaper industry is not prepared to foot the bill of running viable, credible newsagencies and has had no compunction about accepting direct or indirect subsidies from the government.

The government of the Emergency days exploited this vulnerability (by cutting off UNI and PTI services for AIR for a few days, for instance) to secure the merger of the agencies into a single entity so that the government could say that India had a national agency and claim pride of place in the non-aligned newspool. The controversial Mohommed Yunus, one of Indira Gandhi's principal Emergency advisers (who surprisingly got away with everything and even the Shah Commission had nothing to say against him!) masterminded everything because he was sold on the non-aligned newspool idea and had visions of India as its *prima donna*.

The government that succeeded Indira Gandhi's saw no objection to continuing with the non-aligned newspool plan. All that happened was that Mohommed Yunus was replaced by another enthusiast, D R Mankekar. Mohommed Yunus was a member of the Samachar board and could represent India at the newspool parleys. But Mankekar, who is chairman of the non-aligned newsagencies' newspool, has nothing to do with any of the four agencies. He is a direct nominee of the government.

The charge that the PTI was pressured into entering a link with Inter Press cannot be dismissed out of hand. It might well be true given the government's fascination for the newspool idea. But the question is: are the newspapers subscribing to the PTI convinced of the agency's credibility even if it does not distribute the dubious Inter Press service? As India's premier newsagency in the pre-Samachar days, it had for all purposes been a public relations outfit for the government and those who resent the alleged pressure over the Inter Press link had no objection to the heavy subsidies it was getting from the government. And PTI's correspondents abroad angle their stories on the advice of the local Indian embassy. Newsagency correspondents are generally taken on VIP trips abroad as guests of the government. All this, it would seem, makes little difference to the credibility of the agency.

The Inter Press link is no doubt an unwanted financial burden on the PTI but a stepped up subsidy might solve the problem. The basic issue of PTI's own credibility and its dependence on non-newspaper revenues (even in the best of days when the luxury of Samachar had not been thought of) remains. Newspapers spend hardly one per cent of their gross revenue on collection of news (subscription to agencies and their own news services). They have got used to buying agency services cheap, thanks to concealed and open government subsidies. So arguments at forums like the AINEC on government pressures on the Press sound a little hollow. One would have appreciated all the arguments had the AINEC announced plans for, say, a co-operative newsagency the costs of running which would be shared equitably by the subscriber newspapers and the government would not be sold the service. The instance of one of the two United States wire services refusing to sell its service to the government-run Voice of America is there.

Nepal

Challenge to Autocracy

THE series of student demonstrations in Kathmandu and other cities in Nepal which have culminated in the police firing in Hataura and the officially admitted death toll of three have to be seen in the context of the developments over the last three months, specifically since the execution on February 9, 1979, more than two years after they were sentenced to death, of two leaders of the banned Nepali Congress Party. That execution itself had set off, according to a Reuters report, widespread student disturbances leading to classes being suspended in most colleges in the Kathmandu valley.

The discontent apparently continued [illegible] Nepali Congress [illegible], when he returned to Kathmandu on March 6, to be severely heckled and have his supporters physically assaulted at Kathmandu airport, should have added to popular discontent. Soon, Koirala himself, who had spoken in so glowing a fashion about the sweet reasonableness of King Birendra when he had met him in November just before going abroad once again for medical treatment, was ordered to confine his movements to Kathmandu valley.

That was a day before Zulfikar Ali Bhutto was hanged; and that execution in distant Rawalpindi seems to have provided just the needed impetus for the student protests which had already been so forcefully expressed over the execution of Yagya Bahadur Thapa and Bhim Narayan Shreshta to be resumed with renewed vigour. The passions evoked by the hanging of Bhutto were closely related to the passions generated by the earlier executions at home; the Bhutto hanging only provided a convenient cover for the renewal of those passions.

But the intensity of this opposition, as well as its organised expression must have surprised the authorities in Kathmandu. A strike lasting for over a fortnight leading to the closure of the premier university in the country, police lobbing tear-gas shells and making cane charges on students, demonstrators burning cars, attacking the police with stones and sticks, seizing of a gun from a security man, attempting to storm the Nepal Bank building in Hataura, arrests of hundreds of students and extensive injuries to both students and policemen, the reluctant acknowledgement by the authorities that "the involvement of political elements in the student strike cannot be ruled out" — surely, all these are symptoms of scarcely permissible activity in such an ordered Panchayat democracy as that of Nepal.

The demands of the striking students have been mainly for educational reforms, but in a polity like that of Nepal, even a demand for educational reforms becomes a political demand. It is perhaps premature to see in these sporadic outbursts of student unrest the beginnings of a real challenge to autocracy. But the authorities are anyway not treating the outburst lightly, though curiously, the harshest measures seem to have been directed against so loyal an opposition leader as B P Koirala himself who has now been put under house arrest under the public security act, accused, incredibly enough, of organising the violence in Hataura.

DVC and Flood Control

My article on the above subject (November 11, 1978) was in the nature of an answer to the very serious problem posed by Ashok Mitra: whether it was not necessary to do some serious rethinking on the efficacy of the DVC in controlling floods which was the main purpose for which it was proposed, especially so when, after the commissioning of the DVC, instead of the floods being controlled, they have not only increased in severity without any decrease in frequency, but have been causing enormous damage to the most industrial region of West Bengal, the Durgapur steel plant and its neighbourhood.

As I have already emphasised, a "multi-purpose dam" does not mean that one can get every benefit in equal measure, there needs to be an order of priority. R J Prasad (April 14) conveniently overooks this point and refers to the need to store water to a predetermined level to meet the demands of water supply for domestic and industrial use, irrigation, navigation and for generating hydel power, I might here make it clear that power system stability has nothing to do with hydel power; Prasad seems to be ignorant of this simple fact. There are any number of power grids in the world which are innocent of any hydel power Power system stability depends on an adequate provision for peak-lopping that responds with the minimum of delay; the only advantages of hydel power in this regard, despite its obvious disadvantages, are that it is the cheapest under special circumstances and is pollution-free. In fact, if there is a power crisis in the Eastern Region of India today, it is because of the belief, sedulously fostered, that hydro-power is something that one can get for nothing. When in 1918, the First Coalfields Committee recommended pit-head thermal power generation, the proposal was brushed aside on the ground that the entire requirements of the coalfields could be met from the Hundru Falls at Ranchi; and this falls is to this day of only a sight-seers' attraction after the monsoons! Again, in 1950, the Working Party on Coal Industry of the GOI made out that there would be such an abundance of hydro-power available when the dams of the DVC are Commissioned, that there was no need to go in for thermal power on a large scale in this area; and, the total hydro-power capacity of DVC today could be provided by two 210 MW power stations of BHEL make.

The simple fact to which Prasad has no explanation to offer is that the Durgapur barrage designed for the discharge of the maximum flood, the probability of whose occurrance according to the statistical estimates of the DVC planners would be once in a hundred years, was unable to do so twice during an interval of less than twenty years and that, the steel plant site was flooded on both occasions, the second time in a more disastrous measure, because the rate of inflow at the barrage was far greater than the rate at which it was designed to discharge this inflow of water, making it clear that the water was released at a far greater rate than that at which it could be discharged by Durgapur barrage from the Panchet and Maithon dams. This accelerated discharge exceeding the normal, even if it be to maintain the water level in the reservoir of the dam at the "predetermined level", can only be called "panicky"

Let me make my point clear with an illustration from the Boulder dam which is also a multipurpose dam, one of the largest of its kind in the world today. The capacity of Lake Meade impounded by it is 30 million acre-feet. Of this, the top 10 million is alloted to flood-control, the bottom 5 million for the storage of silt, and the middle 15 million is the "active" storage whose flow is regulated to suit irriggation and power-production: and elaborate provision is made to prevent silting. According to Prasad, guide-curves had been worked out years earlier and approved and adopted. How much of the storage provided for silting years ago in the fifties is now available and has this loss in storage due to silting been made good at the expense of the storage allotted for flood-control? By proper design, it is possible for the storage allotted for flood-control to be used effectively by drawing this water, as fast as the flood-waters flow in, into irrigation reservoirs through high-level canals, thus ensuring that Bihar's interests are not affected without having to expose Bengal to flood havoc.

Prasad refers to the 1978 flood as the highest since the inception of the DVC. Is this observation based on the maximum intensity of precipitation in the catchment area as recorded by the IMD, or is it based on the peak flow in the Damodar near Durgapur as measured by stream-gauging? If the former is the case, the DVC planners proceeded on the basis of incorrect or inadequate meteorological data in predicting the maximum flood; if the former is not the case and yet the flood this year is the maximum of all the years since the inception of the DVC, it could only be due to extensive denudation of the catchment area — the result of reckless open-cast mining and no-less-reckless deforestation of that area — leading to destructive run-off, flash floods and heavy silting of the reservoirs impounded by the dams. If that has happened, the time taken to fill the reservoir will be confined to the active storage and what has been allotted to flood control, necessitating release of this water as has been the case this year.

The flood-control problem of the Damodar and its tributaries is the Indian version of that of the Arno and its tributaries in Tuscany whose history has been traced from 800 BC to mid-twentieth century by Richard M Klein. When the Etruscans came to Tuscany about 800-600 BC, the Arno and its tributaries were fresh-water streams that were navigable throughout the year, the hills were completely forested, and abounded in animal life. By 1117 AD, however, when the Ponte Veechio, the only Bridge across the Arno, was swept in a flood, it was clear that the Tuscan hills were denuded, the Arno had become a seasonal stream, and the land was plagued by drought. From then on, it was a progressive denudation of the hills, destructive run-off and increasing intensity of floods that culminated in the most devastating of them all in mid-20th century when the city of Florence was its special victim. The Damodar too, so long as it was allowed to be the holy river of the Santhals, was navigable for the best part of the year, and was the means of transporting coal from Raniganj to Calcutta until the extension of the Railway in the early fifties. I wish someone narrated its history with the same attention to detail as was done by Klein for Arno from 1757 to the man-made disaster of 1978 for the edification of the DVC and the National Committee on Environment.

The Communal Savagery

Romesh Thapar

THERE can be no running away from the savagery that now characterises what we continue to describe as a communal riot or fracas. Long ago, it was Ahmedabad which shocked us. Then, recently, Aligarh. And, now, Jamshedpur. I would suggest that the three collisions need to be studied in co-ordination. Only then will be able to get out of the *cliche* of describing this or that procession and this or that stone-throwing as the cause of the unthinking slaughter and brutality.

It is absurd to try and present these terrible happenings in terms of simplistic and surface causes. Communal riots of a serious nature take place in areas where moods, tensions and atmosphere of an unhealthy kind have built up over many months. Almost inevitably the local toughs and roughs are mixed up in one way or another, particularly, if the current passion for mafia operations is evident and *incidents of harassment* and blackmail are a continuing feature of life. The obsessive involvement of police and politicians in the swaying fortunes of the mafias, on the strange notion that this activity constitutes social management, disrupt the already strained system of law and order.

If the people have no one to turn to, as is so often the case, and the structure of governance loses respect, the whole people tend to find their own limited and opportunist answers to their threatened security. They gang together, take on the insurance offered by the local goondas, and even begin gathering weaponry and explosives for the day when issues must be decided. The communal virus is vicious, particularly for those who live among frightened peoples. The police cannot be insulated. If they are refusing to obey orders and declining to fire on their co-religionists, it is clear that they are badly composed and very much a part of the communal tangle.

Any one who still thinks about tackling problems is confused and demoralised by what the stories of Ahmedabad, Aligarh and Jamshedpur throw up. We do not seem to have progressed very far since the fateful days of 1947. The voices rise in protest. The appropriate noises are made by the politicians. Scapegoats are sought to be found — and usually among the RSS extremists who, individually, rather than organisationally, appear to stoke the fires. But there is never any serious effort to get to the priorities which must be faced before we even begin to draw frameworks for amity among the communities.

Why is it that there is little response to the repeated demand from the enlightened to encourage minority recruitment to the police and the para-military and military formations. Surely, the security of a community begins with the presence in the local police kotwali of a member of that community. This does not require profound study, and yet the rotten *status quo* prevails over a large part of the country where minorities are consciously denied entry into the law and order system. Even a cursory study of the Bengal experience under the chief *ministership of Siddharth Shankar Ray* would be rewarding. Ray, despite his many strange gambits, did give the police force a more representative character — and with significant results.

Secularism can no longer be paraded as an activity which ensures a certain number of jobs for the elite members of the minorities. It is now seen for what it is — a calculated and careful manoeuvre to isolate the natural leaders of the minorities from their crisis-ridden communities. Over the years of freedom, it is possible to plot the pauperisation of these communities despite the high moralist tone of our prime ministers and chief ministers. And let there be no artificial drawing of Left and Right equations because the sad fact has to be admitted that no formation has done any solid work to break the hold of the communalists.

The generally vague and woolly attitude to the communal savagery which we are to witness these days is rooted in the ambivalence of government and its wishy-washy attitudes. No one believes that Delhi will descend with devastating precision on the causes and those who build criminal careers on them. Non-governance, the rise of the politician gangster, the decay of the institutions of secularism, and the dogged refusal of the old men who rule from Delhi to stir in any manner but the familiar, have taken a deadly toll of the fragile structures of modernism. A salvaging operation is still possible, but not at the dizzy heights of political rhetoric and invocation.

Imagine a government which would have the energy to carry out the following tasks in the interests of the security of all communities:

(1) Pass a special law which enables the local administration to lock up habitual criminals and put them to work. All kinds of civilised solutions are possible. The political will is needed.

(2) Open recruitment of minorities to the police, the para-military and military formations throughout the country. The objective should be to make the kotwali more "representative" of India.

(3) Establish mechanisms within the apparatus of the state to insulate the local administration from blatant political interfer*ence. This area has seen sharp* deterioration because of supine senior leadership which permits the pummelling of its young officers.

Here is a beginning. No elaborate commissions are required. These are matters which can be settled within the existing structure of administration. To help matters, it might be necessary to speed up the appointment of Ombudsmen at various levels to restore the morale of the administration. There is a heavy dragging of feet here. Lok Pal, where are you...?

Communal savagery cannot be tackled any other way. Even a look at Sheikh Abdullah's "paradise" convinces us that the Union Home Ministry needs to bring that old man to his senses. He rules as if the state were his private domain, and the recent carnage among his own co-religionists is viewed in the valley as his work. But, then that is another story...

April 28

Hurt by Price Fall

Hansavivek

GUJARAT STATE FERTILISERS COMPANY has suffered a setback in its performance on account of substantial price reduction in caprolactum and lower retention price for urea in spite of higher sales of caprolactum and fertilisers. Production of fertilisers was 5,00,482 tonnes, only marginally lower than previous year's 5,08,179 tonnes despite the unexpected failures in the ammonia and urea plants necessitating longer shutdowns. Production of ammonium sulphate and diammonium phosphate was the highest since the commissioning of the plants. Output of fertilisers would have been higher but for the strike by officers and go slow by workers. With planned commissioning of the debottlenecking of phosphoric acid plant and installation of new centrifuge in urea plant, the management expects higher production this year. Production of caprolactum at 13,841 tonnes was lower by 2,698 tonnes as compared to that of the previous year due to unexpected failure of piston rod in one of the two refrigeration compressors of the plant and mechanical failure in purification system. With the installation of a new vibrating conveyor, production during 1979 is expected to be better than in 1978. The directors say that the retention price fixed for GSFC urea was "highly inadequate". Government has granted increase only to the extent of cost increases arising out of official levies and increase in cost of items controlled by it. They hope that government will fix suitable retention price for the company for the pricing period beginning April 1 last. The company suffered "heavy losses' in caprolactum as it had to substantially reduce its price following heavy imports allowed by government in 1977-78. Total net sales declined from Rs 82.88 crores to Rs 77.87 crores and gross profit fell from Rs 30.29 crores to Rs 18.03 crores, reflecting drop in overall margins. Net profit was more than halved at Rs 4.90 crores (Rs 10.10 crores). The redeeming feature, however, is that dividend is maintained at 22 per cent and the entire amount has been provisionally determined by the income-tax authorities to be exempt from tax in the hands of shareholders under section 80-K of the Income-tax Act.

The company has applied to government for allowing it to establish additional fertiliser capacity based on Bombay High gas. Its application for expansion of the caprolactum facility is also being considered by government. Meanwhile, its other projects such as debottlenecking of phosphoric acid plant, purge gas recovery, nylon-6 and melamine are under various stages of execution. Government clearances have been obtained for import of equipment and materials for the nylon-6 project and foreign exchange requirements have also been tied up. The foreign process licensors have prepared basic engineering for the

melamine project. The contract for establishing 1,32,000 tonnes per annum sulphuric acid plant (with provision to manufacture 33,000 tonnes of 100 per cent sulphur dioxide and 36,300 tonnes of 23 per cent oleum within this capacity) has been concluded with Simon Carves. The project is expected to be completed in 1981. The project cost of Gujarat Narmada Valley Fertilisers Company, co-promoted by the company with government of Gujarat, has been revised upwards. GSFC will have to extend further financial assistance to the tune of Rs 6.5 crores. It has already invested Rs 13.5 crores in the equity of the new company.

MANGALORE CHEMICALS AND FERTILISERS has achieved a marked improvement in its working during 1978 with a maiden net profit of Rs 1.33 crores as against a net loss of Rs 8.86 crores for the previous year following increase in sales (including recoveries under retention price scheme) from Rs 21.17 crores to Rs 38.12 crores. With prior year adjustments, the surplus is increased to Rs 2.42 crores which has brought down the accumulated losses to Rs 19.93 crores. The company produced 1,38,503 tonnes of ammonia and 2,32,120 tonnes of urea as against 94,476 tonnes and 1,52,981 tonnes respectively, during the previous year. The output would have been still higher but for stoppage of plants on three different occasions during the first half of the year and deterioration in the condition of the synthesis catalyst during the last quarter of 1978. Production for the current year has been planned at 1,99,860 tonnes of ammonia and 2,85,000 tonnes of urea. Since the company will have a small surplus of ammonia over the needs of its captive urea plant, the company has applied to the Central government for issue of letters of intent for installing a nitric acid complex for manufacture of nitric acid, ammonium nitrate, sodium nitrate and sodium nitrite. It is also proposed to set up an ammonium bicarbonate plant. The nitrates are required for the manufacture of explosives and there is a growing demand for them from the mining industry. The company expects to sell the bulk of its production to suppliers of explosives to meet the growing needs of mining industry in Karnataka. The cost of the complex is estimated at Rs 10 crores. For ammonium bicarbonate, there is a growing market from bakeries, pharmaceutical and other industries as also for export. This plant can be erected and commissioned within 6 to 8 months and its cost is estimated at Rs 20 lakhs. The company is seeking permission to import ammonia to increase production of urea by about 30,000 tonnes from the existing urea plant in view of the surplus carbon dioxide gas which is available from the present ammonia plant. This proposal is expected to cost Rs 4 crores. The company has also submitted a proposal for the duplication of its ammonia and urea plants based on naphtha feed stock and fuel oil. Its application is under consideration of the government. The project is estimated to cost Rs 95 crores, which is cheaper than putting up a grassroot plant in a new location which would cost no less than Rs 125 crores and take at least 3½ years to complete.

CEAT TYRES OF INDIA has turned out good results with higher sales, margins and profits compared to the previous year. Dividend is stepped up 5 points to 15 per cent. The directors attribute the improvement in performance to the change in the product-mix and larger demand for nylon tyres. Costs of raw materials such as natural and synthetic rubber, carbon black, rubber chemicals, etc, increased and prices of products were raised. There was an acute shortage of natural rubber in Kerala, which was aggravated by export of rubber by STC based on totally inaccurate information about production and stocks of rubber on hand. Rubber available in Kottayam market at Rs 675 per quintal in early 1978 rose to Rs 1,290 per quintal in July 1978. The company's production of automotive tyres and tubes as also bicycle and rickshaw tyres increased marginally. Efforts are being made to remove bottlenecks in the Nasik plant so that it could reach the rated capacity. The company's exports fell from Rs 4.75 crores to Rs 3.45 crores, as prices fetched abroad became unremunerative. Expansion of the Bhandup plant for increasing production by additional 1.6 lakhs each of automotive tyres and tubes per annum is in progress. The management expected to increase production by about 55,000 units during the current year. Full expanded capacity is expected to be available during the next year. To meet part of the financial requirements of this projects, the company proposes to issue 1,11,000 (11 per cent) cumulative redeemable preference shares of Rs 100 each.

BELAPUR SUGAR has again shown a net loss of Rs 39 lakhs for 1977-78 as against Rs 48 lakhs in the previous year, even though the factory crushed 2,98,893 tonnes of sugarcane against 2,01,663 tonnes, and produced 33,110 tonnes of sugar against 19,650 tonnes — thus recording increases of 48.21 per cent and 68.50 per cent, respectively, over the previous year. Average recovery of sugar also increased from 9.76 per cent to 11.08 per cent. Net sales value was only marginally higher at Rs 4.09 crores (Rs 4.02 crores). The company has valued the stocks of sugar at the year-end taking the actual value of the stocks sold upto the end of January 1979 and the unsold stocks at the market rate prevailing as on that date. Steep decline in prices following decontrol of sugar from mid-August last thus brought about a substantial loss. The factory commenced crushing for the current season on October 17, 1978, and produced 1,56,900 bags of sugar as compared with 1,40,770 bags in the previous year. One important factor which is seriously effecting the current year's cash flow is that certain heavy cash liabilities pertaining to 1977-78 have to be met during the current year.

CYANAMID INDIA, originally incorporated in India in 1947 under the name 'Lederle Laboratories (India)', has been engaged in the manufacture of pharmaceutical and agricultural chemicals. It has planned substantial expansion in agro-chemicals. It is setting up a plant at an estimated cost of Rs 2 crores for manufacture of a variety of organophosphate for agricultural inputs. It has also planned manufacture of fine chemicals with a capital outlay of Rs 50 lakhs. Both these projects are intended to be flananced from self-generated funds. In compliance with the condition imposed by the Government of India, the two partners, American Cyanamid of the US and Atul Products of Ahmedabad have to offer for sale out of their shareholding 4,55,949 equity shares and 2,27,975 equity shares, respectively, of Rs 10 each. These shares will be offered at a premium of Rs 12 per share. Of these, 30,000 shares have been reserved for employees of the company and 6,53,924 shares will be offered to the general public under a prospectus. The company has to its credit a good past record of earnings. Its total issued share capital is Rs 4.56 crores which is backed by reserves of Rs 4.74 crores.

THE ECONOMY

Cocking a Snook at Credit Policy

(By a Special Correspondent)

EXPRESSING his concern at the high rate of expansion of money supply in the first half of the fiscal year 1978-79, the Reserve Bank Governor had told bankers in November 1978 that "the information given by banks as to why such rapid expansion occurred has not been adequate to provide any satisfactory rationale". He had pointed out that the high degree of liquidity in the banking system in the first half of 1978-79 had led banks "to adopt an attitude conducive to very liberal extension of credit, especially to the big borrowers". There was a further surge in bank credit and money supply on the eve of the busy season of 1978-79 and the Governor had emphasised to the banks that "the first imperative of monetary policy at present is to contain the credit expansion potential during the rest of the financial year". With this objective, two measures were taken — the prescription of an incremental credit-deposit ratio and raising of the statutory liquidity ratio. The statutory liquidity ratio was raised by one percentage point from 33 per cent to 34 per cent from December 1, 1978 and banks were told to "so plan their future expansion of non-food credit that the incremental gross credit (non-food)-deposit ratio for the period December 1 1978 to end-March 1979 would be well within 40 per cent". The Reserve Bank Governor had also prescribed some broad norms for restraining credit expansion: "Credit has to be necessarily relative to the output, economic activity, employment creation, and so on. Norms of inventory and of other rigours of credit discipline have to be effectively enforced and a careful watch has to be kept on the return flow of funds.... In this connection, I would like to stress, again, the need for banks to implement the norms set by the Tandon Committee."

The monetary and credit situation during 1978-79, for which we now have the full year's data, needs to be reviewed against the background of the above statements. During the year, money supply (M_1) expansion turned out to be Rs 3,330 crores, the highest ever and a neat Rs 1,000 crores higher than the expansion in 1977-78 (Rs 2,357 crores). Even the rate of expansion, at 18.2 per cent against 14.7 per cent in the previous year, was very close to the peak rate of 20.4 per cent reached in 1976-77. The same trend is observed if the wider concept of money stock, namely, M_3 (ie, M_1 plus time deposits with banks), is considered. M_3 recorded an expansion of Rs 6,730 crores (20.5 per cent), compared to Rs 5,300 crores (23.5 per cent) in 1976-77 and Rs 5,128 crores (18.5 per cent) in 1977-78. Monetary expansion continuously ranging between 15 per cent and 20 per cent would have been unthinkable even some years ago.

The pace of expansion of real economic activity — output, employment or investment — had certainly not been such as to justify this order of expansion of money supply and credit. Employment in the organised sector grew by 2.7 per cent in 1976-77 and 3.4 per cent in 1977-78 and is unlikely to have risen by anything more than 3 per cent in 1978-79. The number of job seekers on the live registers of employment exchanges has gone up from 9.33 million at the end of 1975 to 12.33 million in October 1978, while the addition to employment in the organised sector between March 1975 and March 1978 was just 1.77 million. On the savings and investment side, gross domestic capital formation increased from 20.5 per cent of gross domestic product at market prices in 1975-76 to 21.8 per cent in 1976-77, but declined to 21.3 per cent in 1977-78. It could be that the decline was due to "a substantial fall in inventories of food, steel and fertilisers in the public sector which had contributed to the significant increase in the gross domestic capital formation in 1976-77" ("Economic Survey", 1978-79, p 2). Allowing for changes in stocks, it can thus be said that the 1976-77 increase was because of stockpiling of commodities and in 1977-78 there was no increase in capital formation. And for 1978-79, the indicators are that at best the 1977-78 level of gross capital formation will have been maintained. Further, in all these years of unprecedented monetary expansion, investment has consistently lagged behind domestic saving by 1.5 percentage points in 1976-77, by 1.1 percentage points in 1977-78 and probably by 0.5 percentage point in 1978-79. A single percentage point lag in investment, such as in 1977-78, meant a loss of investment of nearly Rs 900 crores. And yet in just these three years as much as Rs 8,387 crores (63 per cent) of additional money supply and Rs 17,160 crores (76 per cent) of additional total monetary resources (money supply plus time deposits) were injected into the economy.

Growth of GNP in these years has been erratic. It was just 1.6 per cent in 1976-77, 7.2 per cent in 1977-78 and the expectations for 1978-79 are around 4 per cent. Agricultural production declined by 7 per cent in 1976-77 followed by an increase of 13.9 per cent in 1977-78. In 1978-79, the growth of agricultural production may be about 3.5 per cent. Industrial output had expanded by 9.5 per cent in 1976-79 and only 3.9 per cent in 1977-78. In 1978-79, industrial growth is unlikely to exceed 7.5 per cent. Taking the three years 1976-77 to 1978-79 together, whereas money supply (M_1) increased by 63 per cent and monetary resources (M_3) by 76 per cent, GNP in real terms rose by about 14 per cent, agricultural output by 9 per cent and industrial output by about 22 per cent. There has also taken place a decline in the share of developmental outlays in the government's total outlays and in that of capital formation in total outlays, whether in the government or in the private sector.

There are many disquieting aspects of the credit and monetary expansion in 1978-79. First, the contribution of 'currency with the public' to the expansion was the highest in recent years. Of the total increase of Rs 3,330 crores in money supply, as much as Rs 1,668 crores (or 47 per cent) was in the form of 'currency with the public'. The increase in currency in the previous year was of the order of Rs 755 crores (32 per cent of money supply expansion). Even in 1976-77 when currency expansion was very high at Rs 1,168 crores, the proportion had worked out to about 43 per cent. The expansion in currency implies that the Reserve Bank has actively aided the process of money creation on such a gigantic scale. A part of the explanation may be that there occurred a net outgo on account of repayment of instalments of compulsory deposits impounded in 1975-76 and 1976-77 out of dearness allowance and wage increases of employees. This outgo has to be netted against receipts under the two income-tax payers (compulsory deposits) schemes, which are now at enhanced rates. Though precise

figures in this respect are not available, the net outgo on this score would not be more than Rs 250 to Rs 300 crores. Also, the outgo should have been slightly higher last year.

The second factor responsible for the currency expansion is the net addition to the foreign exchange resources of the banking system. Despite a foreign trade deficit on merchandise account of about Rs 1,000 crores, the net addition to the foreign assets of the banking system in 1978-79 was Rs 975 crores, just one-half of the expansion last year (Rs 1,934 crores) when there was a trade deficit of Rs 693 crores.

These two factors, which may be said to be technically outside the control of the Reserve Bank, have certainly not made a larger contribution to currency expansion in 1978-79 than in 1977-78. Yet, the expansion (Rs 1,568 crores) was twice as large as in the previous year (Rs 755 crores). One explanation is the Central and state governments' dependence on Reserve Bank's created credit which has been much higher (based on last Friday, March 30, 1979 figures, which may undergo some change in the March 31 accounts) than last year. RBI's net credit to government aggregated Rs 1,176 crores against only Rs 169 crores last year.

The Reserve Bank may claim that government dependence on its credit is beyond its control. Even so, the Reserve Bank is culpable. First, when the government is injecting such a vast amount of credit into the system, the Reserve Bank has to evolve countervailing measures to counteract the expansionary impulses. Second, and more important, the Reserve Bank itself has been responsible for injecting as much as Rs 215 crores into the system during 1978-79. Compared with 1977-78 this was sizeable, for there was a decline (of Rs 591 crores) in commercial banks' dependence on the Reserve Bank in that year. In addition, the Reserve Bank also gave directly to the commercial sector — in the form of loans to IDBI, SFCs and ARDC and subscriptions to rural debentures and to shares and bonds of these financial institutions — an amount of Rs 295 crores against only Rs 56 crores the previous year.

All these developments have taken place not at the dictates of the commercial banking system, nor of the Reserve Bank or the government. They have occurred because the bigger borrowers from the banking system wanted them to. Last year price expectations had remained under check and so the expansion of commercial credit from the banking system was moderate — a situation which continued even during the first half of 1978-79. However, with widespread floods and political uncertainty on the horizon, traders and merchants started nursing higher price expectations and hence from mid-September 1978 onwards there were large credit drawals, which prompted the Reserve Bank to try to introduce a macro level credit ceiling in the form of a 40 per cent incremental credit-deposit ratio for the period December 1978 to March 1979. This was indefensible in both principle and content. First, the credit needs of the non-food sectors was not related to the bank deposits generated, but to the level of non-farm production and other related activities. Second, the Reserve Bank has had enough experience with macro ceilings on credit, which it has imposed twice in the recent past, once in the 1973-74 busy season (November-April) and again for the entire fiscal year 1976-77. On both the occasions the policy was to meet with the same fate — actual credit expansion was twice the targeted figure.

The reason is simple. There is a basic contradiction between the Reserve Bank's macro objectives and individual policy decisions. There is complete absence of a policy frame, which links policy objectives with policy instruments. If credit restraint is the policy objective, the granting of credit limits and the utilisation of credit limits have necessarily to be regulated. In fact, however, the Reserve Bank has considerably liberalised the system of granting credit limits through its Credit Authorisation Scheme (CAS). Though the CAS system had been initially introduced to achieve some alignment of credit expansion with Plan priorities, the Reserve Bank has failed to develop any method of achieving this objective. As a result, the Reserve Bank merely duplicated the credit appraisal of the commercial banks. No credit discipline among the large parties could be introduced and the phenomenon of siphoning off funds has gone on. Instead of reviving the original objective of this instrument, of looking at the totality of the credit limits sanctioned and utilised by the major parties in the key industries separately, of aligning such credit drawals with the level of physical activity (output, employment and investment), and of detecting speculative uses of funds, the Reserve Bank has virtually given up the whole prior credit limit approval mechanism, throwing the baby away with the bath-water.

If control on granting of credit limit has thus been blunted, there are no instruments for regulating utilisation of credit limits either. The credit limits are granted [illegible] of accounts spread over thousands of branches. Even bank chairmen [illegible] know what is going on regarding the granting and utilisation of credit limits. In such a situation, only two instruments would have restrained the utilisation of existing credit limits by the bigger parties: (i) higher margins and (ii) higher interest rates. The weapon of interest rate has been totally blunted by the imposition of a ceiling, initially 16.9 per cent on March 19 and later lowered to 15.5 per cent from March 1979. The ceiling has been mad[illegible] applicable even to selective credit controls. The instrument of margins has not been made use of at all.

Given this absence of any link between objectives and instruments, it is not surprising that for the third time the Reserve Bank has completely failed to achieve the macro-level credit target ceiling set by it. The 40 per cent incremental credit-deposit ratio meant that the expansion of non-food gross credit between December 1, 1978 and March 30, 1979 should not have exceeded Rs 785 crores. Instead, the actual expansion has been almost double, i e, Rs 1,442 crores. As in the past, the Reserve Bank is likely to attempt various explanations, though it can no longer claim that the system of prescribing a credit ceiling is a new experiment. Here one is tempted to recall how the failure to achieve the quantitative aggregate ceiling prescribed for the 1973-74 busy season had been explained away: "This is the first time in India that stipulation of [illegible] quantitative limit on credit expansion has been attempted, and it has known that the assessment could not be precise . . . A Plan prepared by the Central Banking Authority not on the basis o[illegible] indents from the users and scrutiny thereof but on general considerations and which moreover has to seek to cover the needs of thousands of industrial and other units, suffers from even greater difficulties and uncertainties." Five years have elapsed and again th[illegible] expansion of non-food credit has been twice the target. Further, if the so-called general considerations have any meaning for macro-level economic and monetary management, what has the Reserve Bank done to improve its method of achieving the desired objectives? The Reserve Bank should hav[illegible] realised by now that unless effectiv[illegible] instruments are employed, it is impossible for it to achieve the credit ceiling objective. The bank manager and the bigger parties drawing credit have a stake in defeating this objective and there is nothing in the policy instruments to prevent them from doing so.

KARNATAKA

Implementation of Land Reforms

Problems and Prospects

S X James Melchior

MERAMAJAL PEOPLE'S MOVEMENT (MPM) in Dakshina Kannada district of Karnataka has been attempting to organise and educate tenants on their due rights under the Karnataka Land Reforms Act. In the course of these efforts at education and organisation, the movement has been subjected to landlord and police violence and on March 15, 1978 the leadership narrowly escaped an attempt at broad daylight murder. Paradoxically, the very same establishment that promulgated the Karnataka Land Reforms Act has also attempted to suppress the tenant movement in Meramajal and other hamlets in coastal Karnataka. Therefore, what is to be the vehicle for the actual implementation of agrarian reforms?

Categorisation of Classes

Before we proceed it would be useful to have a broad categorisation of the agricultural classes and their holdings in coastal Karnataka. Thus, landlord: 50-60 acres; rich peasants: 20-30 acres; middle peasants: 5-7 acres; poor peasants: 2½ acres; agricultural labourers: 5-10 cents or nothing at all. With this pattern of landholdings, each category has its own interest/clout/economic pursuits, and this has put a formidable brake on the unleashing of productive forces. The Karnataka Land Reforms Act is progressive and welcome precisely because it attacks, however unspiritedly it may be, the existing power structure.

The landlord class is at the apex of the feudal structure and reaps huge revenue out of the labour of the last three categories who form the majority. The surplus thus obtained is ploughed back into the fields in order to improve methods of cultivation and introduce modern agro-technology. More recently, sensing the potential threat of the land reform legislation, the landlord class has tended to invest the surplus in oil mills, tile factories etc, aided by government financial institutions. The landlord class has also entered professions like medicine, law, engineering and politics with a view to establishing close links with their city counterparts and representatives of government.

The character and role of the rich peasants are virtually the same as that of the landlord class, except that the rich peasants have less political and economic clout than the landlord class.

The middle peasants are those among whom every one in the family works in the fields and the income is barely enough to maintain the family. Some members of family have to take to subsidiary employment like toddy tapping or beedi rolling. Before the land reforms act came into force, these peasants were forced to pay a high land rent. Some of the middle peasants study upto matric and many of them leave the village in search of jobs.

Poor peasants are those whose produce lasts them for only six months in a year. The rest of the year, the poor peasants have to seek employment as agricultural labourers. They are also heavily in debt mainly to the landlords. Their daily struggle for survival creates in them a negative attitude to life and a stoic renunciation that nothing will change. Their children do not go to school beyond the primary school level; some never go to school. Among the Christian families, some children reach upto high school and hide themselves in seminaries and convents where they will not die of hunger. As the poor peasants do not enjoy any occupancy rights, none of them are beneficiaries of any government programmes.

Landless labourers are the most exploited section of rural population. They are virtually enslaved to the landlords and other dominant classes throughout their lives. Religious myths are also deftly used to further enslave the landless. The result of all these manipulations is that the landless class is actually made to feel secure in its dehumanised condition. The philosophy of escapism easily grips them and they slide into habits like drinking, gambling and staging cock-fights. A section of the landless peasants is retained by the landlords as their agents and goondas.

Testimony of a Tenant

Nonu Mukari has been a tenant for thirty years under a landlord of Benjanapadavu. The landlord is a member of many 'humanitarian' clubs and enjoys a big status. Nonu Mukari's harrowing experience of land reforms is described in his own words:

I am Nonu Mukari, a harijan tenant of Benjanapadavu. My father and myself have been tenants of the landlord's wife's family for the last 50 years. I have been enjoying seven acres of land and cashew plantation and paying land rent to the landlord for the last 15 years. When land reforms came I refused to submit the application. Social workers, together with the local MLA persuaded me to file the application according to the land reforms act. No sooner had I submitted application, the landlord began to make complaints to the police and as a result police harassment followed. I was frightened, hence I left my holdings and ran away. I hid myself for two weeks. Through the social workers, I was able to meet the local MLA and lodged complaints against landlord and police violence. I also sought injunction in the Land Tribunal.

The Land Tribunal at Bantwal made me go to Bantwal more than 40 times. After this prolonged period, the Tribunal was forced to come to the spot and conduct a spot enquiry. Although 15 persons came forward to give evidence and written statements in my favour, the landlord abstained on the day of the spot enquiry. Nevertheless, the Tribunal, at the directive of the local MLA, gave its verdict in favour of the landlord. [Because of the pressure put by the movement the local MLA had apparently sided with the tenant, but he double-crossed.] The Tribunal arbitrated only 39 cents out of my seven acres, and asked the landlord to occupy the rest of the land which was in my possession.

The local MLA, though supposedly a communist and peasant leader, took me to the landlord's lawyer for a compromise, before the Tribunal could give its verdict. Since I refused the unjust compromise, the local MLA persuaded the Tribunal to take away the land in my possession and hand it over to the landlord.

My landlord is already in possession of 60 acres of land. He is a doctor of medicine and has many other ways of making money. Prior to this conflict with the landlord, under the patronage of my landlord, I could earn Rs 2,000 per year and look after a family of twelve in the house. Now, as a result of the land reforms, I have become a total pauper. I am not even able to grow vegetables and am today an agricultural labourer and a casual worker.

Though my application was filed under section 48A(1) of the Karnataka Land Reforms Act, the landlord got his workers to occupy the land in my possession, cut down my trees and dug wells to show that he has made improvements on the land coveted from me. Now, the landlord

has become the actual possessor of the land, though my land case is still before the Tribunal. I will not be able to convince the Tribunal that it is indeed my land.

The case of Nonu Mukari is not an isolated case of further pauperisation as a result of the implementation of Karnataka Land Reforms Act. He is only one of the thousands of tenants who have been pitted against the powerful, educated and moneyed landed gentry by virtue of the land reforms act. Having initiated the struggle between the tenant and the landlord, the Act is totally remote from the aftermath of the struggle. Nevertheless, even the shortcomings of the measure and the failures in its implementation hold useful lessons for future efforts at mobilising the rural poor.

Shortcomings and Failures

The tenants, for long under feudal oppression, have been dehumanised resulting in their utter despair and hopelessness. As a result, though the Karnataka Land Reforms Act provides a legal forum, the tenants are unable to assert their rights. Even if the younger elements amongst the tenants attempt to break out of the dehumanisation mould, such attempts are foiled by brutal violence by the landed gentry.

For example, Poovapa Mulya of Meramajal village incurred the wrath of the principal landlord for helping the MPM in filing the applications. He was beaten up before his own parents, and his mother, herself a favourite 'keep' of the landlord, was made to disown her son. Finally, Poovapa Mulya was done to death in the forest and his remains were discovered after 40 days. Hush money was paid to his parents to persuade them to come out with the story that Poovapa was possessed by a demon and hanged himself. This incident was highlighted to demonstrate to the other tenants that the demon would not spare them if they defied the landlords. In fact the landed gentry have always used the all-pervading superstition to peddle the idea that land reform is a conception of evil spirits and the tenants should have nothing to do with it. Thus, a man hired by the landlord and supposedly possessed by the spirit speaks the Word of God, conveying divine blessings to the landlord and the police and showering curses on those who have filed the application before the Land Tribunal. Even when someone dies of malnutrition or TB or other diseases, the dominant classes tell the tenants that such a calamity overtook them because they went against the landlords and filed applications.

A feudal set-up gives birth to a morality, outmoded and obsolete in its conception, to which the tenants pledge total loyalty. One of the tenant leaders, guilt-struck by his act of filing the application, stated: "We have been taught to give to God what is his due and to the King what is his". According to this morality, the landlord is the head of the village family and the government is wrong in taking away land from the village patriarch.

Prior to the land reforms act the tenants did enjoy security of sorts under the landlords. Exploitation, exorbitant land rent and lack of ownership were accepted, and the fringe benefits accruing from the unflinching loyalty to the landlords were taken as gifts. The landlord was the protector, arbitrator and the big-brother.

This neat and exploitative relationship was shattered by the land reforms act. The tenant was suddenly pitted against his father figure in litigation, harassment and conflict. The known hell of a feudal life was apparently slipping away under their feet; but the vague visions of a promised land which were held out could not be realised without struggle and without their becoming victims of violence.

Women belonging to the tenant class had always been made to look upon the landlords as symbols of the most perfect manhood. For them, their menfolk getting into a headlong conflict with the landlord was a preposterous proposition. To overcome this innate sense of inferiority and submission, the Meramajal People's Movement organised the women.

There were other problems as well that had to be overcome. The local agents of the landlords — the teachers, shopkeepers and panchayat office-holders who after all are the value givers — were persuading the tenants to ignore the land reforms act. The law itself was promulgated in a far off city and in a foreign language to which tenants could not have access. Nonu Mukari, for instance, came to know about the Act after full three years. Thus the much better placed dominant landed gentry were often able to subvert the provisions of the Act. The tenants, who were never used to the legal machinery, had to go to the village accountants for survey numbers of their plots. The latter made fortunes out of the ignorance of the tenants; they also created a false impression that once the tenants obtained survey numbers, they would become owners of the land.

Lack of documentary evidence was another major hardship. In Dakshina Kannada district, where the zamindari system prevailed for long, few documents have been preserved. Consequently, the small and marginal farmers had no documents to prove their tenancy. There was also the problem of the constantly shifting bureaucratic cadre. When one bureaucrat transferred the cases to his successor, there was increased delay in the settlement of disputed cases.

Role of Land Tribunal

The members of the Land Tribunal for the most part tend to identify themselves with the landed gentry. Even if some members of the Tribunal are drawn from the oppressed class, they in their eagerness to be accepted by the upper crust and lured by power, tend to abandon the cause of their fellow poor tenants. In Meramajal, two such members drawn from the oppressed class used their membership of the Tribunal only to enrich themselves.

Often, the membership of the Tribunal becomes another name for political patronage. The 'sitting allowance' and other perquisites as well as the social prestige and the feeling of being 'wanted' for grease money creates a vested interest in prolonging the process of litigation. Thus a new class alliance is forged with the local dominant groups.

Though the Land Tribunal is supposed to be a people's court, it virtually becomes a legal court by demanding the parties to produce documentary evidence. The landlords, well trained in the act of litigation, are always one up over the uninformed tenant. In the early stages of the functioning of the Tribunals, there was discrimination even in the sitting arrangements for the tenants and the landlords.

The Land Tribunal tries to deal with too many cases the same day. Though it actually handles only about five cases per day, notice is issued to a very large number of persons to come with their witnesses. The tenants, with their witnesses, hang around the Tribunal building the whole day and return home with added frustration.

The Meramajal People's Movement attempted to bring equality between the tenant and the landlord before the Tribunal. For instance, it saw to it that the tenant spoke first, not the landlord. It attempted to make the Land Tribunals work like a real people's

court. The Tribunals were forced to deliver the verict right in the village before the public. Recently in Meramajal, the Tribunal sat in the village and decided 78 cases. Any lies, either from the landlord or from the tenant, were subjected to the careful scrutiny of the public. For instance, a Christian landlord (who is also a lawyer by profession) argued his false case before the tribunal. *Had the Tribunal sat in camera*, the glibtongued lawyer would have got away with his lies. But in this instance, he could not succeed because the village public knew all about the case.

The idea of 'spot enquiry' right in the village was perused by the MPM. Consequently, a new methodology was evolved. First, the Tribunal served notice. Then, after the two parties reported to the Tribunal, the land would be surveyed and map drawn up. The landlord and the tenant would then be called If one of the parties had any misgivings, the Tribunal conducted 'spot inquiry' after which the final verdict would be given. But this methodology has been effective only when the tenant and the landlord agreed upon a consensus. In the event of a conflict, the Tribunal sits pretty and plays for time.

Merits and Limitations of Act

Because an attempt, however half-hearted, has been made to implement its provisions, the land reforms act has adversely affected the gentry. In a limited way, the Act has made an inroad into the feudal power structure. The existing 'peaceful' equilibrium has been disturbed. Feudal and semi-feudal relations, entrenched and well protected by the establishment, have been subjected to attack by that very establishment as a consequence of the promulgation of this Act. The rationale for this apparent paradox could be that the ruling classes have come to realise that by taking away the ownership of land from the hands of a few and vesting it with the actual tiller, there could be a more profitable and certainly more efficient production in rural India.

The Act places an enormous burden on the tenant to pay the compensation. This class, so far without any hope for tomorrow, has no savings. Since the land is mortgaged to the development bank, there is little resource left with the tenant for accelerating the pace of production on his land.

In the distribution of tenanted land, continuity of the plot is not taken into consideration. The landlords divided the land among the tenants in a haphazard manner in order to gain greater control over the inflow of water. The new peasant owners are hence often deprived of irrigation facilities and are also unable to consolidate their holdings. The undue and unwarranted delay in the issuing of the 'patta' leads often to police harassment and the landlord violence.

Seen from the perspective of creating an egalitarian society based on community ownership, the land reforms act might even appear as a retrograde step. In Meramajal village, prior to the land reforms, 10 families out of 500 held most of the holdings. After land reforms 200 families have come in possession of the land; but there are still the 300 families of agricultural labourers who are now left at the mercy of 200 families. The underlying philosophy of land reforms is that of the survival of the fittest. If I am a middle peasant and secure some improvements on my land, this is projected as an example of hard work and the other disadvantaged peasants are told to emulate my example. This is more an encouragement to individualistic way of life rather than a communitarian way of life.

Nevertheless, and on balance, the Karnataka Land Reforms Act is a significant first step in the liberation of the rural poor.

High Stakes in SGPC Elections

Amarjit Chandan

ON March 31, about 40 per cent of the over 35 lakh Sikh and Sahajdhari Sikh ('cleanshaven Sikh') voters of Punjab, Haryana and Himachal Pradesh cast their votes to elect the 140-member Shiromani Gurudwara Prabandhak Committee (SGPC), the apex body for management of Sikh shrines in Punjab and neighbouring states The Akali Dal, which has controlled the SGPC since 1965 and is now a partner in the Akali-Janata ruling coalition, got 132 seats (34 of its candidates were declared elected unopposed) while eight seats went to the Panth Khalsa Dal and Dal Khalsa In addition to the elected members, 20 'eminent' persons are nominated to the SGPC. The total number of contestants was over 1,000 Though the elections are supposed to be held every five years, the latest elections were held after 14 years.

Though no party or group came out with a formal election manifesto, a section of the Akali Dal (the Badal-Balwant Singh group) talked of 'fiscal autonomy', while the other section (Tohra and his allies) talked of 'fiscal and political autonomy' for Punjab. Both sections gave a communal tinge to the problem of Centre-state relations and described Sikhs as a nationality. The dissident groups raised slogans of 'Khalistan' and charged the Akali government with failure to solve long-standing issues like the transfer of Punjabi-speaking areas and Chandigarh to Punjab; they also alleged that the gurudwaras had become smuggling dens in the hands of the Akali Dal.

But were these the real issues at stake? During the Emergency a top Akali leader threw a challenge to a pro-naxalite fellow prisoner in Amritsar jail (now called 'sudhar ghar') that as long as Akalis controlled the Golden Temple (denoting religious and cultural hegemony), the communists should never think of coming to power in Punjab. For the Akalis, the SGPC elections meant a 'golak yudh' (war for church coffers) and controlling a religious body with an annual budget of nearly Rs 5 crores. In Punjab winning SGPC elections is a pole-vault to making a career in politics. Before 1947, Sikh politics, to be more precise Akali politics, had an anti-imperialist character. The Akalis first successfully fought to liberate gurudwaras from the debauched mahants (hereditary priests) and the Sikh Gurudwaras Act was passed in 1925 and the SGPC came into being. After that the Akalis fought for the liberation of India, which they called a 'greater gurudwara'. But after the transfer of power in 1947, the SGPC became the platform for launching political movements which were by and large communal and projected the demand for a Punjabi-speaking state as the demand of Sikhs only.

This time Akali dissidents posed a serious threat to the ruling Akali Dal and the Dal, therefore, threw all its state and private resources into the election battle. The Akali ministers, speaking from rostrums raised by the state public relations department, dis-

[illegible] state grants lavishly. The [illegible] for the withdrawal of nomination papers was extended to March 20. The voter enrolment conditions are so flexible that even one hour before the polling one could become a voter and the category of Sahajdhari sikhs is so vague that non-Sikh bogus voters are enrolled on a large scale.

Because of the elections, not a single Akali minister was in the capital. Jivan Singh Umranangal, the revenue minister, resigned from his ministerial post to fight the prestigious seat of Beas against a candidate put up by the Sant of Bhindranwale, the man who had sparked off the bloody Akali-Nirankari clashes last year. In Beas even school children were enrolled as voters and the Akali chief minister made a massive canvassing effort covering over 20 villages a day. Jan Sangh ministers and legislators also canvassed for the Akali candidates.

Other political parties — Janata, Congress (I), the CPI and the CPI(M) — were also keenly interested in the elections. The CPI(M) and Janata actively supported the Akali Dal, while the CPI and Congress (I) sided with the dissident Akalis. Interestingly, cadres of both the communist parties are voters in the SGPC elections.

The CPI had participated in the SGPC elections in 1959 as Desh Bhagat Board in alliance with the pro-Congress Sadh Sangat Board against the Akali Dal and had failed to secure even a single seat. Earlier that very year the CPI with the active support of the Akalis had waged a most impressive anti-betterment-levy kisan agitation against the Kairon government, but only a few months later there emerged the alliance with the Congress in the SGPC elections. The crushing defeat of the elections made the CPI think better of participating in the SGPC elections again.

KERALA

By-Election Politics

K T Zacharias

BY-ELECTIONS to the Kerala legislature from four constituencies are to be held on May 17. The uncertainty about the outcome of the elections is evident in the CPI leader M N Govindan Nair's statement that even if all the four seats are won by the opposition, it would mean no loss of confidence of the people in the ministry. The Congress (I) leader K Karunakaran has, however, declared that these elections would mark a turning-point in Kerala's politics. The CPI(M)-led opposition front too has taken up the by-elections as a challenge to the ruling front.

The four seats involved are Kasargode and Tellicherry in Kerala's northern-most district of Cannanore, Thiruvalla which lies to the south of central Kerala and Parassala in the extreme south bordering Tamil Nadu.

Two by-elections have already taken place in Kerala since the last general elections. In the first one in Kazhakuttom, former chief minister A K Antony won, but only with a reduced majority. By the time of the second by-election from Trivandrum east, important political changes had taken place, like the split in the Congress and the crossing over of the NDP, the political wing of the Nair communal organisation, NSS, to the Congress (I) camp. And in a close triangular contest, the CPI (M) won the seat. These two results showed a certain amount of erosion in the support for the ruling front.

But things have further changed since then. Reactionary political forces have got close to the ruling Congress and the ruling front because they consider that to be the only way to prevent the return of the CPI(M) to power. And the ruling front, in its own way, is placating these forces. One of the top leaders of the NSS, Sivasankara Pillai, has been appointed Advocate General of the state. The chairman of the SNDP, the communal organisation of the Ezhavas, P S Velayudhan, has been made the chairman of the State Farming Corporation. A splinter group from the NDP has been won over to the ruling front — at a price, it is said. In Kasargode, a representative of the Bhivarasabha who had filed his nomination as an independent has withdrawn in favour of the ruling front on the basis of an alleged donation to their temple funds.

In Tellicherry, the main contest is between CPI(M)'s N V Rajagopalan and CPI's K Sreedharan. Congress (I) is supporting an independent, A P Shanmukhadas. In the last general elections, Patyam Gopalan of CPI(M) had defeated CPI's N C Mammutty by a margin of 8,000 votes. It is said that Mammutty, a young local Muslim CPI leader, has been replaced by Sreedharan, an old guard of the communist movement, precisely to attract RSS votes. The CPI(M) candidate Rajgopalan is the party's crusader against the RSS and has been in the forefront of organising resistance against RSS attacks. Since the CPI(M) began its political offensive against the RSS through public meetings and demonstrations, innumerable clashes have taken place between the two and eight CPI(M) and five RSS workers have been killed.

"In these clashes, we are with neither", that was how P P Mukundan, CPI state executive committee member and member-in-charge of the Tellicherry elections, explained the CPI's position to this correspondent. "RSS is a political trend. Maybe it is reactionary. It has to be fought politically. We will accept votes from anybody, no matter whether it is an RSS vote or a Congress (I) vote." The CPI organ *Janayugom* wrote recently: "In spite of all the pressures that the Janata leadership may be able to exert in the name of all-India alliance, it seems the RSS at Tellicherry will not work for the CPI (M) candidate." CPI workers in Tellicherry town told this correspondent that the RSS will vote for the CPI to defeat the CPI(M). The CPI is also confident of capturing at least 2,000 traditional votes of the CPI(M) as well as some votes of the Congress(I) as it has no official candidate

According to the CPI(M) spokesman Pinarayi Vijayan, MLA, the state government machinery is on the side of the RSS. The attacks on the CPI(M), he alleged, have been carried out by specially trained volunteers who have come from outside Tellicherry They are camping at their secret training centres at Chettytheruvu, Thirurangadi and other places. This has been brought to the notice of the authorities concerned as well as the ministers. But no steps have been taken. A special type of dagger used for stabbing is left in the stabwound itself. On April 6, four beedi factories at Kayalodu, Kottiyodi, Champadu and Punnole were attacked with bombs, resulting in the death of three and wounding of 29 others, all Marxists. Not a single person has been arrested so far. Though CPI leaders spit fire against the RSS in Parliament, here in Kerala the government machinery has not at all moved against RSS violence. The CPI(M) has succeeded in bringing

together the [...] sections of the Janata party and they are jointly carrying on the election campaign.

In Kasargode constituency, RSS training centres are active at Mallikarjuna Devasthanam, Edaneeru Swami Muttom and other places. The CPI(M) has brought this to the notice of the authorities. By remaining passive spectators, the government and the ruling parties are actually encouraging the RSS. In Kasargode, the main contest is between the Muslim League (ruling front) candidate, T Ahmedali, and B M Abdur Rehman of the opposition League. In 1977 the Muslim League had won by a margin of 6,000 votes. At that time, because of an understanding with a section of the Karnataka Samiti, the ruling league had secured an estimated 3,000 votes, according to their spokesman. This time the Samiti has fielded its own candidate. Besides, the Congress (I) candidate is a prominent leader of the Kannadigas. All attempts to bring about an understanding between the Samiti and Congress (I) using the good offices of the Karanataka Congress (I), have so far not succeeded. If an understanding is ultimately brought about between the Samiti and Congress (I), there will be a keen triangular contest. Otherwise, it will be mainly a contest between ruling front League minus Congress (I) and a section of the Samiti on the one side and the opposition front minus the RSS on the other.

The Karnataka Samiti is not an innocent national minority movement. The highly chauvinistic and Hindu fanatic positions of a section of the Samiti have proved fertile soil for the RSS. Muslims constitute the largest single force in Kasargode constituency. Even in Tellicherry Muslim voters number 20,000. Thus in both constituencies, along with the RSS question the problem of Muslim minorities in relation to the Janata party is a serious issue.

The RSS in Kerala was originally confined to the Kasargode-Manjeewaram area. Later it spread down to Palghat with the support of the landlords of the area and now it has an all-Kerala spread, though its influence is still limited. The Karnataka Samiti has not been able to whip up any linguistic or nationalistic hysteria because beginning with the 1957 E M S Namboodiripad ministry, a number of steps have been taken in the field of education, employment, etc. to satisfy the cultural needs and aspirations of the minorities. A section among them have demanded the secession of certain border areas to Karnataka. At the same time, a considerable section of the Kannadigas, Konkanis and Tulus prefer the present position. It is the linguistic chauvinism fed by upper-caste and upper-class Hindus of these nationalities that has led to Hindu fanaticism and the birth of RSS in north Kerala.

Unlike Tellicherry and Kasargode, the RSS is not a political force in Thiruvalla where P C Thomas of the Janata is pitted in a virtual straight contest with John Jacob of the ruling Kerala Congress. The Janata has the support of the NDP while the splinter NDP supports Kerala Congress. Consequently, the Congress (I) is forced to carry on a lonely battle without allies. The official bio-data of every one of the candidates extols the role played by each in the 1959 anti-communist 'liberation struggle'. This is enough of a guide to the general character of the constituency. The CPI(M), however, has a basic vote-strength assessed between 13,000 and 17,000 and the Janata's battle is based on that. Being a Christian majority constituency, O P Tyagi's "Religious Persecution Bill", as it is termed here, and ban on cow slaughter are serious issues. The Kerala Congress is the most influential political force in this constituency. The Janata candidate P C Thomas was still recently one of the Kerala Congress's prominent leaders and the Kerala Congress candidate John Jacob was still the other day the local Janata leader. He had deserted the Kerala Congress to become the Janata candidate in the 1977 elections. A Kerala Congress dissident is contesting as an independent. The faction-ridden position of the Kerala Congress, it appears, as adversely affected its fortunes in this election. Besides, the votes polled by Congress(I) will leave its own gap in the ruling front's votes. Moreover, the NDP which was with the ruling front in 1977 is now with the Janata in this constituency.

Down south in Parassala, it is the Tamil minority in the form of the Nadar community and the issues affecting it that will decide the election. From 1952 onwards, in every election, a member of the Nadar community has represented this constituency. And this time too the three main political groups have fielded candidates belonging to the Nadar community. In a constituency of backward people, of weavers and palmirah tappers, of agricultural labour and poor peasants, economic issues are the live ones. But here again a considerable section of the Nadars are converts to various Christian denominations and as such the Tyagi bill and cow slaughter assume importance. The Congress candidate last time won by a margin of 13,000 votes over the CPI(M) candidate. The Congress (I) has an influential candidate in the person of N Sundaram Nadar who has the support of the NDP. P C Nadar of the Congress (ruling front) has the support of the splinter NDP whose influence is negligible. M Satyanesan is the CPI(M) candidate, while a Janata dissident Sundaresan Thambi is contesting as an independent. This is thus the one constituency in which the two Congress are locked in a struggle and it is only here that the Congress (I) has some chance of showing that it exists.

Viewing the by-election scene as a whole, one finds the RSS and the Janata misrule dominating the campaign. But for the political opportunism of the CPI in wooing RSS voters, the battle would have been straight on this issue. For the CPI(M) the Janata alliance is a burden which is taking all its politcal acumen to explain away. At the same time, the CPI(M) can claim that it is the only party which has now as well as in the past stood firmly against the RSS The ruling front as well as the Congress(I) claim that the CPI(M)'s influence among agricultural workers and the backward sections is on the wane. That the CPI(M) has not been able to expand its political influence is too visible to be ignored. The fortunes of the election will be decided by the way in which the once-Congress votes are divided between Congress (I), the ruling Congress and the CPI(M).

Ashok Leyland Limited

Ennore Madras 600 057

Speech delivered by Mr S Ranganathan, Chairman, Ashok Leyland Limited, to the Shareholders at the 30th Annual General Meeting of the Company held on 30th April 1979 at Ennore, Madras 600 057

Friends,

It gives me great pleasure to welcome you all to the 30th Annual General Meeting of your Company The Report of the Directors and the Accounts for the year ended 31st December 1978 together with the Report of the Auditors have been with you for some time now

In my speech last year I made mention of the Government s appreciation of the vital role of the Transport Industry and expressed some optimism in regard to the growth of the automobile industry You will be pleased to know that as a result of various steps taken by the Government in providing assistance to the industry, total production of commercial vehicles in India recorded an increase of 38% during the fiscal year 1978-79 over the previous year As you will have seen from the Annual Report, our own production during 1978 recorded an increase of 37% over the previous year

The increase in production has been possible with Government assistance in allowing import of critical components which were not available in the volumes required by us from our indigenous suppliers Import was also permitted of those items where we had capacity constraints But imports cannot be a permanent solution With increased inflow of imports, cost disparities between domestically produced and imported components have inevitably resulted in price increases of the finished vehicles.

Although it has been the Government s intention to keep under check the overall price situation in the country the recent Budget proposals have encouraged inflationary tendencies in the economy. The recent rise in price of steel and various other engineering goods coupled with the excise levies cannot but affect the price of our own products.

Recent developments resulting in the phenomenal increase in the world prices of crude oil has over-shadowed the many problems we are facing on the home front. It is a matter of considerable concern for all of us that we are once again faced with a situation of acute power shortage all over the country as a result of which amongst other things, we are already experiencing difficulty in obtaining supplies of materials and components Our own problems at Ennore have been compounded by the fact that we are unable to utilise our captive generating capacity on account of scarcity of diesel There would therefore, appear to be no escape, at least for this year, from continuing imports of critical components

I am, however, not unduly pessimistic as the Indian Automobile Industry is used to vicissitudes and we as in the past, shall treat them as a challenge and continue to maintain the growth in your Company, both in regard to production and sales

Inspite of substantial increase in the production of commercial vehicles the demand remains unsatisfied to a considerable extent Your Company has obtained Government of India's approval for increase in licensed capacity for the manufacture of medium duty vehicles to 12 500 per year and you will be happy to know that we have already taken effective steps for achieving this capacity as rapidly as we can In addition the Company has undertaken programmes for replacement and modernisation of production facilities and our request for soft loans to finance this investment has been approved by the financial institutions

With the increasing activities of the Company your Directors have decided to establish a second location for our manufacturing activities and a site has been chosen in Hosur, declared as a backward area by Government We are hopeful that our construction activity at this new site will commence within the next few months

The demand projections for commercial vehicles prepared by the Working Group on Transport Industry constituted by the Government of India, the recommendations of which have been accepted in principle by the Planning Commission, confirm the need for your Company to consider further expansion of activities and Government of India have also been impressing on us the urgency of our undertaking further expansion. We hope to submit very shortly an application to the Government for permission to increase the licensed capacity from 12 500 to 40,000 vehicles per year This will be a major step for your Company but I am confident that with the ability and maturity of your management team and workers this ambition is not beyond our capacity to achieve

Apart from expansion of volumes, we are actively looking at the upgradation of our products and the introduction of new vehicles Last year I dwelt at some length on the research and development efforts undertaken by your Company The new vehicle, Tusker, with a gross vehicle weight of 13 tonnes which was introduced last year has become extremely popular in the market and we are increasing our production of this model to meet the market demand An event of considerable significance during the year has been the development of an indigenously designed multi axle vehicle with a gross vehicle weight of 18 tonnes to carry higher payloads You might be aware that there is a legislative restriction in India on the load carrying capacity per axle and this new vehicle which has stood well in extensive field trials so far should provide the means of overcoming this constraint We have also entered into an agreement with Leyland Vehicles Limited for their providing know how for up dating the technology of engines and axles Your Company continues to accord the highest priority to Research and Development and it is our endeavour to keep abreast of technological developments and to design our vehicles in a manner which is best suited to Indian conditions.

With all these schemes for expansion, replacement and modernisation, research and development we are planning to spend during 1979 nearly Rs 18 crores on capital items which will amount to more than 11% of our turnover This size of investment reaffirms our confidence in the future but it is to be appreciated that this kind of spending will show up in depreciation costs and would therefore, have an effect on the profitability of the Company inspite of higher turnover

You will recall that during 1978 the Company capitalised a part of its General Reserve with the issue of equity shares as fully paid bonus shares in the ratio of one share for every two shares held Taking into account the capital as enlarged by the issue of bonus shares your Directors have recommended payment of a dividend of 16% subject to deduction of tax and you will no doubt agree that this compares very favourably with last year s dividend of 18% which was on a much lower capital base

The recent public issue was over subscribed about 14 times which you will agree is a clear indication of the confidence placed by the investing public in the management and future prospects of your Company The basis of allotment of shares as per the Government guidelines have been finalised in consultation with the Madras Stock Exchange, and the allotment will be made shortly

Following the sanction accorded by you at the last General Meeting the term of Mr F Holdsworth as Managing Director was extended upto 30 9 1978 but unfortunately he could not complete his full tenure due to ill health On behalf of you all I wish to place on record our appreciation of the services rendered by Mr Holdsworth as Managing Director to this Company and wish him well Mr R J Shahaney the first national to hold this post has succeeded Mr Holdsworth as the Managing Director of the Company I shall not dilate on his competence and dynamism

Mr D H Pitcher resigned as a Director during the year Mr D R G Andrews, also tendered his resignation as a Director of this Company in view of his other pressing assignments and Mr J D Abell has been appointed a Director in the casual vacancy caused by the resignation of Mr Andrews I wish to place on record my appreciation of the advice and assistance given by Mr Andrews during his tenure as Director Messrs R J Shahaney, C S S Setty, W K MacIver and R A Fryars were earlier during the year appointed as Directors they vacate office at this meeting and necessary resolutions are submitted at this meeting for their re-appointment

I would like to record our gratitude to BL Limited and Leyland Vehicles Limited for their continued support and active assistance in the development of the Company I would like to take this opportunity to convey our sincere thanks to the Central and State Governments for their encouragement and support and also to the financial institutions and our bankers for the support they have continued to give us in our day to day operations You will I am sure wish to join me in expressing our warm appreciation of the enthusiasm and loyalty of all employees and the administration of the management team which have contributed to the gratifying results we have been able to achieve during the year under review I must not forget to express the gratitude we owe to all our dealers and suppliers of materials for their continued support, which I am confident they will continue to give us

Finally on behalf of the Board of Directors and myself I would like to convey our sincere thanks to you, shareholders, for all the confidence that you have reposed in us, which has been our main stay in the management of the Company

NOTE This does not purport to be a record of the proceedings of the Annual General Meeting

SAA/AL/478

Steel Pricing and Distribution

S V Char

EFFECTIVE April 7, 1979, Ministry of Steel and Mines has marked up the base prices of all steel items by 15 per cent. This would be over and above the development and import surcharges. Effective the same date, the government has also imposed a surcharge of Rs 100 per tonne on pig iron. The price increases would also apply to quantities already held in the stockyards.

The latest rise comes on top of upward revisions of prices on September 12, 1978 by Rs 100 per tonne and earlier, on June 5, 1978, by an average of Rs 320 per tonne. Of this latter amount, Rs 100 constituted a surcharge on all items excepting plates, structurals, tin bars and railway materials to be credited directly to a development fund. Yet another amount of Rs 45 was towards freight subsidy again to be credited straight away to the Freight Equalisation Fund administered by the JPC. The additional revenues from the net increase in prices of Rs 175 could be shown as part of sales proceeds in the profit and loss account of the producers and help keep the wolf from the door. For instance, TISCO on its product mix could benefit to the extent of about Rs 24 crores in a full year which, however, is not permitted to be frittered away in dividends. The additional sales realisation is governed by a stipulation that the dividend rate for a period of three years should not exceed 12 per cent. The price hike in September 1978 was for the different purpose of subsidising the higher cost of imported steel released from the pooled buffer stock.

The latest 15 per cent hike and the June 1978 surcharge have been specifically for the purpose of building up the new Steel Development Fund replacing the Plant Modernisation and Development Fund which had been wound up on March 1, 1964. The PM and D Fund and its predecessor were both operated with the help of the retention price system which, since April 1, 1977, has also been dispensed with. In respect of pricing several basic goods and services such as steel, coal, railway transport and power generation, the supplies of which are mainly a public sector responsibility, there has always been a cast-iron case in India for de-emphasising the external social obligation aspects of pricing. But thanks to the all pervading system of subsidies and other fiscal gimmicks in respect of public sector pricing, such realism has yet to make itself felt. Consequently, dual pricing of steel propped up by the 2-tier distribution system has meant losses in profits — Rs 32 crores for the Bhilai plant and Rs 12 crores for the Rourkela plant, for example. Durgapur's loss increased by Rs 4.5 crores.

It has been admitted by the government that increases in the cost elements had 'eaten up' the additional funds which accrued from the June 1978 mark up. As a result, instead of a respectable Rs 100 crores in the development kitty, there was now only Rs 30 crores. Further, the concessional pricing of steel supplied to the small scale sector, sharp increases in entry taxes on raw materials in Madhya Pradesh on transhipments, falling production caused by inadequate coking coal and power supplies have also contributed to the deprivation of resources for the Fund. It is also indisputable that the impact of the railway and union budgets have been adverse on the finances of steel producers.

As a matter of fact, there has never been a dearth of arguments for marking up steel prices. Underrecovery of the inexorable increases in costs is perhaps one of the strongest. The Inter-Ministerial Committee on retention prices estimated that, between 1972 and 1976, costs of production for the entire range of JPC products had gone up by Rs 356 per saleable tonne but there had not been price increases of the same order. In July 1975, the increase in prices was Rs 80 per tonne with no compensatory increase for the balance amount of Rs 276. Thereafter, the costs of all major inputs, coal, refractories, tin, furnace oil, ferro-manganese, ferro-silicon, along with power tariff have gone up and the trends apparently are still upwards. Wage bills and other benefits to employees have increased substantially as have railway freight rates.

In this connection, one may recall the escalation formula under the retention price system. Upward revisions in prices were permitted whenever cost increases worked out to more than 5 per cent of the works' cost excluding depreciation. Nevertheless, despite a standing cabinet ruling to this effect, increases in steel prices till recently were slow in coming.

Such rigid regulation of prices is mainly because of the heavy forward linkages that steel, as an intermediate product, has with the rest of the productive sectors of the economy. Thus, *inter alia*, the overwhelming concern with general price levels has come in the way of the government agreeing to mark up of prices, although ever since October 15, 1973 there is no statutory control on price of any category of iron and steel.

What is disquieting about the latter-day price increases is the stage-by-stage mark up in prices instead of in one lumpsum. While in the past there was a measure of stability in the prices of steel especially of JPC items, over the past twelve months or so prices have been revised periodically, particularly in non-JPC items. For instance, they were marked up on 1.3.78, 4.6.78, 5.6.78, 12.9.78 and 7.4.79 or about five times in the course of about a year. Stockyard prices have gone up oftener — for example, thrice in a period of 96 days on 1.3.78, 20.5.78 and again on 5.6.78. The reasons for such revisions are not far to seek. As noted above, prices of inputs, in particular of coal, railway fares and freights, fuels, electric power as well as indirect taxes are themselves being put up and, fortunately for the producers, the earlier rigidity about revisions is much less in evidence over the past year or so.

The thinking on pricing of public sector products having undergone some perceptible change towards commercial pragmatism, it will not be long before steel prices are once again put up to cover an anticipated 25 per cent increase in coal prices, wages, fuel and so forth. Thus, before the dust of the April 1979 increase settles down, there would be another one, marginal or sizeable depending on the extent of the coal price and the wage hike.

The rationale advanced for the recent upward revisions in prices has been one of internal generation of a larger measure of resources to finance developmental outlay. But there is more than meets the eye here, as we shall see presently. The Sixth Plan has earmarked an amount of Rs 2490 crores for establishing new iron and steel capacity and for purposes of undertaking the development of other economic activities linked backwards to it. For the first year of the Plan, the revised estimate of budgetary support for SAIL alone was Rs 346.15 crores. For the current year, SAIL's capital outlay is Rs 444.97 crores against which the budgetary provision has been only Rs 214.97 crores. SAIL, therefore, would have to fend for itself to the tune of as much as Rs 230 crores. This

TABLE: COMPARISON OF BAZAR AND BSC PRICES

Items	JPC Ex-Plant price w e f 7.4.1979 Rs/T (1)	Wholesale Bombay Bazar Prices as on 14.4.79 Rs/T (2)	BSC (UK) Basis List Price as on 2.4.1979 Rs/T (3)	Column 2 as Percentage of Column 1 (4)	Column 3 as Percentage of Column 1 (5)

Pig Iron (Foundry Grade I)	1041	1700	1826	163	175

Notes: a = These prices relate to spring steel flats and for M S flats it should be somewhat less.
b = Depending upon the size.
c = Price relates to 14 G sheets.
(1) Price data in columns 2 and 3 and particularly in column 2 should be considered approximate merely indicating the magnitude of the prices, since they fluctuate considerably.
(2) To compute stockyard prices, stockyard handling charges of Rs 35 may be added to column 1.

Sources: (a) Compiled by the author on the basis of JPC Announcement No 182 of April 6, 1979 (Column 1).
(b) Personal enquiries (Column 2). (c) *Metal Bulletin;* April 3, 1979, p 35 (Column 3). Prices converted at an exchange rate of £ = Rs 16.91.

should mean putting up prices substantially, since costs are sacrosanct, not to be curtailed through better purchase management, inventory and production control, higher shop-floor productivity, etc.

These observations about SAIL are equally true for all other public sector producers and for the entire industry. The Plan outlay being Rs 600 crores and the government's assistance being Rs 365.63 crores it may be conceded that the targets and objectives in steel cannot be achieved unless internally generated resources are adequately enlarged.

The present supply and price situation is in sharp contrast to the one that prevailed some 18 months ago when there were solicitous thoughts of price reduction to clear accumulated stocks. Steel consumption at that time was also being sought to be promoted in the primary sector for bio-gas units, storage bins, foodgrain godowns, bullock-carts, etc, so that over a period perhaps the per capita consumption of steel may go up from the dismal 12-14 kgs to at least as much as that of Egypt, about 20 kgs. Earlier, it was even being stated that during 1976-77, the excess of availability over domestic offtake was about 2.185 million tonnes and, accordingly, 1.49 million tonnes of finished steel and 1.022 million tonnes of pig iron were also exported during the year. The country's emergence as a net steel exporter, it was believed, was not a happenstance. But today demand appears to have peaked with the indents from major consumers such as wagon builders, structural fabricators, wire-drawing units, electricity boards, automobile industry, oil refineries, construction and others having substantially gone up. The supply position is tight and the premiums are high.

The buoyancy in steel markets is evidenced by the fact that in the course of a relatively short period of about 22 months, the prices of even a raw steel item such as electric arc furnace ingots have shot up from around Rs 1340 per tonne to Rs 3025 per tonne in mid-April, inclusive of the levy of Rs 100+5 per cent (special duty) on April 9, 1979. In other words, mini steel ingot prices have shot up by 226 per cent and in the process both the ministeel units and their input suppliers have been able to make good hay when the market sun is shining bright. If steel consumers wish to make full use of the established capacity of about 3.9 million tonnes in ministeel units, perhaps there can be no better way to do it than by keeping up the present festive mood in the market.

There is ample evidence to establish that the steel authorities are not entirely innocent of the trends in the market while revising their own prices. Thus, in June last year, the price increases veried anywhere from 8.19 per cent in the case of billets to as much as 45.17 per cent in the case of plates (IS-226) or in absolute figures from Rs 131 to Rs 696. In the case of HR sheets, CR coils, CR sheets of the thinner gauges, the increases were over Rs 890 per tonne. But the heftiest increase in June last year was in respect of GP sheets of 20G and thinner whose prices were put up from Rs 3375 to Rs 4588. But even after the increases, prices have always been way below the ruling prices in the bazar, as is brought out in column 4 of the Table. In the bazar, foundry grade pig iron, for example, sells at 63 per cent more than the JPC prices. Prices of plates are 77 per cent higher. Rounds and Squares, perhaps because their prices are only 4 per cent higher, are not much transacted. Blooms and slabs are 17 per cent higher if at all they are available to the rerollers, who would be willing to buy them up even at higher prices, depending upon the bazar prices of their own end products.

It is also apparent from column 4 of the Table that except in the case of items such as CR coils and GC sheets, the British Steel Corporation's basic prices, even after the 15 per cent increase in Indian prices are 11 to 75 per cent higher, the largest price difference being in respect of foundry grade pig iron and flats of all sizes. It is thus clear that domestic prices in the UK

rule much higher than in India and that we have been following a cheap steel policy.

There is also a cogent case for upward revisions in the prices of a few items so that at least a part of the large premiums and the apparent consumer surplus which legitimately belong to the producers are mopped up. It would also be interesting to study what the market can bear without, at the same time, being apathetic to the heavy backward and forward linkages the industry has with the rest of the economy and the impact of such an increase on the economy. Dual pricing should not mean just cheap steel and cheaper steel, but more rationally, cheap steel and what-the-market-can-bear-price steel.

In this setting, the government may also enquire as to at what prices engineering goods (metal products) are being marketed and the margins of such manufacturers. It would not be surprising if the number of engineering units which price their end products as if they have bought their requirements of steel from the bazar is not small. They also have an enviable temptation to reroute their entire allotment to the bazar, which at times may be a more rewarding deal than adding value by manufacture and marketing the metal products. There is no reason why JPC, stockyard or SSI prices should remain low enough to offer such a temptation. That brings one to the more basic question of replacing the dual pricing policy itself by a uniform price policy which may after all be better for the producers as well as consumers.

It would be more meaningful to study pricing policy in apposition with the two-tier distribution policy introduced in May 1975 under which a leading role is accorded to producers' stockyards. What the producers and the sponsoring authorities allocate the market reallocates. The existing distribution policy, providing for deliveries ex-plant in rakeloads and ex-stockyard and *via* small scale industries corporations and through the trade, can do well with a few amendments. Some revamping can help to some extent in preventing artificial scarcities. The genuine consumers should not only be supplied adequate quantities at the right time and at the right price, but also the opportunities for rerouting the supplies should be minimised.

Most fingers point to the traders for the large premiums for practically all steel items and pig iron. But as a matter of fact, the trade is only the visible part of the widely ramified reallocation game. When they do provide a retail outlet for certain quantities of steel, they will not always be acting on their own. For this to be possible, steel allottees and other users, big or small, as well as some officials themselves, particularly at the stockyards, have to more than extend co-operation. Where else can the stock-in-trade of tested and quality steel come from, the traders being entitled to only off-grade, untested and defective material?

A major strong point as well as a weakness of the distribution policy relates to ex-plant supplies. The rakeloads (20 wagons of about 1,000 tonnes) of supplies direct from the plants to the actual users have in fact contributed to a measure of efficiency of the distribution system. But it has also resulted in large quantities being appropriated by large users, numbering about 800 when this policy was introduced in May 1975. It is true that the rakeloads are made available against irrevocable letters of credit which only the financially sound and mighty can afford and against unimpeachable documents from numerous government departments. But it is possible that the entire quantities are not immediately required but over a period of months. Therefore, stockpiling of steel and pickling of working capital funds cannot be avoided. There must be a less vulnerable system of assessment of requirements to be met by rakeload supplies for due incorporation in the distribution policy.

Secondly, consumers do inflate requirements while indenting. After meeting their genuine requirements, there is a sizeable quantity of left-overs which finds a ready outlet in the bazar. This hoary tradition of inflating needs is not confined to DGTD or SSI units but even to government departments and public sector organisations. There is no dearth of quota sellers in the market with eager bazar operators waiting to grab them for a fat premium. But thanks to the fact that there is no so-called statutory control on steel prices, this is innoculously being termed a premium.

It is true that hundreds of blacksheep have been identified and supplies to them have been suspended. A large number of them have been debarred from receiving further supplies for periods of upto five years. The DGTD and the SSI units under the umbrella of the Directors of Industries need to be watched more carefully. But what is really called for is a more vigorous discharge of the enforcement function by the regional officers of the Iron and Steel Control, making better use of Clause VII of the I and S Control Order 1956. A crackdown on both seedy SSI units as well as genuine allottees with phony steel requirements should have a salutary impact on the distributional mechanism. A pointer to the likely collusion between the allottees and the bazar is that the former lift materials generally when the bazar is 'tezi'.

For both the pricing and distribution policies to function without going haywire, it is axiomatic that steel demand is not allowed to outstrip supplies, but on the other hand supplies are at least a million tonnes (under the required categories) ahead of needs. Such an excess can constitute a bufferstock worked on an imprest system. Since both JPC and stockyard prices are listed, there can be no loss of revenue to producers, even if the bazar prices, on account of the buffer and official intervention in the market, remain steady or come down.

Even the best of techniques for projecting steel demand in the short, medium or long-term can only indicate the broad magnitudes of demand. But they let one down mainly because of the unforeseen discontinuities in the basic parameters, unreckoned-with structural changes in the economy and the stupendous problems in quantifying the co-efficients of consumption which are universally valid for all the units in the consuming industry and are close to actuals. Secondly, while quantitative techniques are helpful for long-term or medium-term projections, for assessing short-term requirements, there can be few substitutes for down-to-earth market research.

Be that as it may, there is at the moment no need to create a separate cell or division for monitoring the growth and demand over the short-term, medium-term or the long-term. The authorities concerned have all the necessary machinery for this purpose. They only happen to be nonperforming, almost philosophically accepting that the glut of yesteryears has given place to the present chronic shortage, mainly on account of a 15 per cent spurt in steel demand as against a projected 8 per cent annual growth. The six regional offices of the Iron and Steel Control need to play a more active role in this respect. As a matter of fact, one of their major functions is to undertake monthly market surveys for assessing the demand and supply position of iron and steel items. The data thus monitored should be followed up with the producers with pre-emptive action aimed at giving the slip to speculative forces and stabilising the market.

Albright, Morarji and Pandit Limited

Registered Office:

Raj Mahal, 3rd Floor, 84, Veer Nariman Road, Bombay-400 020.

Speech of the Chairman, Shri N Dandekar

Speech delivered by the Chairman, Shri N. Dandeker, I.C.S. (Retd.) at the Thirteenth Annual General Meeting of the Members held on Tuesday, the 24th April, 1979.

Good Afternoon, Ladies and Gentlemen.

I have pleasure in welcoming you to this THIRTEENTH ANNUAL GENERAL MEETING.

Today, I recall with great sorrow that just a few days after the last Annual General Meeting, our colleague Mr. P. R. Morarji expired on 2nd May, 1978. He was mainly responsible for the formation of your Company, and right from its inception, he was the invaluable guide and constant source of inspiration to your Board. In his sad and untimely demise your Company has suffered an irreparable loss. As a mark of respect to his memory, I request you, Ladies and Gentlemen, to stand and observe a minute's silence.

The Audited Accounts for the year ended 31st October, 1978 and the Directors' Report for that year have been with you for sometime now. With your permission, I shall take them as read.

You will have observed from the Directors' Report and the published Accounts that although the sales turnover of the Company increased by 20% both in quantity and value, the pre-tax Profit for the year (before providing for Investment Allowance Reserve) decreased from Rs 1,96,25,121 to Rs 1,82,80,937 due to rising costs. However, due to appreciable reduction in the provision for Taxation as also for Investment Allowance Reserve, the Net Profit for the year increased to Rs 64,10,937 as compared to Rs 59,79,121 last year.

To absorb the substantially higher cost of production, the Selling Price of Sodium Tripolyphosphate (STPP) was increased by Rs 600 per tonne (from Rs 5,850 to Rs 6,450) with effect from 1st February, 1979. Soon thereafter, the Excise Duty on STPP (which we recover from our customers) was raised by the Union Budget from 5% to 8% *ad valorem*.

During the first five months of the current year, i e November 1978 to March 1979, the Company has sold 9,323 tonnes of STPP valued at Rs 5.66 crores, as compared to 7,962 tonnes valued at Rs 4.58 crores during the corresponding period last year. This was not unexpected; and the outlook continues to be good.

I am happy to announce that the Sulphuric Acid Plant of 45,000 tonnes per annum capacity at your Company's Roha Works has started producing acid and the usual teething troubles are being rectified. The work of construction of the Sodium Hexametaphosphate Plant with 3,000 tonnes per annum capacity (the technology for which was developed by the Company itself) is progressing satisfactorily.

During the year under Report, your Company made donations to alleviate the distress and sufferings of people affected by the devastating floods in Andhra Pradesh. Likewise, a substantial donation of Rs 1,25,000 was made for setting up a school at Ambarnath to be named after the Late Mr P R Morarji.

Your Company's relations with its employees have been cordial; and I must thank all employees for the efficient services rendered by them.

I also gratefully acknowledge the continued co-operation and technical assistance rendered by our collaborators, Albright & Wilson Ltd and the Dharamsi Morarji Chemical Co. Ltd, both for the current operations as well as for expansion and diversification of your Company's activities.

I must thank all my colleagues on the Board for their valuable services, assistance and guidance.

Ladies and Gentlemen, I now have pleasure in moving the following Resolution:

"RESOLVED that the Audited Statements of Accounts of the Company for the year ended 31st October 1978 and the Directors' Report to the Shareholders be and they are hereby received and adopted."

Note · "This does not purport to be part of the Proceedings of the Annual General Meeting."

Utkal Machinery

UTKAL MACHINERY will supply India's largest concentrator plant for lead-zinc and lead-zinc-copper ores for the Rajpura-Dariba mines of Hindustan Zinc. This plant, near Udaipur, will have a capacity to treat 2,700 tonnes of lead-zinc and 400 tonnes of lead-zinc-copper ore per day. The order by Hindustan Zinc, a Government of India enterprise, is valued at Rs 11.8 crores The scope of work by UTMAL, a subsidiary of Larsen and Toubro, covers design, engineering, fabrication, supply, electrical and sophisticated instrumentation systems civil construction, installation and commissioning of the concentrator. The major facilities involved in the order are for conveying the ore, wet grinding, concentration by floatation technique, dewatering by filters and thickners and for water recirculation. The basic design know-how for the concentrator is from Sala International of Sweden, UTMAL's collaborator in the field of the ore beneficiation. The import content of the supplies is less than seven per cent of the value of the order. Fabrication of equipment will be done at UTMAL's works at Kansbahal, in Orissa, and at the Powai Works of L and T and by several sub-suppliers. Another subsidiary of L and T Engineering Construction Corporation, which is presently doing erection work of concentrator for the Kudremukh project, will do the civil construction and electrical and mechanical erection of the Hindustan Zinc's concentrator The commissioning of the new concentrator complex in 30 months will result in marked increase in the production of zinc, lead and copper in India.

Economics of Feudalism

Ranjit Sau

An Economic Theory of the Feudal System: Towards a Model of the Polish Economy, 1500-1800 by Witold Kula; NLB, London; pp 191. (Translated by Lawrence Carner from the Italian edition; original publication in Polish in 1962.)

THE celebrated Dobb-Sweezy controversy[1] was concerned with the transition from feudalism to capitalism in Western Europe during 14th-16th centuries; it had very little to say on the basic structure of the feudal economy and the tendencies thereof.[2] Kula's book, on the other hand, spends itself more on the question of the inner structure of feudalism in eastern Europe, specifically Poland, during 16th-18th centuries, and has equally little to say on the problem of transition as such. The two together, being complementary in scope, would provide economists and historians enough food for thought in these days of drought of fresh thinking and flood of 'eight-legged essays'.

I

Model-Building

What are the units of analysis, and where to begin? This is an important question in method. In his study of capitalism Marx, after a false start in the "Grundrisse",[3] began with Commodity, went on to Money, and then to Capital. This is not a historical sequence, but only a methodological procedure. Once it was tentatively suggested by Takahashi that an analysis of feudalism should adopt the following categorical development: peasant farm (virgate) — village community — manor.[4] Kula also takes these categories, but not in that order.[5] He begins with a full-blown feudal system complete with its demesnes, peasant farms and craft guilds. Kula clears the ground with the observation that every economic theory ought to explain four things:

(1) the laws governing the volume of the economic surplus[6] and its appropriation (e g, the laws which govern the use of extensive and intensive methods of production, the laws which determine the degree of utilisation of productive forces and of the existing means of production, and the theory of feudal income);

(2) the laws governing the allocation of productive forces and of the means of production, and above all the allocation of the surplus (i e, the laws governing investment activities of all kinds, from taking on peasant tenements to investments of a manufacturing nature, the problems related to the productive or non-productive utilisation of the surplus, etc);

(3) the laws governing the adjustment of the economy to changes in social conditions, i e, the short-term dynamic;

(4) the laws of the long-term dynamic, and above all the internal causes of the disintegration of a determinate system and of its transformation into a different one. No theory is complete unless it contains this last element.

In other words, the task of every economic theory of a system consists in formulating the laws governing the volume of the economic surplus and its utilisation (points 1 and 2), and these problems have to be explained in the short-term and in the long-term (points 3 and 4).

An indispensable precondition for constructing a theory of social phenomena is the social determination of human behaviour which ensures that human behaviour will manifest itself as a mass phenomenon, that it will be oriented in a single direction within the limits established by the social structure and that it will *re-occur* within specific limits of time and place whenever specific conditions recur. This takes place in all societies. For every society, therefore, we can in principle construct a theory that is more or less broad ranging, more or less articulated. But does it not presume a certain degree of 'rationality' in economic behaviour? If so, how far are the economic activities in a feudal system informed by the concept of 'rationality'?

According to the prevailing thought, the answer to the question whether rational economic activity is possible where free competition does not exist, determines at the same time the answer to another question. Is it possible to construct the economic theory of a system that is not based on free competition? We have to ask ourselves, then, whether rational economic activity is possible within feudalism. The answer to this question does not determine the answer to the other question, whether it is possible to construct an economic theory of the feudal system. It undoubtedly determines, however, many characteristics of any such theory.

Kula maintains that, given the concrete complexity of historical reality, there is no reason to state the problem in terms of a dilemma. The question of the possibility or impossibility of rational economic activity is a matter of degree, not of absolute alternatives. Every economic activity is traditional to a certain extent and rational to a certain extent. In the course of economic development we can observe an increase in rationality.

If we mean by rational economic activity the minimisation of means and the maximisation of results, we will then be dealing with a rational economic activity whenever: (a) there exists more than one possible solution under the given conditions of technical knowledge, and (b) there exists the possibility of making a comparison between the multiple solutions and choosing the most economical one. The possibility of carrying out rational economic activity becomes greater in direct proportion to the number of available alternatives and the precision with which they can be compared. Choices among economic options are always being made in all socio-economic formations. In no system, however, are these choices ever made in so-called absolute freedom. In other words, the choices are never determined by considerations exclusively related to economic calculations. Rather, the choices are always socially determined. They are recurrent choices which display certain regularities, and on the basis of which dependent relationship can be established. It thus becomes possible to construct a theory of every economic system, feudalism included. In the course of economic development the degree of rationality in economic activities increases because the number of alternatives from which one can choose in each particular case increases. The number of alternatives from which one can choose expands as a result of two functionally interconnected processes: technico-scientific progress and increasing 'elasticity' in the social structure.

In short, an economic theory of feudalism is possible, QED There is a fundamental distinction between short-term and long-term. However, for a classical positivist the long-term phenomena are also the result of short-term ones, just as macro-economic phenomena are the result of micro-economic phenomena. Kula argues against this view as follows: long-term variations, the processes of develop-

ment, are not at all the simple result of short-term processes; as F Perroux states "growth only has meaning ... as a phenomenon related to the transformation of structures". A whole range of variables which we have the right to overlook in research on short-term phenomena (eg, variations in productive technology, in productivity of labour and in demography), become essential elements in the treatment of long-term phenomena. On the other hand, a whole range of short-term phenomena — reversible and non-cumulative — can be set aside in the case of research on long-term trends. It is beyond doubt that economic facts are subject to continual changes. In all likelihood, this variability is directionless and chaotic for certain elements and within certain limits, whereas for other elements it is cumulative and oriented in a particular direction. This cumulative, oriented nature can be observed for the most part only over the long-run, whereas over the short-run we almost always have the impression of directionless variations. One might even risk a generalisation: in precapitalist societies many economic indices are subject to greater fluctuations in the short run and only to very slow change in the direction of the trends; in capitalist societies however, the range of short-term fluctuations is reduced, but the trend of changes in direction is accelerated and becomes more pronounced. There is, then, no doubt that certain elements change rapidly, others slowly or very slowly, and certain elements can be regarded as constant even though they may vary greatly in the short run.

II

Short-Term Dynamic

The feudal economy is dualistic in character; there is a small monetised sector co-existing with an overwhelmingly large 'natural' sector. Production takes place in demesnes and in peasant farms. The demesne carries out essentially an extensive form of farming — with serfs. On the whole, production is limited by the number of serfs. An economic system based on demesne and serfdom entails an agrarian regime in which the peasant plot is, in principle, generally a subsistence unit and no more. But in fact, the feudal lord needed some larger peasant plots to be able to carry out the basic part of the simple reproduction of the demesne's productive capacity: the maintenance and reproduction of work animals, the preservation and renewal of equipment, etc. This accounts for the fundamental importance which the division of peasant plots into two categories takes on in this economic system: on the one hand, plots which supply only labour, and on the other hand, plots which supply labour and work animals. The problem was that in practice it was extremely difficult to arrive at this optimal point, to fix the dimension of the peasant plots so that it was neither more nor less than a piece of land sufficient for sustenance and reproduction.

Extension of the demesne area at the expense of the peasant plots is the means whereby the lord is able to increase the surplus product. The division of the land between lord and peasant, in that it is the key to the partition of the product into necessary and surplus product and to the division of revenues between lord and peasant, overlaps with the division of peasant labour between the lord and the peasants themselves. Kula observes that in practice the tendency was to reduce the area of the peasant plot below the optimal point during good years, and this measure could not but upset the reproduction process. He goes on to add that "it was precisely this element which was to become one of the fundamental elements in the feudal economy's disintegration"; but actually he fails to integrate this element in his long-term model of feudal disintegration in Poland, as we shall see below.

The use made of the surplus product was generally for the purposes of personal consumption of the lord and his retinue — either direct or indirect consumption, since a portion of the product was exchanged on the market for other goods. Direct consumption was considerable and tended to increase. It also grew as one passed from the lower to the upper ranks of the nobility. The part of the demesne production set aside for the market is extremely volatile. The yield of the land was subject in those times to tremendous fluctuations according to the kind of the year it was, whereas the amount of things consumed within the demesne was almost constant in a given period.

Both demesne and peasant lands generally made use of the same extensive form of farming. Under such circumstances, investment in agricultural production essentially means extension of cultivated area, with certain raw materials like timber, and above all, the labour of the serf. Whenever, the lord 'invests' he does not pay with money; he either forces the serfs to work on it or increases the duties imposed on them. The decision to invest either had no relationship to the market situation, or else it had a very peculiar relationship. Investments were decided not because the market conditions had become more favourable to the demesne (as happens in the capitalist system), but on the contrary because market condition had *worsened* and the lord wanted to make up for the losses sustained by increasing overall production, to maintain his own standard of living and social position.

The iron principle governing the economic activity of the nobility is to minimise those expenditures which are to be paid in money, and to maximise the earnings of money, having no regard at all to the serf's labour which does not involve any monetary disbursement. It is the money fetishism which reigns supreme. This is best illustrated by the balance-sheet (1786-98) of a demesne belonging to a middle nobility. The money income is 13,826 zl 20 gr (one *zloty* is equal to 30 *grosze*), while the money expenditure is 3,988 zl 14 gr; that produces a money profit of 9,838 zl 6 gr. But the labour services by the peasants, reckoned at the ruling wages, amount to 16,236 zl 14 gr, should this be taken into account as a component of costs the above-mentioned profit turns into a big loss. Yet the estate is viable and it commands a market valuation of as much as 160,000 zl. Kula notes that similar phenomenon can be found in India as well. (Remember, Amartya Sen drew our attention to it in the pages of the *Economic Weekly*.)

In the short run, then, demesne production depends upon the number of serfs; but the yield on land varies from year to year depending upon weather conditions. In good years the lord tries to squeeze the peasant land and thus jeopardises reproduction. The marketed surplus of the demesne output is extremely fluctuating. The lord 'invests' in bad years of low production.

Kula's story of a peasant farm in feudalism does not exactly echo the idyllic of Chayanov.[7] In the economic system based on the feudal lord's demesne and on the peasant's bondage to the soil, the typical peasant holding is a small piece of land sufficient to feed a family and for purposes of reproduction. Contrary to Chayanov's demographic differentiation, in Kula's model the variations in the size of individual holdings are primarily due to an uneven distribution of the reproduction functions among them. The sum total of obligations that encumbered such holdings was so great that a

TABLE

Terms of trade of: Year:	1600	1650	1700	1750
Upper nobility	100	139	121	310
Lower nobility	100	180	190	181
Peasant	100	82	58	25

holding of this kind often could not alone allow him to become rich. If the peasant attempted to get rich too obviously the lord was an ever-present threat.

In a poor year the tendency was to pass the losses on to the lord. The peasant could keep up his consumption level by giving less to eat to the livestock which was more valuable to the lord than to himself; or he could even eat the grain that was set aside as seeds In a year of good harvest, the peasant plot produced a surplus which was taken by him to the market; this led the lord to reduce the size of the plot, or else to increase the volume of services incumbent on it. As a consequence, in a poor year this plot had to drop below the level of a piece of land that was sufficient to feed a family. Precisely for this reason, poor years become more and more common with the passage of time in a feudal system and an economy based on the demesne and labour rent; and peasants' debts to the lord mount up with time, reaching fantastic proportions. Also, the marketed part of peasant (as well as demesne) production fluctuates more wildly than overall production, even though fluctuations in the latter are enormous.

Nevertheless, since in the system under consideration the peasant is under no obligation to produce for the market since the services in money paid to the lord are of little importance and, when the harvest is sparse, are not often paid at all, since the purchases made by the peasant concerned are not indispensable, the peasant could survive without buying or selling anything; he could withdraw like a snail into his shell Precisely for this reason it appears that the periodic recurrence of lean years did not bring about any irreversible and cumulative changes in the village structure in Poland, such as those which certainly took place in eighteenth-century France and those which took place in the structure of the landlord's properties at the same time in Poland.

The peasant's investment possibilities do not depend at all on the volume of overall production or on the market situation Rather, it depends on the amount of labour — primarily family labour, on the amount of services due to the lord from this available manpower, and finally, to an equally important degree, on the local possibility of enlarging the arable area. But then, the lord periodically appropriates the area under cultivation which had increased thanks to the efforts of a generation of peasants. This 'stability' of the peasant farm is quite different from the picture protrayed by Chayanov.

III
In the Long Run

In Poland in the fifteenth century a switch over from a system of tribute-payments in money and in kind to an extensive system of labour services coincided with the growth of corn export, following the Peace of Torun in 1466, which had given Poland an outlet to the sea.[8]

The export market, through Danzig, was monopolised by the upper nobility, and provisioned by demesne production, while the lower nobility could capture only the provincial trading centres, and the peasantry's trade remained confined to isolated local markets. The export price of grain was stabilised, or recorded some gain, the price of imported products, mainly for the luxury consumption of the nobility, continued to decline As a consequence, the terms of trade moved in favour of the upper nobility

There emerged a determinate regional dependence in the prices. The prices of export goods go down as one moves upstream along the main rivers, and those of the imported goods behave in the opposite direction. Now, define the terms of trade as the ratio between the price of a certain quantity of rye and that of a relevant 'basket of goods' purchased by the concerned seller of rye The computation based on the data of the port city of Danzig is attributed to the upper nobility, and that on the basis of data from the provincial city of Cracow is related to the lower nobility. As for the peasant, he is assumed to sell certain quantities of rye, oats, butter, eggs, in order to buy a yard of cloth, about 60 nails and a barrel of salt, at the price prevailing at Cracow. The results are surprising, as given in the accompanying Table.

The gain of the upper nobility from the sharply improving terms of trade is astounding; and the loss suffered by the peasant is equally significant even though only a tiny fraction of the produce from the peasant land passes through the market. One remarkable effect of this phenomenon was the process of contraction that took place on the inland market in Poland. The terms of trade at Danzig are so much more favourable than in the interior of the country that the upper and lower nobility gradually withdraws from the inland market. For the upper nobility it pays to purchase the products of the lower nobility (who is unable to arrange long-distance transport), and even those of the peasantry, in order to transport them to Danzig. At the same time, such a serious worsening in the peasant's process whereby the peasant disappears from the town market as a buyer. Secondly, the computations of the Table also shed light on the problem of economic development (or rather the lack of such development), and on the problems related to the returns to labour and land, agricultural investments, etc The real value of the income of the feudal lord tripled over the span of 150 years between 1600 and 1750 (eight-fold in two centuries between 1550 and 1750), so that he was in a position to live off his income, and had no interest in considering productive investments. It is the peasant who might have tried to embark on investments to make up for the deterioration in the terms of trade, but his possibilities in this area were minimal. Thus, due to the occurrence of great world-wide changes, the Polish nobility, particularly the upper nobility, found themselves in the position of rentiers, 'coupon clipping' and profiting from the process of economic retrogression in the country.

There were tendencies for the demesnes to become economically strengthened, isolated, and naturalised. Naturalised, because every demesne attempted to purchase indispensable things, but to instead produce them from their own resources, without spending money. Production was to maintain itself on its own, and the basic elements consumed by the owner's family and his work force equally so All the liquid money derived from the sale of surplus production — which was to be as great as possible — was to be set aside for the purchase of luxury goods. There is, therefore, a tendency to maximise the naturalisation, the formula is paradoxical, but it accurately reflects the reality. Such was the objective that the nobility set itself.

The peasant tries to produce a little extra and to establish a relationship with the market with a view to buy a few essential things in exchange of his produce. The feudal lord sees in it an opportunity to expand his money. The creation of certain manufacturing enterprises within the latifunda aims at augmenting the methods for siphoning off the peasant's money. The lords attempt unceasingly to prevent their peasants from going to the town markets belonging to others, from going to church in villages belonging to others, from drinking in inns belonging to others. Only the economic isolation of the individual estates could guarantee that every transaction of the serf went to increase the flow money at the hand of the feudal lord.

Finally, there was an increasing trend towards the concentration of land at the upper stratum of the nobility. The upper nobility had its estates scattered over an immense territory which provided a sort of internal insurance against devastations brought about by wars or natural calamities. The large landowners often escaped unharmed from the misfortunes which led to the demise of the middle and lower nobility who could not survive a number of poor years in a row. Besides, the possibility of directly reaching the world market (i e, the port) — a possibility that existed only for those who produced and sold large quantities, i e, the large landowners — gave an enormous economic privilege to the upper nobility, since the terms of trade on the world market were more favourable than on the local market.

All the long-term tendencies discussed here are just so many paths leading to capitalism, says Kula. But then he asks: paths to capitalism in Poland, or to capitalism elsewhere? The fact that the latifunda developed in Poland, guaranteeing a base of inexpensive provisions and raw materials, was not without importance for the development of capitalism in certain parts of Western Europe. In any case, what happened next in Poland? Also, what happens next in Kula's model of feudalism?

IV

Transition to Nowhere?

The subsequent history of Poland is well-documented. In 1806 Napoleon declared the blockade; Poland's links with the world market snapped, and for various reasons they were never restored. The English custom duties on grain, the growing importance of capital investments in agricultural production, the competition from Russian and then American grain, made it impossible to return to the *status quo ante*. In the meantime few other changes took place: The rate of interest on monetary loans dropped to the level of agricultural estates' profit margin; the more or less illegal mobility of the population led to the near emergence of a wage-labour market in agriculture, the more or less lawful struggle of the peasants for access to the market gradually created the market. Feudalism in Poland went into liquidation.

It was, then, an abrupt shock from outside the model that shook up the foundation of feudalism. The inner structure of the model itself does not contain any dynamics of transition to capitalism. Had the model been allowed to operate, it would have led the system nowhere.[9] Of course, there is a seed of class struggle embedded in the contradiction between the feudal lord and the peasant, the former bent on reducing the peasant land to the minimum and the latter being no less zealous in expanding it and, in forging a link with the market. This contradiction need not reach the stage of antagonism, so long as the terms of trade continue to improve at the port city of Danzig. The nobility could well live off the swelling bounties of external trade, and by the same token, ease the pressure on the peasant. The model could go on merrily, if there were no changes in the scene in the external front.

Kula refers to the emergence of a labour market in the wake of mobility of the impoverished peasants. This reminds us of a query that Sweezy puts to Dobb. Does the serf leave the manor just because the conditions for existence become miserable? "I think not", says Sweezy. "The serfs could not simply desert the manors, no matter how exacting their masters might become, unless they have somewhere to go. It is true ... that feudal society tends to generate a surplus of vagrant population, but this vagrant population, constituting the dregs of society, is made up of those for whom there is no room in the manors, and it is hardly realistic to suppose that any considerable number of serfs would deliberately abandon their holdings to descend to the bottom of the social ladder."[10]

If initially the interest rate on borrowed money was above the profit rate on investment in a demesne, and if this was one of the factors that inhibited productive investments in agriculture, how did the interest rate later come down so as to stimulate those activities, as claimed by Kula?

If the home market for industry in Poland had shrunk for two centuries, and the peasants were forced to withdraw therefrom, how could it be regenerated within a span of forty years between 1820 and 1860 by the efforts of the peasants to establish a relationship with the market, specially when they had so little to offer for sale, and that too was extremely volatile?

Kula devotes barely four or five pages to the process of transition; he leaves a series of questions open. He himself sets the tasks of a theory: no economic theory of a system is complete unless it has the elements that ultimately lead to the dissolution of the system itself. By his own standard Kula leaves his mission incomplete. But certainly he has produced a stimulating treatise that will be debated for years to come.

In this world, class society emerged nearly 4,000 years ago; in this long historical panorama the age of feudalism spans over 3,000 years, while that of capitalism is barely 400 years, if not less. Yet we know so little about feudalism, far less than whatever little we know of capitalism. Kula has opened an important window into that area of darkness.

Notes

Democratic Kampuchea and Human Rights

Correcting the Record

David Boggett

This article seeks to demonstrate that

(a) the allegations against the government and Communist Party of Kampuchea of gross violation of human rights have been grossly distorted;

(b) the sources of the allegations are, in almost all cases, extremely suspect, having vested interests in discrediting the Pol Pot regime;

(c) the almost general appearance of such reports in the general Western press has been no more accident, but rather a concerted effort to conceal the true causes of the Khmer people's misery; and

(d) the restructuring of Khmer society by the Pol Pot government was not a fanatical attempt to put back the clock, but the only possible way for a responsible administration to alleviate the extreme miseries which faced the Khmer nation in 1975.

THE dearth of information in the regular press about government policies for the social and economic reconstruction of Democratic Kampuchea has only been matched by the barrage of almost daily allegations that the government and Communist Party of Kampuchea have been the worst violators of human rights in history, restructuring Cambodian society at the barrel of a gun and practising calculated and cold-blooded genocide against those allegedly considerable elements of the population which opposed them. Few people outside Kampuchea knew that the country was exporting a considerable rice surplus in 1977, but almost all had heard that a huge number of Cambodians had been liquidated, the precise number of victims varying from 500,000 to as many as 3 millions in the most extreme estimates. Faced with such a negative propaganda attack, no account of Kampuchea under Pol Pot can avoid addressing the problem of alleged mass violations of human rights. The nature of the charges themselves makes them extremely difficult to counter, the sources are usually not credited and, where they are, it is usually rendered by such vague terms as "according to refugees" and more often than not from information reported at third, fourth and even fifth hand. For example, a virulently anti-Kampuchean editorial appeared in the *"Christian Science Monitor"* (normally a liberal paper) on April 26, 1977, which turned out to be a fifth-hand rendering of events in Kampuchea; the only document the editor had read was a review by Lacouture which appeared in the *"New York Review of Books"*; the latter was based, in turn, on selections from materials published in the book "Cambodia in the Year Zero" by the French Father Ponchaud, and Ponchaud's material was based, in turn, on the reports of refugees who had fled Kampuchea! The further along the line the information passed, the less balanced it became ending up in the *"Christian Science Monitor"* as an extremely virulent anti-communist propaganda barrage aimed at the government of Democratic Kampuchea. The distortions that accompanied the information at each stage of transmission must have rendered it well nigh impossible for the Pol Pot government to reply sensibly or seriously, even when they were the official government in Phnom Penh, let alone for concerned researchers or scholars outside Kampuchea.[1]

The purpose of this brief article has, perforce, to be strictly limited, it does not set out to claim that nobody has been killed in Kampuchea since the Khmer Rouge takeover in 1975. (Such a claim would be meaningless and Ieng Sary himself has said that "some killings could not be avoided". The author has never heard of a mass restructuring of any society along revolutionary lines that was not accompanied by bloodshed, whether it be the French or Russian revolutions or more recent attempts such as that of the Ayotallah Khomeini in contemporary Iran!). But there is sufficient detail available to cause thoughtful persons at least to query the human rights allegations. This article seeks to demonstrate that (1) the allegations have been grossly distorted, (2) the sources of the allegations are, in almost all cases, extremely suspect having vested interests in discrediting the Pol Pot government; (3) the almost daily appearance of such reports in the general Western press has been no mere accident, but rather a concerted effort to conceal the true causes of the khmer people's misery by incorrectly blaming the Government of Democratic Kampuchea for terrible conditions in Phnom Penh caused by US policy toward the prior Lon Nol government and the Cambodian war; and (4) the restructuring of Khmer society was not a fanatical attempt to put back the clock, but the only possible way for a responsible administration to alleviate the extreme miseries which faced the Khmer nation in 1975.

Evidence of Population Statistics

In September 1978, the UK Foreign Office presented a report to the United Nations in which it claimed (according to Reuter's synopsis) "that Father Ponchaud gave it as his view in February 1978 that more than 100,000 Cambodians had been executed must be taken as the absolute minimum. It was possible that two or three times as many people had been executed. The number who had died because of the lack of food and of medical and sanitary facilities, and from the frantic pace of work, might well have been more than two million". The British government report can be taken as fairly typical in arguing that between 100,000 and 300,000 had been killed and that

about 2 millions might have died of other (remediable) causes such as malnutrition and lack of medical care. The figure of 2 million deaths (and note that "deaths" does *not* mean "executions") has been quite common. It apparently derives from a claim made in Paris and first widely reported in December 1977 by Reuters. The report reads, "An exiled Cambodian students group said Wednesday that more than two million people, one-third of Cambodia's population, had died since the Khmer Rouge took power in April 1975. *Quoting refugee reports*, the Union of Young Khmer Students (UNIJEK) said there were now practically no births in Cambodia because of famine, epidemics and Khmer Rouge massacres." More extreme reports of refugees in Paris even tried to suggest that all 2 million deaths were the result of direct massacres; an allegedly former Khmer Rouge political commissioner, Ear Soth, quoted in Paris "an official declaration made at an Assembly of victorious armies held at Battambang in February 1977. According to this statement 2,500,000 class enemies had already been killed since the takeover of power in April 1975. The statement added that the Communist party organisation (Angka) needed two million survivors to reconstruct democratic Kampuchea". Ear Soth was one of four recent refugees to be presented to the press by the indefatigable Father Ponchaud, all of whom had allegedly had high posts in the Kampuchean government and party organisations. In reporting the conference, Agence France Presse expressed some surprise that "the refugees were unable to give details of resistance to the ruling regime. They repeated rumours that guerillas were operating in the provinces of Kompong Thom and Kompong Cham". The US Embassy in Bangkok had also reported that they believed 1.2 million Cambodians had died (again note, not "executed") since the end of the war. The more extreme allegation of up to two millions dead or executed thus seems to originate among Cambodian exiles in Paris and the US Embassy in Bangkok. Moreover these same exiles were a major information source on whom Father Ponchaud has relied to cite evidence for his book "Cambodia in the Year Zero".

A mere glance at Khmer population statistics, however, shows that the 2 million deaths figure is impossible. In 1967, the population for Sihanouk's Cambodia was verified at 6,400,000. At the end of the war, AFP states the Khmer population was "estimated at seven millions". Ieng Sary stated in an interview with the *Der Spiegel* magazine in May 1977 that Kampuchea's population was 7,760,000. There is little reason to disbelieve this claim, for the not notably progressive *Far East Economic Review* of Hong Kong states authoritatively in its "1978 Yearbook" that the population of Kampuchea is 7,887,000. (The "1979 yearbook" sates 8.2 millions.)

It might be pertinent to wonder why the death of 2 million people (more than one quarter of the country's population) does not show in the population figures, particularly when the same dubious and already quoted sources state "there were now practically no births in Cambodia"! It should also be noted that the constantly rising population figures quoted above continue throughout the period of the Cambodian war. The Pol Pot government claimed that about 800,000 Khmers had died in the war period (this figure was never contradicted by any US authorities and can probably be taken as a relatively accurate estimate). Moreover, in the same *Der Spiegel* interview, Ieng Sary stated that "about 2,000 or 3,000 people died during the evacuation of the city (Phnom Penh) and another few thousand died in the rice fields". Other remarks made in the Ieng Sary interview were later found to be true. Countering the then current allegation that Sihanouk had been executed, Ieng Sary stated "He is alive and living with his wife in the former Royal Palace". Interestingly, this remark was also not believed at the time, until Sihanouk — embarrassingly for the rumourmongers — actually emerged publicly in Phnom Penh from the Royal Palace!) Whichever way one regards the population statistics, Ieng Sary's remarks seem probable; two million deaths are downright impossible.

The population statistics also reveal some interesting changes in racial composition. The 1967 census reveals that of the total population of 6,400,000 there were 330,000 Chinese (or 5.1 per cent); 300,000 Vietnamese (4.6 per cent) and 10,000 Indians. In other words, around 10 per cent of the total population where not Khmer. The 1978 statistics indicate that 99 per cent of the population are Khmer, and "significant ethnic minorities: none". This evident change has led some observers to suggest that the missing 9 per cent of non-Khmer peoples may have been the subjects of liquidation campaigns. It is certainly true that the Pol Pot government had little reason to feel sympathetically disposed towards the Vietnamese minority, most of whose roots in Cambodia go back to the time when they (rather than the Khmers) were imported under the aegis of the French colonial government to staff the nascent colonial bureaucracy. (Mutual Khmer-Vietnamese mistrust, of course, dates back even further.) But the disappearance of the Vietnamese minority is by no means the responsibility of the Khmer Rouge. Many of the 150,000 Vietnamese who lived in Phnom Penh in 1969 fled or were deported after the Lon Nol government staged a series of massacres of the Vietnamese minority in April 1970. In 1971 William Sullivan testified to the US Senate that only 3,000 to 10,000 Vietnamese remained in Phnom Penh. It is possible that the residual Vietnamese minority under the new Kampuchean administration might have been deported to Viet Nam, for the United Nations High Commissioner for Refugees reported on November 3, 1978, "The country with the largest number [of refugees] is Viet Nam where 350,000 people have fled from Cambodia". A later report dated December 10, 1978 stated, "More than 300,000 Cambodians have taken refuge in Viet Nam". It is more reasonable to suppose after the Vietnamese invasion of Kampuchea, that among these refugees were former Khmers of Vietnamese origin, and one can only presume that they are now again back in Cambodia. (This assumption seems plausible following the publication on January 13 this year of "a manifesto issued in Phnom Penh by the Kampuchean People's Revolutionary Council, headed by Heng Samrin to mark the establishment of the new 'People's Republic of Kampuchea' which promised, according to a Bangkok Kyodo News Service report, "freedom and equality between the sexes and among different ethnic groups". As 99 per cent of Cambodia under Pol Pot had been racially pure Khmer, one can only suppose that the "different ethnic groups" referred to in the Vietnamese-backed government's manifesto were brought back into Cambodia from Viet Nam by Heng Samrin and his cronies.) With regard to the other large minority noted in the 1967 census there is little evidence of particular distress. Ito Tadashi of Kyodo News Service who visited Democratic Kampuchea in September/October 1978 reported that, "Ny Kan (the Foreign Affairs Ministry official who accompa-

nied us on our tour) and the problems Viet Nam has had with its Chinese population have not touched Cambodia because all people in Cambodia, including the Chinese are, being treated equally. He admitted that those few who held special privileges in the pre-liberation days have had some problems adjusting". The Pol Pot government thus clearly claimed that there were Overseas Chinese still living in Democratic Kampuchea.

In short, the exaggerated claims that as many as 2 million Cambodians have been killed or had died since the liberation of Phnom Penh in 1975 are absurd and, when viewed against the population statistics and the then known numbers of Cambodian refugees (approximately 350,000 in Viet Nam, and more than 100,000 in France, Thailand and the USA), the lesser claims of between 100,000 and 300,000 massacred seem to stretch the population data. These figures appear to have originated from the roughly 12,000 Khmers living in exile in Paris. Of all the Cambodians abroad, those in Paris tend to come from the higher classes of Cambodian society since the French government gives priority to refugees who can already speak the French language or who have family members already resident in France. Most, thus, come from the French-educated Cambodian elite of pre-liberation days and, needless to say, have everything to gain from blackening as much as possible the reputation of the Pol Pot administration.

Cambodian Refugees in Thailand

But the Cambodian exiles in Paris are by no means the only source of human rights allegations against the Pol Pot government. Another source is the Cambodian refugees in Thailand who exist in special refugee camps close to the Thai-Cambodia border.[2] The most famous revelation of these refugees' stories was in *Time* magazine of April 26, 1976, in which it was stated, "Since the communist victory, 500,000 to 600,000 people — roughly one twelfth of Cambodia's population — have died from political reprisals, disease or starvation, and there is little evidence that the wave of death has crested. The country has become a kind of Indochinese Gulag Archipelago — except that the whole land is one island of oppression.' Its sources were, "News does leak out from refugees who have managed to flee to Thailand". The article was accompanied by lurid line drawings (prepared by *Time*'s artist) bearing such titles as "Artist's rendering of Khmer clubbing executions", "Plastic bag method for slow asphyxiation" and "Khmer Rouge soldiers bayonetting official". There was, of course, no photographic evidence of the alleged executions. Perhaps the most curious feature of this source of information on Democratic Kampuchea is the astonishing fact that there were no atrocity reports from the Cambodian refugees' camps in Thailand until almost a year after the liberation of Phnom Penh. Moreover, the timing of this information flow suggests that it may have been related more to the internal politics of Thailand than to Kampuchea. News of the existence of refugee camps for Cambodians in Thailand first started to appear under the liberation) Premier In Tam; "M R Kukrit Pramoj. During this Thai administration, Ieng Sary visited Bangkok on several occasions which resulted in the formation of a Thai-Khmer Liaison Office at the border town of Aranyaprathet, the start of trade between the two countries and a joint communique in November 1975 about the future establishment of diplomatic relations signed by Ieng Sary and Thai Foreign Minister Chatichai Choonhavan. But relations were still far from smooth between the two countries as evidenced in the series of border clashes that broke out towards the end of 1975. It was in this connection that the Kukrit government started to release information about the Cambodian refugee camps. On November 27, 1975, Premier Kukrit ordered the expulsion from Thailand of former Phnom Penh (pre-liberation) Premier In Tam; "M R Kukrit refused to discuss the reason for the expulsion of Mr In Tam who is now living near the Thai-Cambodia border, but said, 'He can't live here'" (*Nation* newspaper). On December 15, 1975 (more than two weeks later) the *Nation* reported under banner headlines "In Tam Still Here":

"Former Cambodian Prime Minister In Tam has slipped into the border area where Thai and Khmer Rouge soldiers are engaged in clashes, Foreign Minister Chatichai Choonhavan said yesterday. General Chatichai's statement thus confirmed that In Tam who had been ordered to leave the country within one week early this month by Prime Minister Kukrit Pramoj is still in the country. The minister also said that In Tam was taken to Bangkok, but somehow managed to slip back to the border again. He was supposed to leave for France. In Tam has announced setting up a liberation movement against the present administration in Cambodia which is now recognised by Thailand. *General Chatichai noted that the current border incident could have been incited by In Tam's people* or else it was caused by misunderstandings among low-ranking Khmer Rouge soldiers." (Emphasis added.)

Two days later on the 17th, the *Nation* reported "In Tam Meddled in Current Border Dispute", stating, "Prime Minister Kukrit Pramoj yesterday openly charged that former Cambodian prime minister In Tam has meddled in the current border dispute between Thailand and Cambodia in Klong Huay Hia of Ta Phraya District, Prachinburi. He said In Tam *who is staying in a refugee camp in Aranyaprathet* will be asked to leave the border area very soon. Foreign Minister Chatichai Choonhavan said he has asked In Tam to come to see him in Bangkok today or tomorrow."

But still In Tam managed to avoid leaving Thailand. A later *Nation* carried an interview with him at the Wat Chanachaisri refugee camp, where some light was thrown upon the "In Tam's people" mentioned by the Thai Foreign Minister in the previously-quoted report: "In Tam has altogether 119 relatives living in the refugee camp, and also some 60 of his followers... There are 2,551 Cambodian refugees in this camp and many young men said they are still loyal to In Tam. 'I'm ready to defend him with my life', said one tough-looking Cambodian ex-soldier."

That In Tam had been able to ignore the Thai government's instructions to leave the country is a clear indication of high support for his Cambodian activities within influential circles in Thailand (presumably that section of the military dissatisfied with the "soft" policy on communism taken by the civilian Kukrit government). The Kukrit government was overthrown by elections on April 4, 1976, and replaced by the fuddling government of Kukrit's brother, Seni Pramoj, under which the right wing Thai military started to move more openly, leading to the notorious "Bloody Wednesday" military *coup d'etat* of October 6, 1976. Lest there be any doubt of the military intentions of In Tam and his "refugees" a *Bangkok Post* report of November 29, clearly stated, "Former Cambodian Prime Minister In Tam, given a one-week deadline to leave Thailand, was yesterday named as one of the strong leaders of a Cambodian government-in-exile in Paris. The announcement, made by Col Sowattana, aide of former Cambodian Premier San Ngoc Tan in Paris, claimed

that 135,000 armed troops are on its side. Col Sowattana named In Tam and San Ngoc Tan as two former aides of former Cambodian President Lon Nol who have joined the government-in-exile... The 135,000 troops supporting the rebels, he said, are armed with sophisticated American arms delivered immediately after Phnom Penh fell to the Khmer Rouge on April 17 this year". And, presumably, many of those 135,000 troops were operating from In Tam's refugee camps in Thailand.

It was after the defeat of the Kukrit government in the April 4, 1976 Thai elections that the Thai military, In Tam and his "refugees" were able to operate more openly. It was not until that time that Western Journalists were invited to the Cambodian *refugee camps in Thailand, almost* a year after the fall of Phnom Penh. From these visits, articles such as the one quoted above in *Time* magazine started to appear. But some journalists who accompanied the group expressed their reservations about the accuracy of information gathered from the refugee camp inmates (particularly outspoken were Norman Peagam, Bangkok correspondent of *Far East Economic Review,* and John Everingham, former Vientiane correspondent of the same magazine). Evidently, upon entering the refugee camps, the journalists had been presented with pieces of paper on which each refugee produced for interviews had written of their experiences or the tortures/killings that they had witnessed. Interviews were held through interpreters from the camp staff. Naturally, many journalists paid for the information they received, giving out 20 dollar bills to informants. But when others looked over the pieces of paper (all written in Khmer script) they were surprised to find how many papers said exactly the same thing Moreover, those journalists who spoke Khmer language began to find that there were many refugees who could not speak the Khmer language at all, and that, moreover, hardly any of the refugees were actually able to either read or write! Some journalists began to suspect that they were witnessing a sort of stage-show arranged by the camp leaders for publicity purposes and which would, of course, bring in badly needed extra income. (These details were verbally related to the author by a former editor of the Thai *Phuen* magazine some time later in Bangkok.) No photographic evidence has ever been produced by any of the refugee groups, whether in Thailand or Europe. This, in itself, is perhaps not surprising, given the confusion that must have prevailed when many refugees left Kampuchea. The first photographic evidence of brutalities in Kampuchea did not appear until April 8, 1977 in the *Washington Post* which carried "photographs depicting forced labour conditions in the countryside, with Cambodians working under the guns of guards". It was only later learned that the same photographs had been offered to the anti-communist *Bangkok Post* newspaper a year before, in April 1976, but the newspaper had refused to print them; "the offer was turned down because the origin and authenticity of the photographs was in doubt", particularly because of "the way the alleged Khmer Rouge soldiers and those depicted to be villagers dressed other observers pointed to the possibility that *the series of pictures could have been taken in Thailand"* (emphasis added).

When the *Time* magazine report of Khmer "atrocities" was published, In Tam had at last departed to Paris to assume his more glorious post in the government-in-exile, but *Time* stated that the movement was still being directed — presumably still from within the refugee camps — by an (unnamed) "former Cambodian cabinet minister in the Lon Nol regime". The accuracy of the atrocity reports from Khmer refugees in Thailand is thus as questionable as the reports emanating from Paris (despite the fact that many of the Khmer exiles in Thailand are of a considerably less elevated social class than their Paris counterparts), it not only seems highly likely that the atrocity reports may have been fabricated to find a quick way of cash to fund the refugees, the camps and any related resistance activities, but it is also demonstrably provable from the Thai newspaper reports that In Tam and other former Lon Nol government leaders have been using the refugee camps as a center of military resistance activities against the government of Democratic Kampuchea. "Rumours" (a good Thai source of factual information) continue to abound in Bangkok about the refugee camps Eyebrows were raised in early 1978 when Thai police arrested 37 so-called "Thais" laden with guns and grenades in Pachinburi on the Thai-Khmer border area. None of the so-called "Thais" were apparently able to speak the Thai language. Police investigations revealed that they were refugees of Khmer origin, trained to infiltrate across the Kampuchean border and decoy Khmer Rouge troops back into Thailand in "hot pursuit" in order to cause Khmer Thai border incidents. The Thai army had sanctioned the activity but the "stupid" police, unaware of such plans, had routinely arrested the 37 armed "Thais". Nothing was ever done about the 37 for the army, in an unprecedented (and illegal) action removed the case from police to army jurisdiction [3]

It has also been discovered that a religious leader, a certain Thai Buddhist monk, Kittivutho Bhikun (Kittisak Jaraensathabawm), was supporting such military training programmes within the refugee camps. Kittivutho is a notorious figure in Bangkok social and political life, on the night of the Thai "Bloody Wednesday" military coup of October 6, 1976, Kittivutho broadcast over the military's "Armored Radio" urging those in Bangkok to kill "the communists" (students demonstrating in Thammasat University) to protect the Thai nation, the Buddhist religion and the King. His views had been widely publicised a little before in an interview in the *Chatturat* magazine in Bangkok:

"I think that even Thais who believe in Buddhism should do it [kill communists]. Whoever destroys the nation, religion and king is not a complete man, so to kill them is not like killing a man We should be convinced that not a man but a devil is killed. This is the duty of every Thai person.

Question. But isn't killing a transgression?

"Yes, but only a small one when compared to the good of defending nation, religion and king. To act in this way is to gain merit in spite of the little sin. It is like killing a fish to cook for a monk. To kill the fish is a little sin but to give to the monk is a greater good.

Question : So the ones who kill leftists escape arrest on account of the merit they gain?

"Probably."

Such savoury "religious" leaders as Kittivutho appear to be lending their support to the dubious activities of the Khmer refugees in Thailand.[4] It was also notable that the atrocity stories from the refugees started to fall off as soon as Thai government policy dictated other priorities. As mentioned above, the atrocity stoires themselves did not start until after the defeat of the civilian Kukrit government in the election of April 4, 1976; they reached their height

during the ideologically extreme rightist administration of Premier Tanin Kraivixien set up by the 1976 military coup; the stories then remarkably dropped after a less publicly ideologically rightist-committed military administration was set up in Bangkok by yet another military coup led by the present Thai premier, General Kriangsak Chomanan, in October 1977;[5] following the Vietnamese invasion of Kampuchea and the installing of the present Heng Samrin government, the atrocity stories have miraculously ceased altogether.

Vietnamese Propaganda

The third (and final) source of the atrocity stories and allegations against the Pol Pot government emanates from Hanoi and the Vietnamese government itself.[6] Over the Kampuchean invasion, the Vietnamese have been able to mobilise successfully all their many "progressive" foreign journalist friends, contacts built up by the remarkable and efficient Vietnamese publicity machine during the Indochina war. (The Cambodians never developed a similarly effective organisation in Paris or elsewhere during their war against the USA.) The effect of the Vietnamese-directed propaganda barrage against Phnom Penh has been devastating, as it has been penned on Viet Nam's behalf by journalists and intellectuals of "progressive" reputation throughout the world. Normally sensible commentators such as Australian writer Wilfred Burtchett and Japanese journalist Honda Katsuichi — with a high reputation for integrity — have parrotted the Vietnamese allegations, word for word. Honda Katsuichi's book against Democratic Kampuchea was entirely researched from Hanoi, where he interviewed selected "Cambodian refugees" in Viet Nam, specially chosen and presented to him by the Vietnamese Foreign Ministry, alleged photographic evidence of the massacres — also thoughtfully provided by the Vietnamese government — are totally unidentifiable, and could have been taken anywhere during any war (and there is no shortage of photographs of massacres and war brutalities in contemporary Indochina!). Wilfred Burtchett's information has been even more concretely exposed. Writing in the October 1978 issue of *Afrique-Asie* Burtchett claimed (as has the Vietnamese government) that a dozen leaders of Kampuchea, including Ok Sakun, had been internally purged. Richard Dudman, one of the two western journalists who accompanied Malcolm Caldwell on his fateful Kampuchean visit, reported in a January 1979 article, a meeting with the allegedly dead Ok Sakun:

"Ok Sakun, 45 years old, one of the intellectuals, engineers and economists who are often said to have been killed in internal purges. He said he worked in the Foreign Ministry. He mentioned Hu Nim, Minister of Information and Propoganda, and Hou Yuon, Minister of the Interior, Communal Reforms and Troops, as additional persons still active in the government who are regarded in the West as missing."

Vietnamese propaganda against Kampuchea, its admitted enemy, is best discarded for what it is; a series of fabrications and half-truths put out to discredit Democratic Kampuchea in the rest of the world in order to prepare psychologically for the planned Vietnamese invasion.

All three sources of "atrocity reports" — Khmer exiles in Paris, Khmer exiles in Thailand and the Vietnamese government — can be shown to be downright fabrications in their more extreme statements; they are at best a highly dubious source of information on events inside Democratic Kampuchea. Moreover, none of the opponents of Democratic Kampuchea have ever addressed the question of why a government committed to an agrarian revolution that needs actual *people* to work in rice fields should so thoughtlessly kill off so many persons, whose labour was so essential to the success of its agrarian policy. An official of the Kampuchean Foreign Ministry, Thiounn Prasith, reported to US journalist, Richard Dudman, "We have only about 8 million people. In Kampuchea there is no family planning. We need more and more people. We would like to have 20 million people in 10 years." (Quoted in the *St Louis Post-Dispatch*, January 1979.) One of the first Western visitors to Democratic Kampuchea, Swedish Ambassador to Peking, Kaj Bjoerk stated, "there is one factor that may speak against the probability of mass executions at this stage. That is their complaint about shortages of manpower and talk about the need of putting more people to work. In my view this indicates that they would rather put people to work than execute them" (*Far East Economic Review*, March 28, 1976.) In the *Der Spiegel* interview of May 10, 1977 Ieng Sary replied to the allegations of mass executions: "These people are mad. We only condemned the worst criminals... why should we have killed all these? We need a tremendous amount of labourers to rebuild the country."

Later, in Bangkok (July 19, 1978) at a press conference, Ieng Sary repeated, "If the government of Cambodia committed atrocities against its own people then it could not rally the people against the [Vietnamese] aggressors. Despite what refugees say, the government of Cambodia is one that serves the people; it has no reason to massacre its own people." Moreover, of all the Indochinese states, only Democratic Kampuchea has actually urged refugees abroad to return and help build the country (in marked contrast to Viet Nam's policy of actively encouraging the "boat people" to leave and face an uncertain future at sea in flimsy boats) and surely no government appeals to exiles to return, merely in order to execute them? Premier Pol Pot broadcast the appeal over Radio Phnom Penh on September 26, 1978: "All Cambodians abroad, in general, do not wish to live in those foreign lands, bu they stay there because they have been fooled by our enemies. If they want to return, no matter who they are, we will give them a cordial reception." Further, Ieng Sary on a visit to the United Nations, extended an invitation to UN Secretary-General Kurt Waldheim — which was subsequently accepted — to visit Kampuchea "to see with his own eyes the truth of human rights charges" (Associated Press, October 15, 1978).

As stressed earlier this does not necessarily mean that nobody died in the radical restructuring of Kampuchean society — far from it. But the allegations of genocide, mass murder or millions of deaths cannot be substantiated, evidence cited all points in the opposite direction. Pol Pot himself answered Richard Dudman, Elizabeth Becker and Malcolm Caldwell in Phnom Penh, "We consider that 95 per cent of the people, both those before liberation and those after liberation on April 17, 1975, are good. Among the other 5 per cent who were hesitating, we were able to successfully re-educate and recover more than 4 per cent, for the latter could re-educate themselves through the actual revolutionary movement. As for the remaining less than 1 per cent, we do our utmost to re-educate them." Ieng Sary himself, as quoted earlier, has stated that about two or three thousand persons died in the evacuation of Phnom Penh and some later working in the countryside.

The government has also stated that several high-ranking officials of the old Lon Nol regime have been executed (former Premier Long Boret, for example). But none of these admissions indicate any widespread or general abuse of human rights, in the generally-accepted sense of the terms.

True Causes of Khmer People's Miseries

It is not, however, sufficient simply to show that the allegations of atrocities, massacres and deaths have been exaggerated and distorted, without offering some explanation as to why such allegations were made in the first place, particularly if the allegations themselves were false. In most accounts, the deaths were said to arise from a number of causes, the most commonly adduced being starvation, lack of proper medical care, the forced and sudden evacuation of Phnom Penh and other cities (such as Battambang), and hard working conditions in the fields after the city populace had been relocated to the countryside. By thus suggesting that these phenomena were the responsibility of the Khmer Rouge, the propagandists carefully concealed the real reasons for starvation, lack of medical care and the evacuation of Phnom Penh. The fact that people had been dying of starvation in alarming numbers and that Cambodian hospitals had been grossly overcrowded and unsanitary long before the liberation of Phnom Penh were carefully omitted.[7]

Long before the liberation of Phnom Penh, the economy of Lon Nol's Cambodia was a total shambles. By the end of 1973, the rice surplus areas of Kompong Thom and Takeo had virtually all fallen into the hands of the National United Front of Kampuchea (NUFK). The total cultivated paddy land dropped from 2.46 million hectares in 1969 to 500,000 hectares in 1974. Destruction of farm machinery and impressment of young males into the army caused a drop in yield on the paddy land remaining under Lon Nol's control. Rice production fell from a total of 3.8 million tons in 1969-70 to a mere 493,000 tons in 197475 — an 87 per cent decline in production. Whereas Cambodia had exported some 230,000 tons of rice in 1968, it was forced to import some 282,000 tons in 1974.

Phnom Penh became slowly flooded with refugees escaping the US bombing. The population of the city increased from a pre-war figure of 600,000 to a probable total of nearly 3 millions (official census figures were never taken during the war but the estimates of various official organisations placed the population at anywhere between 1.2 millions and over 2 million. When evacuating the city the government of Democratic Kampuchea took a census in which they found the total close to 3 millions, according to a later interview with Ieng Sary). The consequent increasingly acute rice shortage sent rice prices up to a staggering height, from 10 riels per kilogramme in December 1971 to 125 riels per kilogramme in December 1973, later to 300 riels and over by early 1975 (mid-February hit a price of 340 riels per kilogramme).

Lack of food can lead to only one result — starvation. An investigation by the Inspector General of the Office of the US Department of State Inspector-General of Foreign Assistance in February 1975 "confirmed the universal medical impression given us by those involved in Cambodia health and nutrition that children are starving to death". Medical evidence was confirmed by journalists' observations; at a small Catholic Relief Services Hospital in Neak Luong, Sydney Schanberg of the *New York Times* described the scene on February 24, 1975:

"The children gathered by the dozen around a Western newsman... Some have swollen bellies. Some are shrunken. A 10-year-old girl has dehydrated to the size of a 4-year-old. Harsh bronchial coughs come from their throats, marking the beginnings of pneumonia and tuberculosis. All have dysentery. Their noses run continuously. Their skins have turned scaly. Every scratch on their legs and arms becomes an ulcer."

The death rate among those few children lucky enough to be admitted to the few functioning clinics was extremely high. At the Red Cross clinic the death rate reached 46 per cent of those admitted in February 1975 alone. Most could never hope to enter a clinic. The World Vision Child Nutrition Center, for example, had to turn away 1,758 severely malnourished children over a two-month period from December 1974 due to lack of beds. The Office of the Inspector-General in the report quoted above noted, "It requires little imagination to picture these wretchedly frail and sickly little bodies, borne away in their weak mothers' arms, carried to an ally somewhere, to die: certain to suffer untreated, unhospitalised, unfed." Dr Gay Alexander, head of Catholic Relief Services, stated in March 1975, "hundreds are dying of malnutrition every day". An eyewitness in Phnom Penh in the same month was quoted in *Newsweek* as saying "thousands of small children, their bellies swollen from hunger, waited for slow death from kwashiorkor and marasmus". It has been estimated from such accounts that there must have been an average of 250 deaths per day from starvation during the closing day of the war; a figure which would give 8,000 deaths for the month of March alone and an estimated minimum of 15,000 for the last 3 months of the war.

According to a study by the Indochina Resource Center, by 1974 an analysis of the total resources used by the Lon Nol regime to remain in control of Phnom Penh and a few outlying enclaves showed that only 2.2 per cent of these came from domestic revenues, while 95.1 per cent came from US assistance. During fiscal years 1971, 1972 and 1973, the United States provided $ 748 millions in assistance to Lon Nol of which only $ 1.1 millions went to assistance to Phnom Penh's refugees (the rest supported either military equipment or military salaries). US Senator Harrison Williams of New Jersey protested in April 1975 that "although warnings were given that large numbers of Cambodian children were beginning to experience malnutrition and that a crisis was emerging, little was done to meet the crisis by either the US government or the Cambodian government" and that in spite of the extraordinary airlift mounted by the US to the beleaguered city of Phnom Penh, the administration had "disregarded the need to move food into the city until forced to [by Congress]". At the same time an Associated Press dispatch of March 5, 1975, stated that the US was airlifting 565 tons of ammunition into Phnom Penh each day!

Medical services in pre-liberation Phnom Penh were also hopelessly inadequate. Of the four major hospitals, Preah Ket Melea hospital was reported to have more than three times the number of patients that it could adequately handle and to be short of antibiotics, sterile dressings, syringes and stethoscopes. Such modern equipment it did have — operating room lights and sterilisation equipment — was rendered unusable by continual power shortages (US Senate Committee on the Judiciary report). The same committee reported as early as 1971 that another major hospital, the Khmer-Sovietique Hospital, had only 512 beds and 27 doctors for 1,009 patients. *Newsweek* reported

an eyewitness to the same hospital in March 1975:

"In the Khmer-Sovietique hospital, more than 1,300 patients struggled for survival last week. Doctors, nurses, medical corpsmen, drugs and plasma were scarce; malaria, tuberculosis and dysentery were rampant. Out of desperation, overworked staffers in some wards tied wounded men to their beds to pervent them from breaking open their wounds and sutures. Flies covered the face of one such patient, who could only shake his head feebly in a vain attempt to keep them from crawling into his mouth."

In his testimony to the US Senate Subcommittee on the Judiciary in January 1975, Dr David French ("Humanitarian Problems in Indochina") describes a visit to one of the hospitals:

"We walked down corridors with stretchers of men with open wounds unattended; filth and detritus, flies and insects and everything there, and there was obviously no medical personnel to meet their needs."

A report of Inspector-general of Foreign Assistance over the same period reads:

"The facilities were not only overcrowded, for the most part they were crude and unsanitary. There was an acute shortage of medicines and drugs. Death frequently resulted from infection and lack of proper care; medication was not being administered to patients suffering severed limbs or gross traumatic abdominal wounds. Little or inadequate antibiotic therapy was being given to patients in need of such therapy... Patients overflowed the wards and were lying on mats or stretchers in the halls and corridors, their unattended wounds exposed to the dirt and filth of aseptic conditions; the stink of pus and infection mingled with the foul odour from clogged, flooded toilets."

Such were the conditions which the Khmer guerillas inherited when they marched into Phnom Penh in April 1975 It was to meet these conditions — to move the city people out to the source of food supplies and in reach of proper medical care offered by clinics already set up in the liberated bases — that the evacuation of Phnom Penh was carried out. It was later alleged that the Khmer Rouge had closed all the hospitals, leaving their patients to die in cold-blooded hatred. This was not true. The only hospital considered fit to take patients, the formerly French-run Calmette hospital was never closed. According to Lawrence. Maurel in his report, "Phnom Penh, L'ambassade en perdition" printed in *Paris-Match* of May 10 1975, ten French doctors who appeared from the hospital to join the other foreigners assembled at the French Embassy compound stated, "We have the impression that they are replacing us with their own doctors and in any case, the hospital is functioning normally". Far from *causing* deaths from starvation and unsanitary conditions, the Khmer revolutionary soldiers must have saved an inestimable number of lives by hastily moving about three million persons to the countryside where both food and adequate medical care were available, away from the deathhole of Phnom Penh.

Restructuring of Khmer Society

Democratic Kampuchea thus inherited starvation and unsanitary health conditions from the previous Lon Nol administration and its US backers; the government of Democratic Kampuchea did *not* create these conditions, but it had to find solutions to them. Moreover, Agence France Presse had reported Lon Nol's Premier, Long Boret as stating on the eve of the surrender of Phnom Penh, that the city had sufficient rice for only eight days. Transporting food to the city of Phnom Penh was impossible. Firstly, as Ieng Sary later pointed out (in an interview in *Chicago Tribune*, September 10, 1975): "We did not have sufficient transportation to move food into the capital." Moreover, there was a shortage of fuel since the new government received virtually no foreign aid and had been reliant on supplies captured from the enemy during the war, after the US supplies of fuel to the Lon Nol regime dried up, the new administration had to trade for fuel across the border in Thailand (according to a report by Sri Lankan journalist, Errol de Silva, who visited Kampuchea in August 1976). Lack of pure water was also a health hazard in the city, the US Inspector-General of Foreign Assistance reported in March 1975 that contaminated water supplies presented "the potential for the spread of epidemics of cholera and typhoid fever" and concluded that "Unsanitary living conditions in Phnom Penh caused by crowding and the influx of refugees into the city create a health hazard and present a danger of epidemics". Although several witnesses later reported that the new administration's soldiers had administered cholera vaccine to the population, there was simply not enough to go round.

But the plan to evacuate the cities was certainly not a new one. Thai military intelligence reports had stressed that the Khmer Rouge were militarily capable of taking Phnom Penh whenever they wished for a couple of years prior to the actual liberation of the city; the fact that the Khmer Rouge did not choose to take the city and thus end the war earlier must have been related to the logistics of supplying the city of Phnom Penh. The Khmer Rouge leaders moreover considered the cities (Phnom Penh and to a lesser extent, Battambang) as a false, outside creations within Cambodia. Life in the cities was a life-style imported from the West; the cities were sort of internal enclaves of Western culture, foreign businesses and diplomats, totally unrelated to the rest of the Cambodian peasant economy; the money-market economy only operated in the cities (the rest of the nation operated on a barter/natural economy). The clear intention to restructure the Cambodian economy — minus its city enclaves of Western culture and domination — had already been expressed in Khieu Samphan's early thesis on "Underdevelopment in Cambodia". But the appalling conditions inherited by the new administration in Phnom Penh added new urgency to implementing the plan. There were doubtless deaths during the evacuation (admitted by Ieng Sary) and disease might well have broken out during the evacuation before people could be got to the clinics in the former liberated country areas; but to blame this on the Khmer Rouge is absurd. Having inherited these foul conditions from Lon Nol and the USA, the Khmer Rouge rather did all they could to alleviate the number of deaths and the toll was much less than might have been expected. Father Englemann has summarised reports received from Catholic priests who were involved in the evacuation as, "During the first days there were deaths: some very ill, some old people, some newly born — but very few. In any event, not thousands, as certain newspapers have written." Since 1972 there had been a comprehensive medical care system set up in the liberated areas consisting of at least one hospital in each province, a fully-trained doctor for each district,

a medical committee for each village and two male nurses with three years medical training for each hamlet. The entire system was under the direction of Dr Thiounn Thioeun, the former Dean of the Medician Faculty at the University of Phnom Penh and ex-director of the Khmer-Sovietique Hospital. It was to get the sick under the care of this superior and already existing medical structure that they, too, were evacuated from the insanitary hospitals of Phnom Penh.

There have also been allegations that the populace of Democratic Kampuchea was forced to labour under severely hard conditions at gun point. As mentioned above, the only photographic evidence adduced to prove this (printed in the *Washington Post*) was so suspect that a generally anti-communist Thai newspaper refused to publish it. Neither do these allegations accord with observations of any of the foreign visitors to Kampuchea. Ito Tadashi, the Kyodo News Service correspondent who visited Cambodia in September last year, quotes working hour figures that tally with the observations of other foreigners; namely an 8-hour working day in both countryside and few factories in the cities, divided into periods of 6 to 11 in the morning and 2 to 5 in the afternoon. He confirms that meals are usually eaten communally in the communes or factories. He also added:

"In our journey of more than 1,000 kilometres across rural Cambodia, the expressions of most of the farmers we saw along the road were bright. One had the impression both that these people had adjusted well to their new environment and that in many ways the leisurely relaxed atmosphere peculiar to rural areas in the tropics had suvived political changes." (*Japan Times*, October 20, 1978.)

Elizabeth Becker also noted in her report in *Newsweek* (January 8, 1979), "We saw no such abuses ourselves... Where are those armed guards oppressing the peasantry?" Caldwell would cry mockingly as we drove past rice fields with no guards in sight."

With regard to the observed working hours and conditions, one might profitably compare them with the situation of day-labourers in Japan in such areas as Kamagasaki. Even when jobs are available, most day labourers leave home at 6 am and do not usually return until after 7 pm (the time taken including work hours, finding a job and transportation time). From their meagre earnings they often have to pay their nightly rent at a "doya" or hotel, as well as tuberculosis (which is not supposed provided for them). There are no adequate health schemes, and diseases such as tuberculosis (which is not supposed to exist in "modern" Japan) are quite high. By such comparisons, it is difficult to view the Kampuchean peasant, working 8 hours per day in the fields, with a 3-hour mid-day break and meals provided on the spot, as a brutally-oppressed labourer. (Health care is, of course, free of charge.) It is perhaps not surprising that those few lower class Cambodian refugees who have come to the West — such as Khuon Sakhon, a former peasant, and Peang Sophi, a worker, in Melbourne, Australia, give a very different picture of working conditions in Democratic Kampuchea. Peang Sophi has stated that working conditions in revolutionary Kampuchea in 1975-76 were less severe than in the Melbourne factory where he now works and Cambodian resident in Australia, Chantou Boua, has stated, "many refugees arriving in Melbourne complained that the normal factory work they began doing was 'harder' than the so-called forced labour they had escaped from in Kampuchea" (unpublished letter to the *Times* dated August 10, 1977 reproduced in *Journal of Contemporary Asia*).

Notes

[A much more detailed book, outlining the falsehoods spread by the Western press about all three Indochinese countries since their liberation is presently being prepared by Noam Chomsky for publication in the USA.]

1 The twisting and turning distortions which the information underwent prior to appearing in the *Christian Science Monitor* editorial were investigated through correspondence with the authors involved by Malcolm Caldwell. Despite the fact that informants at each stage agreed with Caldwell's conclusions, the *Christian Science Monitor* never published any retraction of the extreme conclusions of the editorial. Caldwell's correspondence on the subject was subsequently published in the *Journal of Contemporary Asia*.

2 The precise number of Khmer refugees in Thailand is difficult to ascertain. The UN Commissioner on Refugees has stated on several occasions that there were 170,000 refugees in Thailand from Cambodia and Laos. For the number of Cambodian refugees the Agence France Presse has estimated them to be between 30 and 50,000. However, Thai Communist party publications early this year claimed that the number of Khmer refugees may be as low as only 10,000. Whichever figure is accepted for the number of Khmer refugees, it is in any case extremely small, a fact which in itself should be a cause for serious reflection.

Both the Thai government and the UN Commissioner for Refugees have frequently stated that the number of Laotian refugees in Thailand is "over 120,000". For both Laos and Cambodia, Thailand represents the only land exit route for refugees and it may be pertinent to wonder why there should be more than 120,000 refugees from Laos with a population of around a mere 3 millions, whereas for Kampuchea — with a much greater population of nearly 8 millions — there are, taking a larger estimate, only about 40,000!

These figures alone would suggest that conditions in Laos should be carefully scrutinised — rather than those in Kampuchea! It is rather difficult to establish the accuracy of information pertaining to Laotain conditions. Suffice it to say that Thai Communist party sources have claimed early this year that since Laos and Viet Nam signed a 25-year "Treaty of Friendship and Co-operation" in July 1977, as many as one million Vietnamese have immigrated to Laos as settlers. It is also claimed that Viet Nam has as many as 40 or 50,000 troops permanently stationed in Laos. If true, the unavoidable implication is that almost a quarter of Laos' population is now Vietnamese and, whatever justifiable reasons there may have been for this migration, it does appear reminiscent of an extreme form of "assimilation" policy and casts considerable doubt on Viet Nam's motives in establishing an "Indochina Federation". The present Laotian premier, Khaysone Phomvihane, is half-Vietnamese. That all is not well in Laos was indicated by the flight in late March this year of Laotian Deputy Premier, Phoumi Vongvichit, across the Mekong to Thailand. He appeared to be making his way to China, but apparently agreed to return to Laos after meeting with representatives of Khaysone in Hong Kong. The full details behind the incident are not yet known. Nevertheless, it must be a cause for reflection that Phoumi, a staunch Laotian liberation fighter during the war, should have come to contemplate such a course of action.

3 The incident was fully reported in a February 1978 issue of the Thai language *Athit* (Sun) magazine. The same magazine in March also suggested that the former Thai ambassador to (Lon Nol's) Phnom Penh, Chanat Samutwanich, had

been in [illegible] in activities. In the [illegible], a [illegible] in *Athit*, Chanat stated that, as ex-Ambassador, many refugees who had been his former friends in Phnom Penh came to seek humanitarian aid from him. He added that he had been pressured by several high figures in the Thai military to assist the refugees, clearly indicating that the refugees were receiving political assistance from high Thai quarters. Nevertheless in a subsequent interview in the *Matichon* magazine (March 12, 1979), Chanat stated that in order to get rice and fish (from Tonglesap) the Vietnamese "are forcing the Khmer peasants to work much, much harder than under the former Pol Pot government".

4 According to the February 1978 *Athit* article quoted above, Kittivutho is running military training programmes for the Khmer refugees from Wat Jittapawan Temple in Chonburi Province, East of Bangkok.

5 *Athit* demonstrated in its early 1978 issues that the refugee reports of atrocities reached their height under the Thanin government. It noted that both atrocity reports and border incidents dramatically declined after Kriangsak took power in October 1977 as the new government was intent on improving relations with Indochina. The magazine concluded that, as the reports and their tone varied in quality and quantity according to the attitudes of the governments in power in Bangkok, they reflected only the current attitudes of the Bangkok administration, and not the objective situation pertaining in Kampuchea under Pol Pot. Shortly after these statements, *Athit* reported that it had been instructed by General Prem, Deputy Assistant Commander-in-Chief of the Thai army, to cease from publishing any further information on the Khmer refugees in Thailand.

6 Vietnamese government sources have been the most common source of atrocity stories. It is interesting to note that the Soviet Union initially attacked the atrocity reports and human rights allegations about Kampuchea. As Soviet relations with Viet Nam deepened, the tenor of Soviet reports was toned down, until, after the signing of the Soviet Viet Nam Treaty last December, the Soviet Union accomplished a propaganda about-face and added its voice to those condemning Pol Pot for atrocities and violations of human rights.

7 The details which follow on the growth of starvation in Phnom Penh, the breakdwn of medical services and the evacuation of the cities are largely taken from the first two chapters of "Cambodia: Starvation and Revolution" by George C Hildebrand and Gareth Porter (Monthly Review Press, 1976). Limitations of space have not permitted the translation in full of these two excellently documented chapters. To save space, also, a number of the original references have had to be omitted. Readers wishing to check source references will easily find them in the long section of footnotes at the end of the original book.

Demand for Total Ban on Cow Slaughter in Kerala and West Bengal

Some Observations

K N Raj

Vinoba Bhave's demand for banning cow slaughter in Kerala and West Bengal and his fast for gaining its acceptance raise three sets of issues; (a) the constitutional and legal basis of the demand, (b) its economic rationale, and (c) the political implications and possible consequences. This note examines these issues.

VINOBA BHAVE'S demand for total banning of cow slaughter in Kerala and West Bengal, and his fast-unto-death for gaining its acceptance, raise three sets of issues which we need to understand very clearly. They are (a) the constitutional and legal basis of the demand, (b) its economic rationale, and (c) the political implications and the possible consequences.

The constitutional basis of the demand is Article 48 of the Indian Constitution, and the legal sanction claimed is from a Supreme Court judgment on cow slaughter delivered in April 1958. Let us therefore consider first what each of these says and what follows from it.

Article 48 of the Constitution is quite explicit on the question. "The State", it says, "shall endeavour to organise agriculture and animal husbandry on modern and scientific lines and shall, in particular, take steps for preserving and improving the breeds, and prohibiting the slaughter of cows and calves and other milch and draught cattle". This is in fact one of the Directive Principles of State Policy, which have been laid down as "fundamental" in the governance of the country".

The Directive Principles are however not enforceable by any court, and are only a broad guide to policy. They are to be applied in making laws, and it is these laws alone that can be appealed to or challenged in courts of law. Moreover, if the laws so framed are challenged, the courts are free to interpret the relevant Directive Principle and decide wheher or not the laws are in conformity with it and the other provisions of the Constitution.

In fact this is what makes the Supreme Court judgment of 1958 so important in this context. The Government of Uttar Pradesh had enacted legislation in 1955 imposing a total ban on cow slaughter, but only on the slaughter of "the cow and its progeny"; while a law passed by the Bihar Legislature a year later imposed a total ban on the slaughter of all categories of bovine cattle including buffaloes. On the face of it one would think that the Bihar legislation carried out the intention of the Directive Principle more fully, as Article 48 covered not only cows and calves but other milch and draught cattle as well. And yet the Supreme Court thought otherwise, and struck down the portions of the Bihar law which prohibited the slaughter of she-buffaloes, breeding bulls and working bullocks (both cattle and buffalo); it upheld in full the constitutional validity of only the Uttar Pradesh legislation. We need to understand the grounds on which the Supreme Court arrived at these decisions, particularly because they pro-

has a logical framework and some important criteria for judging whether demands such as those that are being made by Vinoba Bhave in the name of the Supreme Court are well founded or not.

In the first place, the judgment of the Supreme Court takes the position that, though there are three directives incorporated in Article 48, "the two last directives for preserving and improving the breeds and for the prohibition of slaughter of certain specified animals represent, as is indicated by the words 'in particular', two special aspects of the preceding general directive for organising agriculture and animal husbandry on modern and scientific lines". This implies that whatever steps are taken in pursuance of the directive for prohibiting such slaughter should be at least consistent with the development of agriculture and animal husbandry on a modern and scientific basis.

The second important premise in the reasoning of the Supreme Court in this case is that the Directive Principles of State Policy have to conform to and run as subsidiary to the fundamental rights of the citizens under the Constitution; and that any legislation which imposes restrictions on these rights can be constitutionally valid only if it can be adjudged as "reasonable" restrictions "in the interests of the general public". This is for the judiciary to decide, not on the basis of any abstract standard of reasonableness but taking into account all the circumstances of a given case. "... it is inevitable", observes the Court in this context reiterating one of its earlier judgments "that the social philosophy and the scale of values of the judges participating in the decision should play an important part, and the limit to their interference with legislative judgment in such cases can only be dictated by their sense of responsibility and self-restraint and the sobering reflection that the Constitution is meant not only for people of their way of thinking but for all, and that the majority of the elected representatives of the people have, in authorising the imposition of the restriction, considered them to be reasonable".

It is on these two important premises that the Court went on to consider the legislation on cattle slaughter which had been challenged. The Court's examination of the relevant facts in this light led to its ruling that the protection recommended by Article 48 was confined only to "cows and calves and to those animals which are *presently* or *potentially* capable of yielding milk or of doing work as draught cattle but does not, from the very nature of the purpose for which it is obviously recommended, extend to cattle which at one time were milch or draught cattle but which have ceased to be such".

It is in fact significant that in this context the Supreme Court took a categorical stand against total banning of cattle slaughter, both on the ground that it would lead to waste of national resources and for the reason that it would deprive many people of their staple food and means of livelihood. Since this has not been brought out clearly enough in the recent discussions on cow slaughter, an extract from the Supreme Court's judgment may serve a useful purpose:

> If the nation is to maintain itself in health and nourishment and get adequate food, our cattle must be improved. In order to achieve this objective our cattle population fit for breeding and work must be properly fed and whatever cattle food is now at our disposal and whatever more we can produce must be made available to the useful cattle which are *in presenti* or will *in futuro* be capable of yielding milk or doing work. The maintenance of useless cattle involves a wasteful drain on the nation's cattle feed. To maintain them is to deprive the useful of the much needed nourishment. The presence of so many useless animals tends to deteriorate the breed. Total ban on the slaughter of cattle, useful or otherwise, is calculated to bring about a serious dislocation, though not a complete stoppage, of the business of a considerable section of the people who are by occupation butchers, hide merchants and so on. Such a ban will also deprive a large section of the people of what may be their staple food. At any rate, they will have to forego the little protein food which may be within their means to take once or twice in a week. Preservation of useless cattle by establishment of Gosadans is not... a practical proposition. Preservation of these useless animals by sending them to concentration camps to fend for themselves is to leave them to a process of slow death and does them no good. On the contrary, it hurts the best interests of the nation in that the useless cattle deprive the useful ones of a good part of the cattle feed, deteriorate the breed and eventually affect the production of milk and breeding bulls and working bullocks, besides involving an enormous expense which could be better utilised for more urgent national needs.

Since the legislation enacted in Bihar prohibited the [illegible] cattle, the Court [illegible] strike down part of its provisions as invalid.

The only question that remains is why the Supreme Court considered a total ban on the slaughter of cows of all ages, imposed in Uttar Pradesh, as a reasonable restriction when, according to its own interpretation, the protection offered by Article 48 was to cover only those which are presently or potentially capable of yielding milk. We need to understand this very clearly, because it is on the basis of this decision that Vinoba Bhave is now demanding a total ban on cow slaughter in West Bengal and Kerala.

A careful reading of the judgment of the Supreme Court makes it obvious that the special exemption it gave to the cow in this regard was not because it was thought to be a good milch animal but for exactly the opposite reason. "If milk yielding capacity were the only consideration", observed the Court, "the comparatively smaller number of female buffaloes which produce 54 per cent of the total milk supply of our country would obviously have deserved a far greater preference over the cows in our estimation". The more important consideration in its view was that bullocks were required for agricultural purposes, and cows were needed for producing bullocks. But the yield of milk from cows being much lower than of she-buffaloes there was a tendency to get rid of them by sending them to the slaughter house. "The danger of such premature slaughter is greater for the cow, for being an animal with a scanty yield of milk it does not pay the owner to maintain her through the long dry period and hence there is an inducement for adopting even cruel practices to get her passed by the inspectors [of slaughter houses]". Consequently, "regulation of slaughter of animals above a specified age may not be quite adequate protection for the cow", though it may be quite sufficient for breeding bulls and working bullocks and the she-buffaloes which are highly valued by their owners. It is these considerations, concludes the Court, which have "induced us to make an exception even in favour of the old and decrepit cows".

It is also evident that all that the Supreme Court did in this cases was to extend to the Uttar Pradesh legislation, when it was challenged, the benefit of such concessions as could be given to it by interpreting its rationale as sympathetically as possible.

This was therefore to be understood in the light of an earlier observation of the Court in its judgment that "there is always a presumption in favour of the constitutionality of an enactment" and that the courts "must presume that the Legislature understands and correctly appreciates the needs of its own people".

There is therefore no warrant at all for the position taken by Acharya Vinoba Bhave that, since the total ban on cow slaughter imposed in Uttar Pradesh was declared valid by the Supreme Court, it is now in some way obligatory for other states such as Kerala to introduce identical legislation. It is clear from the reasoning underlying the judgment of the Supreme Court that it is upto the Kerala legislature to enact such laws as it considers essential to meet the needs of the people in Kerala; and that, if it were to decide in favour of regulating the slaughter of only particular categories of animals falling in specified age-groups, it would be more in line with the constitutional requirements than the Uttar Pradesh legislation for which the Supreme Court had to go out of its way and make an exception.

If this is an incorrect interpretation — though there is no obvious reason to think so — it is upto Vinoba Bhave and his followers to take the matter to the Supreme Court in an appropriate way and test the correctness of their own position. That they do not take this obvious course, but have decided instead to use coercion of all kinds, for which there is neither legal nor moral justification, is a sad reflection on their understanding of their own obligations in a democratic society governed by the rule of law and in which all are supposed to have equal rights.

Let me now turn to the purely economic aspects of a total ban on cow slaughter. Since the judgment of the Supreme Court has itself touched on the most important aspects that have to be borne in mind, it is not necessary to cover that ground again. I shall therefore confine my observations to a few considerations which are particularly relevant in the context of Kerala.

In the first place, the pressure of population on land is very much greater in Kerala than in the rest of India. For this reason the total bovine population maintained in Kerala has always been much lower, as a proportion of the total human population than in other parts of India; as the human population grows, the need for restricting cattle population (on the grounds mentioned in the Supreme Court judgment) is also much greater.

Secondly, unlike in the rest of India, there has been no pronounced tendency in Kerala to favour the she-buffalo at the expense of the cow (which, as we have noticed, was an important consideration in the Supreme Court's judgment relating to cow slaughter). In fact, what is most striking is the sharp contrast in this respect between Kerala and Uttar Pradesh where the cow is supposed to be held in the highest veneration.

Though male and female cattle are born nearly equal in number (as one would expect), the number of female cattle above the age of 3 years is below half the number of male cattle in the same age-group in Uttar Pradesh. This is the case even in districts such as Allahabad, Varanasi and Gorakhpur where Muslims account for only about one-tenth of the population. The explanation for this has been given very clearly in the Supreme Court judgment of 1958:

> ... despite all the veneration professed for the cow, when it comes to the question of feeding, the she-buffalo always receives favoured treatment and the cow has to be satisfied with whatever remains after feeding the she-buffaloes, bullocks, and calves in order of priority... the professional gowalas, who are mostly, if not wholly, Hindus, find it uneconomical to maintain the cow after she goes dry and consequently sell her to the butcher for slaughter at Rs 30 to Rs 50 per head, irrespective of her age and potential productivity...

In Kerala, on the other hand, it is the male animal (with which Vinoba Bhave is not concerned) that has been primarily singled out for such treatment, mainly for the reason that the garden lands of this state do not require ploughing and field cultivation is not so extensive as in the Indo-Gangetic Valley. Nor is there any strong preference for milk of she-buffaloes, presumably because the fat content is considered too high in the almost uniformly hot and humid climate of the state. Consequently, the cow receives preferential treatment, and there are in Kerala more than three times as many adult female cattle (above the age of three) as adult male cattle.

The absurdity of asking Kerala to follow the example of Uttar Pradesh becomes still more obvious when we consider the trends in the number of cows and she-buffaloes maintained for breeding and milk production in the two states. In Uttar Pradesh, despite the total ban on cow slaughter, not only has there been no change in the sex-ratio in favour of cows over the last two decades but the total number of cows maintained for breeding and milk production has remained almost

unchanged at about 6.75 million; at the same time, the number of she-buffaloes maintained for these purposes has been steadily rising and is now larger than the number of cows. In Kerala, on the other hand, the increase in the number of she-buffaloes maintained for breeding and milk production has been negligible (from 0.14 to 0.16 milion), while the number of cows maintained for these purposes has risen significantly from 1.1 million in 1961 to nearly 1.4 million in 1977, an increase of over 20 per cent. In fact, nearly 90 per cent of the milk output of Kerala is from cows.

Further, the breeding efficiency of the cows in Kerala (defined as the ratio of the number of calves born annually to the total number of the adult female cattle) has not only been higher but has also been rising. In 1961, it was 0.48 in Kerala compared to 0.40 in Uttar Pradesh; by 1977 it was 0.60 in Kerala, while the data available for Uttar Pradesh upto 1972 indicate that there was hardly any improvement there.

Moreover, as has been brought out in a study by K Narayanan Nair ("Milk Production in Kerala: Trends and Prodepects", *Economic Political Weekly*, Review of Agriculture, March 1979) here has been a significant increase both in the total output of milk in Kerala and in the average milk yield of cows. This has been made possible to a considerable extent by selective culling of cows and the more efficient use of cattle feed among the rest. The increased availability of milk in the state has in turn helped to offset in part the reduced per capita availability of fish for internal consumption, and thus meet the minimum necessary protein requirements of the people. Beef also makes an important contribution to these requirements.

These and many more such highly relevant facts are available to those who are interested in them. In 1958, when the Supreme Court gave its ruling on cow slaughter, hardly anyone had made an intensive study of the economics of cattle, so much that the Court had to rely largely on its resources. The only expert advice it received from outside was from a gentleman by the name of Pandit Thakurdas Bhargava who acted as *amicus curiae* (i e, friend of the court) at the instance of one of the all-India movements for the protection of the cow. The dilemma in which the Court found itself, and the special considerations on which Pandit Bhargava was accepted in this role, will be evident from the following extract from the Court's judgment:

> Under O.XLI, R. 2. Supreme Court Rules, intervention is permitted only to the Attorney General of India or the Attorney General for the States. There is no other express provision for permitting a third party to intervene in the proceedings before this Court. In practice, however, this Court, in exercise of its inherent powers, allows a third party to intervene when such third party is a party to some proceedings in this Court or in the High Courts where the same or similar questions are in issue, for the decision of this Court will conclude the case of that party. In the present case, however, the petitioners for intervention are not parties to any proceedings and we did not think it right to permit them formally to intervene in these proceedings; but in view of the importance of the questions involved in these proceedings we have heard Pandit Thakurdas Bhargava, who was instructed by one of these petitioners for intervention, as *amicus curiae*.

The Supreme Court need not be in such a predicament if the matter comes up again before it. Several scholars, like V M Dandekar and S N Mishra among others, have gone into these issues in some detail and the results are available in the form of a number of research papers. These papers can help in understanding the economic issues involved in somewhat greater depth than was possible two decades ago. No one can of course claim that all the issues are fully clarified by the work that has been done so far or that the findings cannot be disputed. All one can say is that, for anyone seriously interested in these issues, there is now enough empirical evidence on which discussion is possible on a systematic basis.

Unfortunately it is such rational discussion that is ruled out by the method adopted by Vinoba Bhave and his followers for gaining acceptance of their point of view. It has been reported that, when the Chief Ministers of Kerala and West Bengal requested him earlier this week to postpone his fast by a year, during which period they could have the matter considered further by discussion among the people, Vinoba Bhave was prepared to give them only three days for doing so. All this reflects a kind of moral, intellectual and political authoritarianism which those of us who believe in democratic processes cannot possibly accept. For this reason it is no longer an academic issue, and we need to consider, as ordinary citizens of India, the political implications of the stand taken by Vinoba Bhave and its possible consequences.

If Vinoba Bhave does not himself see this dimension of his wholly misplaced zeal it is understandable, since he was also in favour of the Emergency and give it his full moral support in the name of "Anusashan". But those of us who have experienced what such high-minded slogans can lead to cannot afford to be indifferent to the far-reaching implications of what he is doing now. His fast and the satyagraha movement that is being launched along with it, we are told, will bring in large numbers of volunteers from outside the state to press for a total ban on cow slaughter. Not only does all this constitute a serious threat to our fundamental rights as citizens of India and of this state but it creates the possibility of serious communal and other tensions being created both inadvertently and deliberately. After all though Vinoba Bhave appeals to the Directive Principles of the Constitution and to the Supreme Court judgment, his plea, when he addresses common people, is more direct: "The cow is our mother, killing the cow is killing our mither." Such ill-disguised appeals to religious sentiments can obviously have very serious consequences. There are also many forces in our country which would welcome such developments.

If they are not to have their way it is important that we make clear to the people of Kerala, and of the rest of India, what the issues involved in cow protection really are and what the facts are. It is on mass ignorance that movements such as the one launched by Vinoba Bhave usually thrive. To dispel ignorance is therefore the main task before all of us who believe in a more enlightened approach to social and political problems.

Indian Explosives

INDIAN EXPLOSIVES is celebrating its 25th year this year. Coincidentally, in February last, it received a licence to expand fertiliser production by 50 per cent at Panki in UP. This Rs 80 crores investment will lead to an annual output of urea which will help produce an additional 3 million tonnes of foodgrains every year. With the completion of this expansion by 1981, IEL's Panki unit will become India's largest urea plant. In the year ended September 1978, the fertiliser division recorded production of 4,02,000 tonnes which represented 90 per cent capacity utilisation.

Masterpieces inspired by Indian dyes

Adroit-1614

MADHUBANI

Paintings in the characteristic Madhubani style are today much sought after all over the world Loose-limbed, exaggeratedly vertical figures, almost naively drawn, but nevertheless with a reserve of strength in their forms dominate the compositions Foliage and flower are stylized and elaborated into extended decorative patterns

In Madhuban and its neighbouring villages in the southeast of India, this style of painting was used traditionally for murals on the outside of huts Today the designs are being adapted on fabric and paper

The Madhubani murals were executed only by women who obtained all the colours used from natural sources Sensuous scarlet and deep sienna from the Kusum blossom bright yellow from turmeric soft gold from a compound of banana leaf juice, milk and lime rich black from encaptured smoke, these were then mixed with goat s milk and Bakul tree gum as binding media.

Indian dyes have come a long way since then

Today Atul Products produces a wide range of Synthetic Dyes which help colour everything from fabrics of cotton, jute, wool, art-silk, and man-made fibre, to leather and paper.

Atul also produces Dye Intermediates to help make Synthetic Dyes, and Optical Whitening Agents which make whites look whiter.

Wherever there is colour, there is a dye Atul makes some of the finest man-made dyes.

PLAYING POLITICS WITH THE ECONOMY

Who would recognise her today?

She has grown up beyond recognition. And yet to those who are nearest to her, the change has been so imperceptible that often they tend to treat her still as their favourite baby. And does she mind it!!

To most housewives in India, Hindustan Lever is the supplier of well-known products—Sunlight, Dalda, Lux, Lifebuoy and a host of others. But this company has grown and changed especially in the last five years—so much, that we thought we should tell you something about it.

Do you know that about 60% of our total investments in fixed assets today are in projects in the core sector or sophisticated technology? That we have an investment of nearly Rs. 3 crores and a recurring expenditure of about Rs. 1.5 crores per annum in the largest private sector R & D Centre in India? That over 50% of all our managers are scientists and technologists?

A company goes the way its capital is invested and its management chooses the direction. Our direction is clear: technology-intensive sectors of national priority.

Next time you see her, please remember she has grown and is changing.

... rops

PRICE support purchases of rice in the 1978-79 kharif season were nearly 20 per cent larger than in the previous season; the offtake of rice from the public distribution system, however, declined from 4.7 million tonnes in 1977 to 3.2 million tonnes in 1978; as a result, surplus stocks of rice with the government agencies have assumed embarrassing proportions. Nevertheless, the Agricultural Prices Commission (APC) has once again recommended an increase of Rs 5 per quintal, from Rs 85 to Rs 90, in the support price (the expression 'procurement price' has long since become a misnomer) of rice for the 1979-80 kharif season. Only a month ago, accepting the APC's recommendation, the government had raised the support price of wheat from Rs 112.50 to Rs 115 per quintal. Subsequently, it has sought to offer still higher prices to wheat farmers who, instead of selling their output at the start of the marketing season, bring it to the market later — a dual price arrangement favouring the big farmers who are the ones able to hold on to their stocks the longest.

The government has claimed the recent rise in production of rice as one of its achievement. Actually, the rise in production itself has been quite modest. Thus, according to the APC, production of rice increased by no more than 17 per cent, from an annual average of 40.8 million tonnes during the three-year period ending 1970-71 to 47.8 million tonnes during the triennium ending 1977-78. What is striking, however, is the distribution of this increase. Out of the additional production of about 7 million tonnes over the period, as much as 3 million tonnes, or 42 per cent, came from Punjab, Haryana and Uttar Pradesh, and only 0.8 million tonnes and 0.5 million tonnes, respectively, from the traditional rice growing and rice eating states of Andhra Pradesh and Tamil Nadu. The difficulties currently facing the government's price support machinery are a consequence of this. Thus procurement of rice has had to go up from 4.4 million tonnes in 1976-77 to 5.7 million tonnes in 1978-79 and, what is more, the share of Punjab, Haryana and UP in total procurement of rice, which at 65 per cent in 1976-77 was already very high in relation to share of these states in the total output of rice, went up further to 76 per cent in 1978-79. These figures not merely speak of skewed regional distribution of the increases in production but also suggest their concentration in the hands of farmers producing largely or exclusively for the market.

On the other hand, circumstantial evidence is equally suggestive of the public distribution system for foodgrains leaving outside its coverage the poorest sections of the population, especially the rural population. How else can one explain the sluggish offtake of wheat from the public distribution system at the official issue price of Rs 130-134 per quintal at a time when the open market prices are, as the managing director of the Food Corporation of India recently pointed out, Rs 160-180 per quintal. Clearly, a substantial proportion of the population which falls within the ambit of the public distribution system has the means to forgo the wheat offered by the fair price shops in favour of higher-priced, presumably better quality, supplies from the open market. The relatively sharper fall in the offtake of rice suggests the same, since quality preferences are stronger in the case of rice. Essentially, the public distribution system in foodgrains, which is kept going at the cost of a budgetary subsidy of over Rs 500 crores annually, serves the purpose of making available foodgrains at relatively stable prices to the industrial working class and the white collar workers and thus keeping down the wage costs of organised industry and business.

Given the government's preoccupation with operating a price support system which benefits essentially the larger farmers (and is being made to serve that objective even more explicitly with innovations such as the latest dual price system for wheat referred to above) and with a public distribution system whose *raison d'etre* is to keep urban discontent under check and protect organised industry and business from wage demands which might be engendered by rise in prices of foodgrains, there is little inclination to spare a thought as to why it should happen that altogether modest increases in production — the Fifth Plan target for foodgrains production in 1978-79, let it be remembered, was 140 million tonnes compared to the 125 million tonnes or so likely to have been actually achieved — should present such agonising problems of price support in a country where roughly half the population does not get enough food to eat. The answer to the puzzle has to be sought in the kind of facts which have been brought to light, for instance, by Rural Labour Enquiry, 1974-75, conducted by the Labour

[illegible] Labour Ministry.

The Enquiry found that between 1964-65 and 1974-75 the number of agricultural labour households had gone up by 35 per cent compared to a rise of 17 per cent in the number of all rural households. Further, among agricultural labour households, the number of those with land went up sharply by 52 per cent and their proportion to total agricultural labour households rose from 44 per cent to 49 per cent. Clearly, a large number of small peasants who, according to conventional wisdom, should have prospered as a result of the supposedly 'scale-neutral' new agricultural technology, had got pushed down into the ranks of agricultural labourers. Further, with the rapid expansion of the agricultural labour population, the average number of wage employment available to members of agricultural labour households declined as did the average daily real earnings, after correcting money earnings for the price rise over the decade. It is this other side of the type of agricultural growth that we have had which is responsible for creating the seemingly intractable problems providing price support to agricultural products and which is driving the government in ludicrous directions like looking for openings for export of foodgrains. The APC has in its latest report busied itself with recommendations for expanding storage facilities and matters of that kind, but the problem is part of the whole structure of the agricultural economy.

International Relations

Competition and Accommodation

SALT II, agreement on which has been reached after over six years of negotiations, is now expected to be signed next month. There is much speculation about the opposition the agreement might meet with in the United States where the Senate has to endorse it with a two-thirds majority for it to become effective. But it is most unlikely that the agreement will not be finally endorsed by the US Senate. Big powers like the United States do not enter into elaborate agreements with equally big powers like the Soviet Union without the leaders being quite certain that they will be able to carry legislative support to their undertakings. As for the fears expressed in the US that with the loss of the monitoring facilities that the US enjoyed till recently in Iran, monitoring of Soviet strategic programmes would be difficult, the highest authorities in the US have reiterat[illegible] manded more [illegible] attention during SALT II negotiations than the ensuring that the agreement would be fully verifiable. In the words of President Carter, "For many years we have monitored Soviet strategic forces and Soviet compliance with SALT I agreement with a high degree of confidence. The overall capability remains. It was certainly not lost with our observation stations in Iran, which was only one of many intelligence sources we use for following Soviet strategic activities."

Enough has been reported about the provisions of SALT II to make it clear that the proposed agreement does not in the least affect the awesome destructive capabilities of either of the contracting parties. In fact, what both the parties are anxious to achieve is some control over the quite unnecessary expenditures that would be inevitable (under the pressure of the respective military establishments) if some halt is not called to the meaningless multiplication of existing destructive capabilities. At the same time, the proposed agreement, even while it lays down very specific limitations on the number and deployment of missiles, warheads, etc, also allows freedom to each side to develop one entirely new 'military system' during the life of the Treaty (the Treaty is to expire on the last day of 1985); that is, the agreed ban on the testing and deploying of new types of ICBMs is qualified with "one exemption for each side". Thus, even as quite sensible and economically sound limitations are being agreed upon over the redundant proliferation of mutually known military facilities, both the parties are also left free to develop further sophisticated military systems whose aim would only be to further refine the existing balance of terror.

Leaving aside these details of the agreement (whose final text is yet to be published), what does the agreement portend for big power relations and for the rest of the world which is not directly a party to it?

Carter himself has acknowledged that "because our values are so different, it is clear that the United States and the Soviet Union will be in competition for as far ahead as we can see". But this 'competition', while being confined to the peaceful variety in areas which are generally assumed and acknowledged to be of each other's spheres of interest, might take bloodier forms in such areas as Indo-China, Africa, South and West Asia. In other words, SALT II is part of a series of accommodations entered [illegible] last de[illegible] which the balance of terror is to be maintained and further refined, but also have many safety clauses built into it to ensure that the citizens of the countries of the contracting parties and of those states geographically, culturally and economically peripheral to them will never be faced with the kind of devastation that overtook Europe in the Second World War.

Waging a conventional war in Europe is to invite suicide for the countries of both the Warsaw Pact and NATO. The political and economic conditions in these regions also make them quite unsuitable for any kind of unconventional war, barring situations when these are under foreign occupation — a possibility which might arise only after a conventional war. But the vast regions in Africa and Asia are still fresh pastures; and it is there that 'competition', in whatever form it is proposed to be entered into, is going to take place.

Jute

Collusion with Trade and Industry

THE Committee on Public Undertakings of the Sixth Lok Sabha, whose earlier reports on matters relating to jute (the third, the eighth, the twelfth, the thirteenth, the fourteenth and the sixteenth reports) have already highlighted the wretched conditions of the jute growers as also the various economic offences committed by the trade and industry and the many instances of tacit and active connivance at these offences by the Jute Corporation of India (JCI) which is supposed to look after the interests of the growers, has now published three more reports, two of which deal with 'action taken' on the findings of its own earlier findings in the third and eighth reports referred to above and the third, the 25th report, which continues the saga of the JCI and its continued failure to function as an agency primarily intended to ensure that a fair return is ensured to the jute growers.

The poor performance by the JCI, particularly with regard to properly publicising its own activities among the growers, and its persistently late entry into the jute market well after the grower had been forced to sell his produce to private traders (a point which had been highlighted in earlier reports of the COPU too) is indictment enough; but the 25th report also

[illegible] out the continuing close links between the JCI and private trade, suggesting that many of these lapses by the JCI might not have been involuntary after all. Instances are cited of the officials of the JCI actually conniving with private trade in cheating the poor grower by employing such time-honoured devices as downgrading the quality of jute offered for sale and underweighing. There is also a fairly detailed account of many shady deals with trade and industry, including the appointment of two private firms (controlled by two brothers) of Calcutta as JCI agents for purchase of jute at Parvathipuram in Andhra Pradesh. The report also cites many instances where JCI appointed buyers colluded with private traders by preparing bogus cash memos in the names of different 'farmers' in order to show that jute has been actually purchased from the growers. The JCI-appointed private firms buying jute in Parvathipuram, for instance, produced receipts in one case to show that 198 growers in 21 villages had sold jute to the JCI, only for the COPU to discover that 186 of these 198 did not exist at all, and the remaining 12 growers denied ever selling jute to either of the two agents.

Another serious malpractice uncovered by this report relates to the extraordinary concessions shown by the JCI to sundry jute mills. The five cases involving six firms cited by the Report all have such common features as selling of jute at rates lower than those at which it is supplied to other mills, ignoring such normal requirements as that the purchasing party should open a proper letter of credit in time, that such a letter of credit should be irrevocable (in one instance, the report notes that the terms and conditions of a letter of credit as sent to the JCI by the bank differ from the terms and conditions of the letter of credit in the records of the bank!), reneging on the payment of dues on agreed instalments, and continued supply of jute even when a mill had failed to keep up the payment schedule. The report also goes into certain financial irregularities, including the JCI's odd practice of not depositing cheques promptly, or of accepting post-dated cheques clearly with a view to further accommodating the jute mills.

But what actually happens to the painstaking deliberations of the COPU can be seen in the two quite depressing documents produced by the same committee in the form of an [illegible] Report (which is about action taken by government on the COPU findings in its Eighth Report) and the 33rd report (which is about action taken by government on the COPU's Third Report). The latter is a relatively less depressing document in that the findings of the original Report — that the JCI enters much too late into the market to be of any good to the grower; that the price of jute continues to be manipulated by private traders and industry; that the elaborate system of grading jute makes possible extensive malpractices and leads to the defrauding of growers; that the facilities of institutional credit, available in such ample and easy measure to industry, is not at all available to the grower — as well as the recommendations to rectify these wrongs are all more or less 'accepted in principle' by government.

The other 'action taken' Report relates to the recommendations of the Eighth Report of the COPU that the minimum price for raw jute be raised to Rs 447.64 per quintal (that is, the cost of producing a quintal of jute as computed by the West Bengal government in 1977-78 at Rs 334.34 plus a return of 30 per cent to the growers). The controversies raging over this recommendation are well known, and the report itself recounts all the issues involved, the different set of criteria adopted by the agricultural department of the government of West Bengal and the standing technical committees on indices of input costs of the Union Ministry of Agriculture. Nothing seems to have moved the Union government to even consider the recommendations of the COPU. In fact, the whole of Chapter IV of the Report, which again sets out the recommendations made in the Third Report of the COPU on jute prices and the replies received thereof from Government of India (which, the COPU for its part, says "have not been accepted by the Committee", though it is difficult to see what the COPU can actually do about it except reiterate its recommendations) and which occupies the major part of this 'action taken' Report presents a most instructive instance of stonewalling by government; the impression one gathers is of endless repetitions of counterarguments and set answers. The whole exercise is no doubt a tribute to the persistence of those hard-working members and staff of the COPU and, particularly, its Chairman; but in practical terms, barring the fact that these reports provide material for further investigations into the misery of the jute growers and their impossibly wretched state, little by way of actually alleviating their distressing conditions seems to have been achieved by these exercises.

Politics

Parvathipuram Conspiracy Case

Mohan Ram writes:

IT was just a coincidence that the CPI had just observed the 50th anniversary of the Meerut Conspiracy Case when the curtain was rung down on the marathon Parvathipuram Conspiracy Case relating to the Srikakulam peasant struggle of 1969-70. It is not quite the end because the division bench, which rejected the state's appeal against the acquittal of 50 of the accused, acquitted only Kanu Sanyal and 11 others but was divided on the sentence passed on five others (including Choudhury Tejeswara Rao) and has referred this specific issue to a third judge.

The British colonial rulers had tried to strangle the infant Indian communist movement by instituting a string of conspiracy cases even before the formal launching of the Communist Party of India in 1925. The Peshawar and the Cawnpore cases were the more prominent among them. The Meerut conspiracy case was instituted in 1929. More recently the government of Andhra Pradesh has continued the use of this colonial method to hold the leadership of the Naxalite movement on a short leash. The process began with the arrest of almost the entire leadership of the then Andhra Pradesh Revolutionary Committee at the end of 1969 when it was holding a conclave in Madras and the institution of conspiracy charges against those arrested. The result was imprisonment of upto four years for the more prominent leaders before they came out on bail pending appeal. When the Emergency was declared, they went underground. The appeal was disposed of during the Emergency with some of the accused on bail absconding. Tarimela Nagi Reddy died underground during the Emergency while some other leaders are still underground. The Secunderabad conspiracy case, involving revolutionary writers besides political leaders, is still dragging on.

Many of the accused in the Parvathipuram conspiracy case were killed by the police in so-called encounters after the charge-sheet in the case had

be filed. It has taken nine years between the filing of the charge-sheet and disposal of the appeal by the High Court. Most of the accused had already been taken into custody either under preventive detention laws or in connection with criminal charges when the charge-sheet in the Parvathipuram case was filed. This means that many of those implicated in the case spent as long as nine years in prison, though the case against them was not proved. It is a clear case of miscarriage of justice, of sentence of imprisonment by an executive diktat. It took six years after the charge-sheet for the sessions trial to be completed and another three years for the High Court to dispose of the appeal.

Since the alleged offences relate to the Srikakulam girijan armed struggle, the state government launched the prosecution to keep the leadership and important cadres of the movement out of the scene of action. The prosecution had alleged as many as 81 armed encounters between the Naxalites and police forces and had cited several crimes like murder and dacoity allegedly carried out in furtherance of the conspiracy.

The charges leave little doubt that the case was of a political nature. Individual acts of alleged dacoity and murder, etc, were aggregated to form part of an omnibus conspiracy case. Some of the accused had been acquitted when tried on these specific charges. And these alleged offences were supposed to have been carried out in furtherance of an alleged conspiracy. It was an absurd situation amounting to trying the same persons twice-over for the same alleged offence.

Much of the evidence in this (as well as in other conspiracy cases in Andhra Pradesh) is the aggregate of evidence in specific cases and the witnesses in the conspiracy case turn out to be those examined in connection with specific cases. Some of the accused in the Parvathipuram conspiracy case are also among the accused in the Secunderabad Conspiracy Case. There is a grim, bizarre pattern to it.

West Asia

Israeli Expansionism in Action

THE renewal of Israeli attacks on Lebanon, almost before the ink on the Washington-inspired Egypt-Israel peace treaty has dried, has, apart from gravely embarrassing the Egyptian President who despite all the evidence to the contrary maintains that he is still committed as [illegible] the Palestinian [illegible], also opens up possibilities of further Israeli consolidation in southern Lebanon. The attack has to be seen in the context of developments that immediately preceded it, especially the announcement by the commander of the Falangist forces in southern Lebanon that the region has declared itself 'independent'. That move could not have been made without encouragement from Israel which has virtually controlled the region south of the Litani since its invasion of March last year.

Ever since that invasion a major aim of Israel has been, first, to secure a buffer on its northern borders contiguous to its already consolidated hold on Golan; and, secondly to make Lebanon resile from the historic Arab position that no Arab state would accept any settlement in West Asia that did not provide for a just settlement of the Palestinian question. With the remarkable success that Israel has had in securing a settlement with so important an Arab country as Egypt, Israel is naturally anxious to continue its job of winning over to its side other Arab nations, one by one, by a judicious mixture of force and inducement. Lebanon, more than any other Arab country, qualifies to be the next Arab country which might be amenable to such pressures.

The present invasion has many similarities with the invasion 14 months ago. When, in March last, Israel launched its massive invasion of Lebanon, the ostensible reason was the provocation offered in the shape of a Palestinian guerilla raid. That retaliation, which too took the form of a land, sea and air attack involving over 25,000 of regular Israeli troops, led to virtually the whole of southern Lebanese territory south of the river Litani being occupied by Israel and the consolidation of the Falangist elements in the region who had already been involved in a civil war against Lebanese left wing elements. In the present instance too, the provocation has been the PLO attack at Nahariya on April 22, and the response has been equally massive with Israeli infantry backed by tanks crossing into Southern Lebanon; and its political fall out has been the further consolidation of the Lebanese Christian right in Southern Lebanon.

With the remarkable success Israel has achieved in neutralising its most dangerous opponent among Arab nations, Israel's perspectives and [illegible]ment [illegible] invasion, so [illegible] events of March last, has to be seen as Israel's way of serving notice on Lebanon that it too should break with the other Arab nations and seek a separate treaty with Israel. Such a notice is indeed contained in the Israeli Prime Minister's address to the summer session of the Israeli parliament on May 7 where Begin has invited Lebanon to enter into peace negotiations. Quite characteristically, Begin has been at his sabre-rattling worst even as he is calling upon Lebanon to enter into peace negotiations in his vow to continue his "unrelenting war of attrition" against the PLO. "We will attack them, with all our force from the sea, the air and on the land in order to destroy them."

While the 'peace treaty' that he has signed with Egypt includes a provision for the eventual emergence of a Palestinian entity in West Bank and Gaza in the form of a 'self-governing authority' which might progressively become 'autonomous' and even 'independent'. Begin has gratuitously demanded that Lebanon should not absorb the Palestinians who have been driven into that country to seek refuge from Israeli expansionism, but should drive them off to countries like Libya, Iraq or Saudi Arabia, geographically further away from their original homes than their present wretched camps. And even while the commander of the Falangist forces claims that he did not consult Israel before declaring the 'independence' of Southern Lebanon, Begin for his part has assured that Israel would continue to expand its aid to the Lebanese Falangists both in the North and the South of the country — clearly serving notice that the putative 'independent' republic of southern Lebanon might in due course, with the necessary help from Israel, establish its authority over the whole country. For good measure, the Israeli Premier has also served notice on Syria demanding that it should withdraw its troops from Lebanon even as he has ruled out the possibility of a return of Golan Heights — whatever tacit understanding that might have existed during the civil war in Lebanon now obviously ceased to be relevant in Israeli calculations — and no less a hawk than Moshe Dayan himself has been hauled up by Begin for venturing to suggest recently that Israel might find it advisable to give up Golan in exchange for peace.

Clearly, the never-ending Israeli expansion is due for a further push.

The Military Establishment

Romesh Thapar

IN the Capital, there is much speculation about the Pakistani attempt to create a nuclear presence with the assistance of Arab funds and pressures. Our own nuclear lobby has surfaced and I would not be surprised if we were in the throes of a rather bitter controversy over nuclear "devices" within a few months which might split the Janata heirarchy on an issue for the first time.

It is well known that our successful explosion of a "device" at Pokaran occurred after several failures, that considerable effort was put into the drive when Indira Gandhi's political calculations demanded it, and that "devices" are not "instance" — unless, of course, a member of the nuclear club helps out. Pakistan has many suction points. If one does not oblige, another will for some hidden pay-off. The Indian assumption is that Pakistan will detonate a "device" sooner than we expect.

This nuclear proliferation will have wide repercussions on the situation in Southern Asia, but in the meantime the military situation is receiving a fresh look with the publication of the book on the NEFA debacle of 1962 ("The Unfought War of 1962" by Lt Col J R Saigal) which tells us that no war was fought, that so much of the reportage about "waves" of attacking Chinese and "superior fire power" was a figment of someone's vivid imagination, that many of the commanders who failed to fight repeated their performance against Pakistan in 1965, and that the Majors of those days are the Major-Generals of today.

The long-forgotten Defence Ministry investigation of the debacle (known as the Hendersan-Brooks Report!) is again in the news. Successive Army Chiefs have restricted its circulation to themselves! Admittedly, the investigation is in the nature of an Intelligence operation — and, therefore, needs thorough verification — but it is incomprehensible why a report of this kind has not seen even limited circulation at higher military echelons. It is also known that several key figures in the 1962 debacle were never asked to contribute their knowledge: a strange commentary on the way these matters ase handled when "leaks" have already been published (refer "India's China War" by N Maxwell).

These facts, together with a revealing review of "The Unfought War of 1962" by Lt General Harbaksh Singh which confirms rumours about haphazard military decision-making in the 1965 war with Pakistan, cannot but cause disquiet. Islamabad now has a land army of nearly half a million men — larger than ever before. There is talk of nuclear developments and an Arab "armament pool" (whatever that might mean). And the Punjabi-dominated martial law system is so unsteady that it might well think of diversions, apart from Afghanistan. Fears of this sort crystalise the demand for a closer look at India's military capacity, still very much spread out over a varied and sprawling frontier.

Defence Minister Jagjivan Ram's careful self-confidence may well come in for shock treatment if the public is not fully informed about the past and the lessons that have been learned from it. Already in the villages, people are talking in disparaging terms about the way recruitment is being done to the defence services. It takes anything up to Rs 2,000 to "get in". This shocking fact is known to the senior brass, but no one stirs to get the men who are sabotaging — yes, sabotaging is the word — the defence system. Corruption in recruitment means that the best material is not being located.

We have accepted corruption for the recruitment of peons, stenographers, policemen and school teachers. Maybe, the net is even wider. Enormous sums are being paid to "get in". Once that's done, there must be a hundred different ways to collect the thousands of rupees that have been paid. The politicians play the game. Why not the smaller actors on the national scene. But when it comes to soldiers, we had better watch out. The sooner this business is stamped out, the better — or else we might end up with an uncertain fighting force of some one million men.

It would be interesting to know why a certain number of watch-dog committees, composed of some of our more distinguished officers, cannot be established at some level to overlook the recruitment system. At the moment, the recruiting officers do not even take notice of letters from Lieutenant Generals recommending the services of members of distinguished military families if they meet the rigid requirement laid down. Who is protecting the miserable recruiting shelf?

To illustrate the point, we are also in the middle of a spy story involving not one or two key personnel, but a large number of officers and other ranks. It is alleged that they were working for Pakistan in the Poonch area. The whole business defies all the basic principles of spy dramas — and we come to know about it when the wives of the arrested men begin a sit down outside the Defence Minister's house claiming that their husbands are being tortured. We await the promised details of this story of "mass spying" with more than ordinary interest.

If these are straws in the wind, I think it might not be such a bad idea to approach the whole question of the future structure of the Indian military establishment with a very open mind. We have inherited very valuable British military traditions which insulate our armed forces from the political pressures of the day, but it is quite another matter to use such traditions to make thinking people illiterate on military matters. It is here that some hard work has to be done. Would it be too much to expect the present ferment to make this more lively interest possible. A first step, and a valuable one.

May 5

REQUEST FOR BACK VOLUMES

We are in need of back volumes of *Economic and Political Weekly* from 1966 to 1970. We shall be grateful to readers who can offer us complete sets for any or all of these years.

These will be paid for at Rs 75 per volume plus packing and forwarding charges.

Those who have substantially complete sets for 1966 and 1967 are also requested to write to us, giving the dates of the missing issues.

Turning Adversity into Profit

Hansavivek

GUEST KEEN WILLIAMS has been permitted to carry on business under FERA with the existing foreign holding of 58.7 per cent, by moving into sophisticated technological areas with. in a couple of years. Considering the current product profile of the company and the anticipated gowth in sophisticated technological areas, the management has accepted this option. Founded 55 years ago, today GKW has five divisions manufacturing a variety of products. Sankey pressing division makes electrical steel stampings and laminations and the steel division turns out electrically melted special steels, leaded and sulphurised freecutting, alloy, carbon and spring steel hot rolled bars and coils and billets. The fasteners division manufactures high tensile fasteners, mild steel bolts and nuts and spikes. The forging division makes drop, upset and open hammer forgings for automotive, railway and other industries. The engineering and machinery division fabricates special purpose machinery and equipment and also undertakes reconditioning, jobbing and motor rewinding services. Aided by a favourable market trend, GKW has recorded a fair recovery during 1978. Most of its products met with rising demand, and in many instances with improved realisations. Net sales increased from Rs 82.95 crores to Rs 92.42 crores. With margins widened, gross profit rose from Rs 7.24 crores to Rs 9.40 crores. Net profit was Rs 3.47 crores (Rs 2.47 crores). Dividend has been stepped down from 14 per cent to 12 per cent, but is payable on the capital enlarged by a one-for-two bonus issue. The effective higher distribution is covered 1.70 times by earnings as against 1.29 times previously. This improvement in the performance has occurred after taking into account the additional charge for wages arising from wage settlements and production-linked bonus agreement for annual bonus negotiated during the year. In the context of the general labour unrest throughout the country, the company can derive satisfaction in being able to maintain industrial relations on an even keel in almost all its units in the country. Barring minor disruptions, it did not encounter serious proplems in the area of industrial relations. The company's performance was adversely affected by two factors beyond the control of the management. First, the power shortage at the Howrah works was so crippling that it entailed loss of production ranging between 15 and 20 per cent. Secondly, operations at Howrah works were disrupted in September/October as a result of unprecedented floods which ravaged West Bengal. Power shortage remains a major constraint. K C Maitra, who had

been in the organisation for 35 years, resigned from the board as well as chairmanship of the company in August 1978. K B Lall, who retired from Indian Civil Service, was appointed as the new chairman.

COROMANDEL FERTILISERS has planned further growth by diversifying into manufacture of cement. It is seeking a 'letter of intent' for this purpose. It intends to set up a plant with an annual capacity of 9 lakh tonnes of cement in Cuddapah district of AP. A detailed geological study, for providing the limestone deposits, is under way and a report thereof is expected soon. The company's proposal has been approved under the MRTP Act. Last year, the company made substantial repayments on its long-term loans. With these payments, the debt-equity ratio stands vastly improved, indicative of the financial strength that could provide the base for substantial growth in the immediate future. Over the year, shareholders' equity has increased from Rs 35.30 crores to Rs 38.14 crores, while long-term debt has decreased from Rs 13.56 crores to a mere Rs 3.35 crores. During 1978, the company produced 2,30,000 tonnes of fertilisers equivalent to 1,28,000 tonnes in terms of nutrients 'N and P' compared to 1,32,000 tonnes of nutrients produced during the previous year. Production could have been more but for the intermittent breakdowns that occurred because of an ageing plant. Steps are being taken for a phased replacement of equipment. Net sales fell from Rs 57.91 crores to Rs 51.74 crores, but gross profit was only marginally lower, at Rs 14.74 crores against the previous year's Rs 14.88 crores, showing appreciable enhancement of margins. Net profit is higher at Rs 5.90 crores (Rs 5.42 crores) and unchanged dividend of 20 per cent on the capital enlarged by a bonus issue is still covered 1.88 times.

ATLAS COPCO (INDIA)'s 1978 results are unexciting with sales and profits only slightly higher than their respective levels the previous year. Dividend on substantially enlarged capital, reduced from 16 per cent to 10 per cent, requires a larger disbursement but is still covered 3.47 times by earnings. The company issued in August 1978 bonus shares on a one-for-one basis, but these shares are entitled to the full proposed dividend. The 8,11,216 equity shares, allotted to existing Indian shareholders on a 'rights' basis and Indian directors and employees, will be eligible for only about 9 paise per share on a *pro rata* basis. These shares, of Rs 10 each, have been issued at a premium of Rs 6.50 per share. With this issue, the non-resident interest in the equity capital of the company has been reduced to less than 40 per cent. The company is going ahead with its expansion and diversification programme. Orders have been placed for machine-tools required for the manufacture of aqua rigs and mechanised drilling equipment, and construction of new buildings will start soon. The company expects to introduce two new machines in the market in the middle of this year and another new machine early next year.

CENTRAL INDIA SPINNING has shown a significant improvement in its performance with a net profit of Rs 23 lakhs against a net loss of Rs 14 lakhs in the previous year, despite slightly lower sales. The performance would have been still better had the working not been interrupted by a labour strike lasting 47 days. The profit has been utilised to reduce the accumulated deficit to Rs 1.37 crores. Availability of cottton at reasonable prices helped to achieve better results. The company was also exempted from the obligation to manufacture controlled cloth during the last quarter of the year. The current year holds out promise of further improvement in view of the expected contribution from the paper project which started commercial production from the beginning of the year. The project is expected to prove profitable because of the good demand for paper. This diversification apart, the management has planned modernisation of the textile mills by availing a 'soft loan' of Rs 2.74 crores under the IDBI scheme. N H Tata, chairman, feels that if there are no further fiscal shocks for a while, the prospects are good enough to reward the shareholders for their "infinite patience and confidence in us". The company has not paid any dividend for the past four years.

USHA MARTIN BLACK earned a gross profit of Rs 115.10 lakhs in 1978 (Rs 126.82 lakhs). After charging Rs 24.81 lakhs (Rs 31.07 lakhs) for depreciation and providing Rs 32.95 lakhs (Rs 35 lakhs) for taxation and Rs 8.39 sakhs (Rs 5.49 lakhs) for investment allowance reserve, the disposable profit for the year is Rs 41.04 lakhs (Rs 64.01 lakhs). The recommended 10 per rent dividend on equity shares will absorb Rs 28.70 lakhs (Rs 28.81 lakhs) and the balance of Rs 2.84 lakhs (Rs 35.19 lakhs) is proposed to be transferred to general reserve. Production of the company's Ranchi factory went up from 24,305 mt in 1977 to 25,305 mt in 1978, despite serious and unprecedented power interruptions and failures. Sales rose by 11.5 per cent from Rs 23.3 crores in 1977 to Rs 25.0 crores in 1978. However, increase in manufacturing and marketing costs more than offset the gain from rise in production and sales, resulting in the lower gross profit for the year. The company's exports rose by 28 per cent in 1978 to Rs 5.6 crores (Rs 4.4 crores) and it continues to be the country's largest exporter of wire ropes. The company's wire rod mill set up at Adityapur near Jamshedpur at a capital cost of approximately Rs 5.70 crores for manufacture of 50,000 tonnes of wire rods annually went into production in March 1979.

CEAT TYRES OF INDIA showed a substantially better performance in 1978 by achieving record output of 1.1 million tyres It is now set for further progress. Its expansion programme is expected to be completed before the end of this year. Since part of the expansion would become operational by middle of this year, the company hopes to sell an additional 55,000 tyres and tubes in 1979 and another one lakh pieces in 1980 by operating expanded facility at full capacity. P A Narielwala, chairman, does not envisage much difficulty in marketing the additional output as he says that demand for the company's products continues at a satisfactory level.

JYOTI CONSULTANTS Baroda, has been established for rendering consultancy services in an integrated form in various fields of business and socio-economic activities. It provides comprehensive service right from generation and testing of new ideas, feasibility studies, financial and organisational planning to project engineering and procurement, supply, erection and commissioning of plant on a turnkey basis. It also offers special services to public institutions and government development agencies in formulation, and monitoring of programmes for sectoral and area development and in enhancing their organisational competence to manage such programmes satisfactorily.

NEW DELHI

Playing Politics with the Economy

B M

THE prolonged infighting in the Janata Party and the growing bitterness and militancy with which the various factions in the ruling front are contending against each other could not but have its repercussions on the functioning of the government. A facile idea has been cultivated in some quarters that factional quarrels may go on at the party-political level and that the normal work of government can be insulated from their impact. However, the position seems to be heading towards a crisis so fast that the decision-making process at all levels, including at the cabinet level, is now beginning to be directly effected by factional considerations. The fact indeed is that the principle of collective Cabinet responsibility is itself getting eroded. A remarkable feature of this development is that the Prime Minister is actively contributing to this process.

The position till recently was that it was all smooth-sailing in the Cabinet and all proposals presented by different ministries were adopted "unanimously" without much discussion. This style of functioning was obviously a concession to the federal composition of the ruling party and of the Cabinet itself. The position has, however, undergone a dramatic change in recent weeks, specially after the fall of the UP government headed by Ram Naresh Yadav and more particularly of the Karpoori Thakur government in Bihar. These developments have, it seems, precipitated a realignment of political groupings in the Janata party and exacerbated relations among different politcial factions to a marked degree. Those who can be identified as the Prime Minister's followers in the ruling party have taken active part in these developments and, though the Prime Minister has not come out in the open, he has not been above board in the eyes of the rival factions. The Congress(O)-Jana Sangh combination against Karpoori Thakur and BLD in Bihar has received wide publicity. It has been noted since then that the Prime Minister has tended to take an intractable position even on administrative and executive matters of a day-to-day nature under the influence of political factional considerations.

The most interesting illustration of this state of affairs was provided by the stage-managed discussions in the executive of the Janata Parliamentary Party on the work of the Steel Ministry. The Steel Minister, Biju Patnaik, was hauled over the coals in these discussions. But the noteworthy feature of this show, however, was the marked indulgence of the Prime Minister towards the detractors of the Minister and his delight over his discomfiture. The highlight of the proceedings was the readiness with which the Prime Minister offered to "review" a Cabinet decision on the import of limited quantities of coking coal because the critics smelled a rat in these imports and not only found no economic justification for them but also hinted at certain base motives on the part of the Steel Minister in arranging the imports.

It is not possible, nor is it necessary, to uphold or refute the imputations. But the fact remains that the question of coking coal imports went through the usual interministerial paper work and, after the Energy Ministry which is concerned with coking coal production in the country was somehow pursuaded to fall in line and withdraw its earlier objections to the proposal of the Steel Ministry, the Cabinet approved of it. For the Prime Minister to readily agree to "review" the decision of the Cabinet in the circumstances in which it was offered to be done was extraordinary, to say the least and, by implication, must be construed as a reflection on the Steel Minister and his conduct. An interesting sidelight on this episode is that the Energy Minister also did not think it amiss to suggest to the party executive that his concurrence with the Steel Ministry on this matter was not wholly without reservation.

Energy Minister Ramachandran's stand on the coking coal matter had a parallel with his role in the Cabinet when the formal proposal of the Industry Minister, George Fernandes, seeking approval of the Siemens-BHEL deal was stalled on the ground that a Janata MP, Subramaniam Swamy of the Jana Sangh, had written a private letter to the Prime Minister criticising the Industry Minister's proposal. On this occasion, again, he took the stand that he should have an opportunity to further study the proposal and this helped the Prime Minister to not only postpone a decision but even constitute a sub-committee of the Cabinet to make a scrutiny of the proposal. The point here is not that either the import of coking coal or the Siemens-BHEL deal is good or bad. The point is that, in the normal course, the Prime Minister would not have acted in the manner he did except for political-factional factors which are currently at play in the ruling party set up. While in the case of coking coal import, a formal Cabinet decision has been reopened, in the case of Siemens-BHEL, a decision has been stalled on a matter which was within the competence of the Industry Ministry to take on its own but which was presented for prior backing of the Cabinet because of the sharp controversy that has surrounded the proposal. On both counts, the two Cabinet Ministers have obviously been placed in a most awkward position, which is only just short of asking them to submit their resignations.

Another Minister in the Cabinet who has been placed in a similar awkward position is the Railway Minister, Madhu Dandavate, on the question of bonus to railwaymen. The question has been examined in full by a Cabinet sub-committee and presumably it decided in favour of giving the bonus. But when the issue came up before the Cabinet for decision, it was decided that the matter be further processed by the Finance Minister — obviously an extraordinary procedure. Meanwhile, the tussle between the Railway and Energy Ministeries on their respective share of responsibility for the movement of coal or lack of it has become an interesting part of the goings on in New Delhi.

These developments and the general style of functioning of the Prime Minister which came under considerable adverse comment when he took peremptory decisions on reorganising the Council of Scientific and Industrial Research and introducing the rolling plan system in Yojana Bhavan have made many of his Cabinet colleagues quite restive. It is probably as part of this scenario that some of them — George Fernandes being very prominent in this respect — are trying to

take militant postures on their side of the fence. Fernandes's public statement that in any agitation of railwaymen for bonus he would side with the workers was probably inspired by these considerations. His campaign on nationalisation of certain industries and other wordy duels with big business houses have the same motivation. He has opened a new front on the issue of nationalisation by his proposal to nationalise the artificial fibre industry as a punishment to Birlas for their alleged breach of licence regulations.

Interestingly enough, the Prime Minister is extra careful in dealing with the Finance Ministry now presided over by Charan Singh. Charan Singh, it would appear, will not brook any interference without immediately precipitating a break up of the fragile Janata combination and the Prime Minister will not risk that.

BOMBAY

Rickety Municipal Finances

Amrita Abraham

THE size of Bombay's Municipal Corporation budget could well be that of a small state. For the current year it is some Rs 210 crores. For a city that is popularly thought of as one of the better run in the country its finances show a surprising amount of flabbiness. Its relations with the state government have many of the ingredients of Centre-state relations: annual demand-making met by unfulfilled promises. Its resource-raising and expenditure pattern show where the city's heart lies.

The BMC budget consists of several constituent budgets, each of which is the concern of specific committees of councillors The first fact about BMC budgets is that councillors by and large limit their influence to a bit of window-dressing after the Municipal Commissioner has made his proposals and the standing committee has made a few judicious modifications to those proposals. This is because of ignorance and indifference. This year the education committee for instance had to delay its meetings for lack of a quorum A party-man said his party councillors don't contribute much to budget-making, they prefer 'social work' in their constituencies!

The main or 'municipal' Budget A is the keystone of corporate affairs not only because it is the largest (about two-thirds of the whole) but also because it must contribute statutorily to the others — Budget B (Improvements), Budget E (Education) and Budget G (Water Supply and Sewage Disposal). All these contributions as well as a special contribution to the Education Budget, which has been a regular feature for some years, take something like a sixth of Budget A's income. Also, Budget A has more scope for raising income than any of the others.

When the Commissioner presented revised estimates (RE) for Budget A for 1978-79 (a normal year by all accounts) they showed a 10 per cent drop in income matched fortuitously by an equivalent drop in expenditure. The villains of the piece on the income side were property taxes and octroi levies which together bring nearly nine in every ten rupees of Budget A's income The other defaulter was the state government — 'anticipated' grant-in-aid did not materialise.

Budget A pays for traffic operations, roads and bridges, street cleaning; general supervision and revenue collection and so on. But the fall in expenditure was explained in large part by decreases in health outlays including medicines and instruments and establishment; unspent provision for municipal staff activities, unspent provision for repairs and maintenance of things like storm water drains and buildings. Thus was a fall in income neutralised and a deficit budget converted into a surplus one. Both the Commissioner and the standing committee have made a special point of the strain on the city's municipal health services and the fact that they take 30 per cent of Budget A's resources without contributing much to income How then do they explain that half the 'savings' in expenditure could be extracted from the health budget? Perhaps because the public has long been resigned to overcrowded conditions and long delays and wouldn't feel the difference from several unspent crores anyway.

For the current year increases in estimated income rely almost solely on octroi. This is the only area where the standing committee flexes its muscles. First the commissioner estimated that levies would bring in Rs 5.5 crores more than the RE for 1978-79 and then the standing committee piled on another Rs 2 crores to this. Both of them have not been unduly shaken by the fact that last year octroi collections fell short by Rs 5 crores. The only consolation we are offered in this slap-happy budgeting is an assurance from the Commissioner that vigilance machinery has been streamlined and that malpractices will be dealt with severely.

There was a time when property taxes were the mainstay of the civic budget followed by octroi. Since 1973-74 the positions have been reversed with octroi forging far ahead This year octroi will bring in an estimated Rs 63 crores and property taxes Rs 33 crores, according to the Commissioner, and Rs 34 crores according to the standing committee's modifications. This is another instance of building castles in the air Last year collections fell short by Rs 2 crores and the astounding fact about property taxes is that arrears have been accumulating for several years and now amount to Rs 42 crores including some instances where court cases are pending The Commissioner has announced that a recent Supreme Court decision allows the corporation to collect property taxes even before disputes are settled He expects this to help BMC recover some Rs 9 crores in arrears. But this is not necessarily going to happen in the current year and no one has any answers about the rest of the arrears

As Boman Behram, independent councillor for several terms, has pointed out, one reason for this gross negligence about arrears is that the Corporation acts as tax collector to the state government. It hands over the revenue it collects on the state's behalf, (a repairs cess, unemployment and state education cess, etc) on the dot every year The reason is that the screws have been put on the Corporation for failure to collect government dues by a clause in the BMC Act which entitles the government to prior claim on the municipal Corporation's revenues. There is no such pressure on the Corporation to collect its own dues.

One of the reasons why property

taxes have remained fairly static — Rs 20 crores in 1973-74 to Rs 29 crores in 1977-78 — is a government ceiling fixed at 25 per cent of rateable value. And that point has been reached — it is 24 per cent in all parts of the city. However, it is within the purview of the Corporation to revise the rateable value of properties. But this kind of taxman's tool is blind in that it does not distinguish between the incomes f households in a locality. Thus, in most parts of the city rateable value is fixed on the basis of a series of comparative costs in the locality. An upward revision would mean that those with fixed and low incomes would be burdened far more heavily than others. This gives the Corporation the excuse it needs. The result is that those who can in fact afford to pay twice and three times what they are paying now as property taxes are not required to.

The Corporation, to give its due, has tried to amend the Rents Act to give itself more scope to revise rateable value but as the Commissioner says in his notes this has not been sanctioned by the government and "there is no likelihood of the amendment being put through in the near future". The Corporation also tried recently in a new housing area, where incomes were likely to be uniformly high, to use a new basis for fixing rateable value, that of the 'contractors test' taking into account current market price of land and construction, plus a percentage. This naturally worked out so much higher than the rateable value in older, fixed-rent localities and led to such opposition from flat-owners that the rate had to be substantially reduced. Unless the Corporation can find some way of relating additional property taxes to the income levels of households it is unlikely in the peculiar housing situation of Bombay, that property taxes will yield much more in future years.

There are no other new taxes in the latest budget. Most corporators seem to think that the city's capacity to pay for better services has been tapped to very nearly the maximum. The debates in the house show that they feel instead that the state and Central governments should bale them out (a) because of the income that the city generates for both of them and (b) because Bombay has constantly to expand its services to encompass migrants from all over the country. Meanwhile debt charges in Budget A have risen from Rs 9.3 crores (RE) 1978-79 to Rs 14.43 crores (BE) 79-80. A large part of the increased expenditure this year will go in establishment charges, chiefly on account of increased DA for staff.

The cumulative effect of flabby budgeting and poor resource raising and collections is most visible in the section of Budget B shown separately as Slum improvements. Budget A contributes Rs 2.41 crores to Budget B this year, all of which goes on general improvements schemes for the city and suburbs. For slum improvement there is a special allocation of Rs 1.50 crores to meet the deficit in the general account. But even this is far from adequate for the modest expenditure that is planned totalling Rs 7.31 crores in the general account which is essentially for maintenance. The slums themselves, on municipal, state and Central government and private lands bring receipts of nearly Rs 3.70 crores. The rest, some Rs 2.10 crores the Corporation hopes will come as a subsidy from the state government Since 1969-70 when the Corporation began its slum improvement schemes they have covered, according to the commissioners' notes some 13 lakh of slum dwellers This gives an idea of what the expenditure per head is Altogether there are some 26 lakhs slum dwellers (four in ten of the city's residents) and though this is alo the state government's responsibility, it is worth noting that the Municipal Corporation's efforts are incredibly marginal.

More than a third of this year's expenditure in the general account will go on establishment charges. What is even more illuminating is the fact that while BE for expenditure last year were Rs 6.36 crores, RE show only Rs 3.95 crores, more or less what was actually spent in 1977-78. Capital expenditure on slum improvement is even more pathetic: receipts Rs 2.40 crores, proposed expenditure Rs 3.80 crores for the current year.

There is little doubt that the Corporation suffers from the effects of the state government's niggardliness and the Education Budget is a good example of this. There is a deficit of Rs 11 crores this year in Budget E. The usual special contribution of Rs 9.73 crores from Budget A will help reduce that deficit. On the other hand, not only has the state government left the entire responsibility of expanding primary education to the Corporation, it does not pay its full contribution to primary education. After a long drawn out tussle the state government agreed to pay 20 per cent of 'admissible expenditure', then chose to interpret that term in such a way that the Corporation actually gets only 13 per cent, far less than other civic bodies in the state. The Corporation feels that the government should provide 50 per cent grant-in-aid to primary education.

INDUSTRY

Much to Hide

(By a Special Correspondent)

THE annual report of the Ministry of Industry for 1978-79 is a noteworthy document more for what it conceals than for what it reveals. Over the years, the Industry Ministry's annual reports had tended to grow in size, which was perhaps justified considering the ministry's expanding role in regulating and promoting industrial growth. As the latest report claims, "The Ministry of Industry, apart from being responsible for the development of certain specific industries, is also the nodal ministry for co-ordinating government's policy for development of the industrial sector (i e, steel, mines, petrochemicals, fertilisers, etc) as a whole". The ministry administers the Industrial (Development and Regulation) Act, 1951 and the entire system of industrial approvals pertaining to industrial licensing, foreign collaboration and import of capital goods. It has also a major role in the processing of FERA cases. It has under its control such important technical and advisory bodies as the Directorate General of Technical Development, the Bureau of Industrial Costs and Prices, and the Economic Adviser's office. The Ministry has under its charge the bulk of public sector undertakings, as many as 35, covering a wide range of industries — equipment for the power sector, industrial machinery and machine tools, automobiles, structural fabrication, cement, paper, textiles, leather and leather goods, newsprint, ophthalmic glass, salt and photofilms. A number of promotional organisations like the National Industrial Development Corporation, the Small Industries Development Organisation, Development Commissioner for Handlooms, Development Commissioner for Handicrafts, the Khadi and Village Industries Commission, Coir Board and Jute Commissioner are under the jurisdiction of the Ministry.

For this reason, as mentioned earlier, the ministry's annual reports had tended to become bulkier and bulkier over the years. The report for 1976-77 had 325 pages and that for 1977-78 500 pages. In sharp contrast, the latest report for 1978-79 runs to just 164 pages. Of course, one cannot be so naive as to judge the quality of the report on the basis of the number of pages. Thus, the gigantic size of the earlier reports did not mean much in terms of providing insights into the content of industrial growth or in terms of reflecting a wider perception of the government's industrial policies and their operation. Even so, the reports contained, unwittingly perhaps, many details about specific projects and programmes which could be the basis for further review and analysis by those who were interested. The report for 1978-79, on the contrary, skips all such details and, as a result, loses even that modicum of usefulness which the earlier reports had possessed.

It may appear that the abridgement of the report this year is just an attempt at cutting down unnecessary verbiage or details. This may even be partly true, but many omissions do not appear so innocent. The omissions may well be intended to hide either some unpalatable facts or certain subtle changes of policy which have been the subject of much controversy in recent months.

Some of the conspicuous omissions which may have been deliberate are those relating to the commission of enquiry on large industrial houses, the proposed collaboration agreement between Bharat Heavy Electricals (BHEL) and Siemens of West Germany, and the appointment of an industrialists' committee to advise the government on industrial licensing policies and procedures.

The functioning (or non-functioning) of the A K Sarkar Commission of Enquiry on large industrial houses (particularly the Birlas) used to be reported on every year since its institution in 1970. Last year's report had said that "so far the Commission has scrutinised over 9,000 files out of 12,000 required to be studied". The latest report, however, makes no reference to it at all. It may be that the government was unhappy about the slow pace of the Commission's working and had, therefore, already decided to wind it up. But even this is no reason to omit all mention of the Commission from the report. The ministry perhaps chose to omit mention of the subject because any reference to it would have perforce entailed some specific enunciation of the government's policy in regard to large industrial houses.

Similarly, though it had been widely reported that the Industry Ministry had appointed a committee consisting only of industrialists to advise it on licensing policy and operations and that the committee had even come out with a series of recommendations for further liberalising the regulatory mechanisms, the annual report of the ministry is totally silent on the subject. Interestingly, the report also does not make any reference to the Central Advisory Council of Industries constituted under the Industries (Development and Regulation) Act 1951 for the purpose of "advising government on matters concerning the development and regulation of industries coming under the purview of the Act". The report for 1977-78 after explaining the composition of the 30-member Council, had promised that "steps are being taken to reconstitute the Council".

The most conspicuous omission, however, is that about BHEL's activities. The report claims that BHEL has not only "maintained its position ... as the largest engineering unit in the country" but that it "now ranks as the seventh largest unit engaged in the manufacture of electrical equipment in the world". Its annual report should have been used as an opportunity by the ministry to spell out its own justification for the proposed collaboration with Siemens. Instead the report fails to make even a reference to this development or to BHEL's so-called attempt at upgrading its technological profile. In the past the annual reports generally gave some useful details about BHEL's activities, which cover ten manufacturing units, including two subsidiaries, and ten other divisions. Last year's report devoted about 12 pages to BHEL including two detailed tables (one containing unit-wise and product-wise data on installed capacity and output and the other giving information on BHEL's 31 existing foreign collaborations, six with UK, five with USA, five with the Eas European countries including USSR, three each with Sweden and Switzerland, two with France, one with Italy and six with West Germany, including three with Siemens). The latter list contained some details such as the products for which the collaborations had been entered into. On the other hand, the current year's report does not even

mention any of these subjects. The 1976-77 report had revealed that BHEL's Hyderabad unit had added high speed industrial turbines and centrifugal compressors to its product range and that these would be "manufactured in cllaboration with Siemens and Nuovo Pignone of West Germany and Italy, respectively". This fact was repeated in the report for 1977-78. The earlier reports had also contained a separate section on BHEL's "directional pattern of investment — major expansion schemes and diversification proposals". The latest report is silent on the subject except for references to two subjects, which probably represents an indirect defence of the Siemens collaboration. First, it is emphasised repeatedly that BHEL has advanced from being a supplier of hardware to being a supplier of total systems, from concept and erection to commissioning and after-sales service and that "taking into account its increasing responsibilities, BHEL's efforts are directed towards keeping pace with customers looking for more sophisticated and larger unit size equipment". Secondly, the report reveals that "with government emphasis on the importance of research, design and development as an essential back-up for a growing organisation and for quicker assimilation of imported technology, BHEL is setting up a corporate research, design and development centre at a cost of about Rs 17 crores at Hyderabad".

Besides these omissions of a specific nature, this year's report is conspicuous for the total absence of any useful reference to what earlier reports used to describe as "policy objectives". Under this head a specific reference used to be made to the subject of "self-reliance". For instance, the 1976-77 report had stated: "there is also an increased emphasis that the technology imported hitherto should be absorbed and then improved upon within the country so that the umbilical cord of foreign technology should be cut at the appropriate time. In accordance with this policy, the Department has been gradually disallowing the extension of the existing foreign collaboration agreements... The Department has been concerned with the repeated import of same technology with the multiplicity of units entering in the field of manufacture of the same items. Wherever possible, the policy of the Department has been to arrange for a horizontal transfer of technology". The whole subject of self-reliance has been discarded in the 1978-79 report (as also in the previous year's report).

Even the coverage of small-scale and village, khadi and handicrafts industries is very perfunctory. Last year, the chapter on "Small-scale Industries, Industrial Co-operatives, Appropriate Technology and Closed Units" had not only contained a description of the new policy stance in favour of such industries but also an evaluation of their performance in regard to the value of output, size of fixed investment and employment generated. The report had said: "It has been possible to indicate the number of units, value of production, investment, and employment because of the completion of the Census of Small Scale Units and implementation of the Scheme of Collection of Statistics". It presented the data for five years from 1972 to 1977 and also estimated the index of industrial production for all industries and in respect of 14 major industrial groupings (with 1970=100 as base). The report had contained an industry-wise profile of small-scale units. The report for 1978-79 does not show any awareness of these data. In fact, it seems that the entire statistical system has gone haywire, for there is a cursory reference to the number of registered units and output of registered as well as unregistered units, but only upto the year 1977 for which the data had already been presented in the previous year's report. The report for 1977-78 had cited the number of registered small-scale units as 2.47 lakhs in 1976 and 2.69 lakhs in 1977, whereas the latest report places the corresponding figures at 2.60 lakhs in 1976 and 2.87 lakhs in 1977. The report does not question as to how commercial banks could have granted advances to as many as 4,25,700 small-scale units as in March 1977 and to 4,99,794 small-scale units as in March 1978, when the registered units numbered only 2.87 lakhs even in the latter year.

One of the important programmes for the development of rural industries is the Rural Industries Project (RIP), which has been under implementation in 112 districts covering all the states and Union territories. The 1977-78 Report had reported the existence of 2,15,000 units under the RIP programme with an investment of Rs 431.98 crores, gross output of Rs 535.37 crores and employment of 7,08,200 persons at the end of 1977-78. This year's report does not show any awareness of the existence of the RIP scheme.

Likewise, last year's report had stated that there was a proposal, "now in the Planning Commission, to set up an Authority for Backward Areas Development (ABAD)" which was "to promote infrastructure facilities, identification and preparation of project reports of propulsive industries based on local resources...". The section on 'Backward Area Development' in the 1978-79 Report continues to talk of the subsidies and fiscal incentives for 246 backward districts and for 101 chronically backward ones, but does not say a word about the ABAD proposal.

These ommissions may to some extent show the scant respect the bureaucracy has for many of the government's promotional and regulatory objectives and roles. To a greater extent they represent an attempt to hide the subtle policy changes which the bureaucracy wants to achieve without publicity, and without attracting the attention of Parliament in particular. They also show utter disregard for factual accuracy, for the continuity of information and for some meaningful review of performance. A ministry which claims to be the nodal agency for industrial development in the country fails to make a systematic review of the performance of the overall industrial sector, except for a half-page ritualistic reference to the subject on the introductory page. The total absence of any analytical intent in the Report is also evident from the data on the growth of public sector undertakings under the Department of Heavy Industry. In respect of 16 units under this Department, the target of output fixed for the full year 1978-79 was 34 per cent higher than the actual output in 1977-78. As against this, the actual output during the first 10 months of 1978-79 (April 1978 to January 1979) was about 7.1 per cent lower than the full year's output of 1977-78 and to achieve the target of 34 per cent growth, the increase in output during the last two months would have had to be of the order of 44 per cent — plainly impossible of achievement. Yet there is not even a cursory reference in the annual report to the likelihood that the targets set for 1978-79 would not be achieved and to the reasons for this.

WEST BENGAL

All Darkness

A STATE with immense potentials forsaken by industrialists, a victim of top level administrative bungling, a land of "load-shedding" that goes on week after week, a place where nothing seems to get done — that more or less appears to be the image that West Bengal presents today to the rest of the world. The image has been built up over the years, inch by inch, newspaper headline by newspaper headline, and by now it has become confirmed. But, as the saying goes, even a dog has his days and things cannot remain the same for all times.

For the present, however, it is all darkness, both literally and figuratively. Load-shedding, an Indian-English coinage that bids fair to get a place soon in the dictionaries has become a part of life. It runs for anything between four and sixteen hours in instalments in Calcutta (longer spells are not unknown); in districts, it is only worse. The position is such that if tomorrow the people of Calcutta start getting power round-the-clock, they would just not know what to do with all of it!

Indeed, when one comes to think of it, it is a remarkable achievement. Surgical operations take place part in electric light, part in lantern light. Or climbing up ten-storeyed apartment buildings. Doing with a few "rationed" buckets of water. Walking out of cinema houses just when the hero is at his most somnolent (or is it romantic?). And passing torrid summer days with only a sheet of paper as a fan Didn't somebody praise the Britishers for the way they lived with five eggs a week, a fixed quota of bread during the war days? The people of Calcutta have proved they can do better.

And mind it, all this is without even a ripple of that notorious Calcutta spirit. There is not even a suggestion of an agitation. "It is difficult to believe that these are the same people who a couple of decades ago turned the city upside down over a one-paise rise in tram fare". The people, to be sure, are the same, but the Indian polity is not. Between that day and today, lies two decades of erosion of moral values, of spreading corruption, of disillusionment with politics and politicians, a creeping fatalism that nothing really changes, a corroding frustration. A herd of sheep cannot move mountains; rogue elephants can, and does not somebody up there talk of moving the mountains — of poverty, unemployment, social injustice?

It would indeed be a sort of monstrosity if such a crisis passes off without at least a few heads rolling, not in the street, but in the corridors of power and in the power plants. Chief Minister Jyoti Basu must be aware of it more than anybody else; he is known to be desperately looking around for people who can take charge of the crumbling situation and put the state back on its feet. His first attempt has failed him. He overhauled the administrative set-up in the power ministry soon after taking charge two years ago. Now he is preparing for the second attempt.

Jyoti Basu had been rather chary at the beginning to concede that the crisis had developed because of management failure. But lately he has been more forthright. He has spoken quite critically of the management of the West Bengal State Electricity Board and Durgapur Projects Ltd. And darts flying from a section of his own party cadre and a section of the pro-Left Bengali press at some of his close aides. In Writers Buildings, some of the secretaries hardly conceal their glee at the controversies that have now developed around some members of Basu's "power team".

Basu has complained, rightly, that the previous regimes had not cared much about the power front and that today's crisis is a legacy of those administrations. Santaldih was supposed to be completed by 1973, now its fourth unit is expected to start operation only around early next year. And so on. No one denies that no government can achieve much in getting a new project cleared or even in adding to the generating capacity in two years. But then such a period should be considered long enough for at least overhauling the existing power plants. In fact, Basu himself has been assuring the people that the plants should be working well — that is what he was presumably told by his men But when the crunch came, it all fell like a house of cards, draining along with it a lot of money and many valuable "expert man-hours".

The standard of management is a function of discipline, and the Left Front can say that the "irregularities" done by the previous regimes are again responsible for the lack of discipline now prevailing in some of the plants. A specific mention has been made of the recruitment of about 10,000 people by the SEB during the previous Siddhartha Ray ministry. The charge is that being the party in power, the Congress inducted its own sympathisers into the organisation without caring about their fitness for the jobs. But this, in today's India, is a routine phenomenon and it would only be the eighth wonder if the CPI(M) can rise above this practice. The chances are that we would be missing this wonder.

For the time being, there could not have been worse publicity for West Bengal than this power crisis. None of the big houses (all owned by people who had come from outside the state) — of which more than ten are said to be headquartered in Calcutta — is showing any interest in any new industrial venture. Only some of the multinational groups are being persuaded by their professional managers to keep their flags flying in the state. But how long this will be so is extremely uncertain. One of the managers said: "We induced our board to put up a new plan in the state. But with this power crisis — along with such problems as local youth asking for jobs in the new venture, not in tens but in hundreds — we do not know how long the board will remain sold on the idea". Construction work at a new industrial plant at Haldia has now to go on with a posse of policemen surrounding the site.

But even the darkest night, as they say, comes to an end. The ordeal of darkness through which the state is now passing should, hopefully, have a chastening effect on all sections of the people, except perhaps among the few who have a vested interest in keeping the pot boiling. It is true that these are also the people who call the shots But then, groundswells do sometimes appear. The course of events during the next few years will be interesting.

One of the fallouts of the current crisis is also likely to be a hardening of the Left Front's stand on getting what it calls a "fairer deal" for the state. The demands for economic justice in the form of more public sector investment, for equality of freights in a number of commodities, for more direct benefit out of its coal and steel — to name only a few points — are likely to become more strident. In the end all this may open up fresh opportunities.

Of Circuits and Networks

David Lehmann

THE term 'Conference Circuit' is a most suitable one, for conferences are occasions for the renewal of old networks and the creation of new ones. On this occasion I found a particularly varied combination: the Chilean Opposition (two activist-officials from Popular Unity days), Indian officialdom (two IAS land reform enthusiasts), four Latin American agrarianists (two Jews, two non-Jews), several present and former Cambridge graduate students dispersed through South and South-East Asia, and even an old disused Oxford/India network (whose tentacles reach into Cambridge, Sussex, the Ford Foundation and so on).

Other networks were new to me, but seemed very suspicious indeed. There are two or three ways of reacting when one comes upon a new network: one can be overawed, suspicious or relaxed. Overawed, because of the inner fears expressed by the term 'name-dropping', the sinking stomach provoked by even an innocent mention of powerful or prestigious persons unknown to us; suspicious because shadowy connections, either counterintuitive or indeed 'strongly suspected', arise in ways which evoke unspeakable deals and alliances, or the mutual attractions of the travelling salesmen of global rhetoric, relaxed reactions are the privilege of the few, but not necessarily of the powerful, perhaps rather of the ignorant or inexperienced, for it is of the essence of conference life that individuals remain alert to the unforeseen and the unknowable, to new slogans and fashions, and thus, in the end, to new individuals who embody and promote them. The world of 'development studies', unfortunately, is subject to a particular brand of terminological racketeering which turns the heart of the erudite to stone. Can it conceivably be the same in the natural sciences? I presume not. Can social sciences in development studies be taken seriously? Not very often.

What was this outfit called CEDEA from a West African capital, apparently run by an airborne Italian and a camp-follower of long-won African liberation wars? And this crowd of Indian narodniks riding high on a murderous blend of tobacco, whiskey and indignation?

The meeting was held in a South-East Asian country which, after a turbulent period of corrupt and violent 'democracy' had finally fallen to the inevitable military coup — and quite a bloody one at that. The country's development programmes were largely being run by the World Bank and sundry other agencies; ten years ago the World Bank was 'running' Brazil and Iran — now it is in control of a handful of banana republics and little more. In this case, the state confined its sketchy presence to jails and barracks and refereeing the struggle for the spoils to be gained from aid contracts. 'Development' was a fight between technocracy and the grass-roots idealism of famine relief and expatiate consciousness-raisers. At the conference itself, the local representatives were mostly from the marooned left-wing intelligentsia. Trained at both Cambridges they had exchanged Anglo-Saxon orthodoxies for the more relevant — though unfortunately also more thunderous — rhetoric of Marxism.

It would be easy to dismiss or belittle these people, for they seemed so isolated from the masses they invoked, and their politics more expressive than instrumental. But at least they were here, and not sitting in international bureaucracies as so many local radicals were now doing. Furthermore, they had seen many activists die in repression, and were no doubt themselves under close watch.

It is a curious feature of repressive third world regimes that they tolerate the intra-mural extremism of university-based intellectuals, but not the more moderate parties of the established left. The reason is simple: moderate or not, the established left is an organised left. But harmless though organised left still run risks. Their situation is unenviable, for they are at once prestigious and ignored: the homage paid to them on account of their doctorates from famous universities is matched only by the contempt shown for their opinions by those in power. Detached from the traditional intelligentsia of mullas and lawyers, they find a more ready hearing in London or California than in their own country.

The proceedings themselves lost no time in degenerating into slogans: too many papers, too many problems, too much despair, too little room for reason. The Latin Americans — once a lone radical voice in the capitalist countries of the third world — gasped at the calls for revolutionary change, for they had learnt harsh lessons in Chile, Peru, Argentina. And they knew too well how profoundly reactionary regimes can appropriate radical discourse for their own ends. Drained of faith, they no longer believed either in the magic of Revolution or in the populist merchandise of international development agencies: appropriate technology, self-reliance, full employment, land reform, integrated rural development, basic needs. comprehensive planning. In the end only the Indians presented confidence: the officials, because it never occurred to them, despite their radicalism, that 'fundamental change' might mean the overthrow of the bureaucracy, so they assumed that whatever happened they would be in the seats of power; and the populists, with their faith in free-wheeling agitation.

How did we all fit in? What were we doing here? Who, in God's name, was paying for this singularly distressing vaudeville? Apparently the Swiss government, or maybe "the Swedes", or "the Canadians". Did it matter? Yes, it did, but among the radicals no one seriously tried to find out. An excessively shrewd Brazilian thought this was perhaps part of a swedish tactic to sow dissension among international agencies they could not control. The conference organiser was using a short-term loan from a European bank while the head of CEDEA had gone to Geneva or New York to collect the funds, as if this was a bootlegging exercise using black money. Meanwhile, the camp-follower of liberation was to pay the bills with a charge card. Maybe this was a front for the opium trade — ideological opium at least.

Design Award for L & T

LARSEN AND TOUBRO has won an international award for the design of its fuse-switch unit FB 250 at the 1979 Hanover Fair. This is the first time that a "Good Industrial Design" award has been given to an industrial product from India. The award entitled L and Ts FB 250 to be exhibited separately at a special function which took place at the Fair and for inclusion in a prestigious catalogue released on the occasion. The award also entitles L and T to use the symbol of the competition sponsor, "if 79", in advertising and sales promotion of the product.

Earlier, in January 1979, L and T had been awarded four certificates of merit in the design competition held by the Society of Industrial Designers of India. The products winning these awards were L and T's pendant push button station, on-off push button station, square skirt enclosure (star delta starter) and thyristor converter.

Tough Stance at UNCTAD

Ramesh Jaura

THE West German government expects the forthcoming fifth UN conference on trade and development (UNCTAD V) at Manila to contribute towards further improvement in relations between industrial and underdeveloped countries. At the same time, Bonn is fully aware that the persistent North-South divide cannot be fully bridged. An official position paper states blandly: "It will be difficult to achieve substantial agreement on most of the issues."

Major issues to be negotiated in Manila are: structural changes in the world economy, growing protectionist tendencies, raw materials, the role of IMF, official development assistance (ODA), foreign private investments, indebtedness of under developed countries, code of conduct for transfer of technology, economic co-operation between the underdeveloped countries and the role of UNCTAD *vis-a-vis* GATT, World Bank and UN organisations like UNIDO.

On the controversial issue of raising West German contributions to the ODA to bring these at par with the UN target of 0.7 per cent of GNP, the official position paper maintains complete silence. This is not surprising in view of the fact that differences among cabinet members have led to a postponement of the decision on the extent to which Bonn would raise concessional aid in the coming years.

Both Economics Affairs Minister Lambsdorff and Minister for Economic Co-Operation Offergeld have assured that West Germany would raise its share of ODA contributions. But Lambsdorff, who will represent Bonn at UNCTAD, makes no bones about the fact that the UN target will not be fulfilled. The reason: continuous oil price rises. Bonn would, in fact, like the underdeveloped countries to persuade the oil producers not to go on periodically increasing prices.

West Germany has been facing strong criticism from within and outside for lagging behind the UN target with its meagre share of 0.27 per cent of GNP. The need to raise ODA and its importance for the North-South dialogue was stressed at the recent parliamentary hearings on the subject.

If the West German government did not decide on the doubling of the present concessional aid, this was as much due to the political difficulties involved in raising the taxes as to the fact that Bonn continues to give priority to trade. Besides, any additional funds available will be needed for "the rescue operation" in Turkey and "the flank support" to Egypt.

But Egypt and Turkey need not stand in the way of meeting the UN target of ODA if money going into arms build-up could be diverted to concessional aid. A suggestion to this effect has been made among others by the three-in-one chairman of the SPD, Socialist International and North-South Commission, Willy Brandt. But then what a former chancellor proposes, the compulsions of *realpolitik* imposed on the chancellor in office dispose. Besides, diversion of funds to developmental projects is not something on which Bonn alone can show the way.

Nevertheless, as at the Nairobi session three years ago, alongwith US and Japan, West Germany would have to face criticism at Manila, and not only on the issue of ODA. The underdeveloped countries have been demanding an increase in their share in respect of production, consumption and international trade. To achieve this, they favour a structural change in the existing international economic order. West Germany is not only sceptical about the structural changes, it also rejects exclusive responsibility for such changes. West Germany also rejects the underdeveloped countries' view that UNCTAD should be involved in the task of shifting the production capacities from the industrial to the underdeveloped countries. The idea of vesting more powers in the UNCTAD is opposed on the plea that this would intrude upon the role assigned to GATT. The demand for a greater say for the underdeveloped countries in the decisions concerning disposal of IMF funds is also turned down by West Germany and other industrial nations. Their plea is that new, long-term development-oriented IMF facilities are an issue on which the Fund alone can decide.

Another demand of the underdeveloped countries aimed at freer access to capital markets and provision of a multilateral system of guarantees is also rejected by the industrial nations. Bonn's view in this regard is that the West German market is in any case open for all those countries whose solvency is not in doubt. Those lacking a proven solvency must look elsewhere for credits.

Serious differences also exist in case of the controversial code of conduct relating to [illegible] ogy. West Germany and other developed countries insist that such a code has to be voluntary and not, as the underdeveloped countries demand, legally binding. Within the framework of existing institutions, industrial nations are prepared to accept a general scrutinising mechanism.

Another issue of friction is the growing protectionism against semi-finished and finished products from the under developed countries. West Germany is one of the few countries which has taken up a determined stand against protectionist tendencies in the EEC. Bonn aruges that there is no alternative to liberalised international trade.

In fact, West Germany is expected to counter the criticism for lagging far behind the UN target of ODA by stressing its commitment to liberalised trade. According to West Germany only if attempts are successful in opening the markets of industrial nations to products from poorer countries will the free market economy have proven its worth.

The significance of trade with the industrial nations for the economic growth of the underdeveloped countries cannot be minimised. But unless the industrial nations are prepared to give further concessions, with a view to fulfilling the poorer countries' demand for a new international economic order, the confrontation between the rich North and poor South cannot be avoided. This view was supported at the recent parliamentary hearings in Bonn on development aid policy.

World Trade in Cereals

WORLD trade in wheat and coarse grains will reach 151 million tons in the 1978-79 crop year, according to the latest forecast of the UN Food and Agriculture Organisation. This is only 0.5 million tons below the record level reached in the last crop year (July/June). Although imports of wheat and coarse grains by developed countries are expected to fall because of smaller requirements of the Soviet Union and the European Community as a result of record domestic crops, imports of grains by developing countries are forecast to jump by 9 million tons, about 14 per cent, mainly as a result of increased imports by China, which has now become the world's second largest grain importer. World trade in wheat should reach 71 million tons in the 1978-79 crop year, compared with 71.2 million tons in the 1977-78 season. Trade in coarse grains is forecast at 80 million tons, almost the same as the 1977-78 total of 80.3 million tons.

Account of Political Bargaining

Hitesranjan Sanyal

Non-Co-operation Movement in Indian Politics (1919-1924): A Historical Study by B M Taunk; Sundeep Prakashan, Delhi, 1978; pp 239, Rs 60.

IN this volume B M Taunk has given an elaborate account of the Non-Co-operation Movement, 1920-22. He has explored various sources of information (vide the impressive bibliography at the end of the volume). The data gathered from these sources have been arranged in a chronological order. At the beginning the author has traced the origin of the idea of Non-Co-operation as a technique of political action. Then he has given a detailed description of the incidents that had occurred during the Non-Co-operation Movement. In the course of the account of the movement the author has dealt with several important points, such as Hindu-Muslim relations in India with reference to the Non-Co-operation Movement, the different types of response that the call for non-co-operation with the government had evoked in the different strata of society, the different forms that the movement had assumed in the different parts of India and the participation of the masses in the movement on economic demands. With these features, Taunk's account of the Non-Co-operation Movement is more comprehensive than the account of the movement given in the standard works on the freedom movement in India namely, "History of the Indian National Congress, 1885-1935" by Pattabhi Sitaramayya and the "History of Freedom Movement in India", III by R C Majumdar or in the official publication entitled "Confidential Report on the Non-Co-operation and Khilafat Movements". It is for this reason that Taunk's book may be considered useful to students of modern Indian history.

In the last chapter the author has analysed the Non-Co-operation Movement in terms of its positive and negative aspects and has clarified his assessment of the character of the Movement. According to the author, the Non-Co-operation Movement "was purely a method of political protest and expression of indignation of a subject people against the wrongs that had been inflicted upon them by the foreign masters and Mahatma Gandhi attempted to conduct it on a high moral plane" (p 153). The author has not said much about the moral aspects of Gandhi's leadership. He has evaluated the Non-Co-operation Movement as a political phenomenon only.

There is a general tendency among the scholars of Gandhian studies to isolate one or the other feature of Gandhi's personality or of his activities and concentrate on it. This tendency has led to exercises in high philosophy (even metaphysics) or in detailed psycho-analysis or has resulted in conventional accounts of political bargaining between the British government and the leading Congressmen. Generally scholars have tended to overlook the fact that Gandhi wanted to effect a basic change in the social environment of the country. He had developed the idea of a non-violent society based on voluntary co-operation between self-relying villages which will constitute the primary units at the basic grass-roots level. The alternative social order envisaged by Gandhi involves a particular type of technology, new systems of production and distribution and a new power structure all of which will remain under the direct control of the people.

To this end, Gandhi had contemplated comprehensive mass movements emphasising the technology of khadi, national education for educating the people in khadi and the technique of co-operation, arbitration of disputes at the local level and the fight against social evils like untouchability and resistance to violence as represented by centralised authority at different levels. Gandhi believed that co-ordinated efforts on this line will lead the people to the achievement of swaraj by which he meant a non-violent society in which social, economic and political power will devolve on ordinary men who on their own will combine into panchayats for managing the available resources for the common interest of the different panchayats. This is why the constructive programme and the political programme are complementary to each other in the Gandhian concept of mass movement. Political programmes like Non-Co-operation or Civil Disobedience were conceived as the means of resisting the violent organisation of the state which under the control of the British had concentrated immense power in its hands or of any other authority which encroached upon the rights of the people. The constructive programme was meant for preparing the people for acquiring swaraj and retain independence through the organisation of panchayats.

One may not agree with what Gandhi wanted to do and discard his idea of swaraj in a non-violent society. But it is a mistake to dissociate the political movements led by Gandhi from the broader Gandhian movements for swaraj and treat the Non-Co-operation or the Civil Disobedience or the Quit India Movement as the Indians' struggle for acquiring sovereignty by ousting the British. Taunk has taken notice of the constructive programme which was launched along with the Non-Co-operation Movement. He has also shown that the movement had led to mass upsurge in several places throughout the country: there occurred unrest and strikes in industry and refusal to pay taxes and obey authority in the villages. But the author has not explained the significance of the constructive programme. Nor does he identify the particular features in Gandhi's programme that had inspired the ordinary people in the villages and cities. Non-Co-operation Movement which marks the beginning of the Gandhian movements on an all-Indian scale was begun with the call to the people to organise themselves for their swaraj. The Gandhian concept of swaraj had reached the ordinary people in course of the Non-Co-operation Movement. The mass

appeal of the Non-Co-operation Movement was accentuated by religious considerations which had come to be associated with the movement. But the religious question was relevant to a particular section of the participants. The majority of the participants were not concerned with it. Apparently Gandhi's idea of swaraj had appealed to the ordinary people who had found it relevant to their aspirations. Religious considerations did not constitute a factor of the Gandhian movement after the Non-Co-operation Movement was over. This may have been one of the reasons why a section of the participants had withdrawn from Gandhian mass movements. They may not have been convinced of the efficacy of the Gandhian idea of an alternative social system. But generally speaking, the appeal of the Gandhian programme of mass movement and his idea of swaraj had increased phenomenally between the Non-Co-operation Movement and Civil Disobedience Movement 1930-34. A comparison between these two movements in terms of the areas covered, number of participants and the initiative of the common people will bear out this point.

The study of the Non-Co-operation Movement therefore should have focused on the relevance of the Gandhian programmes and ideas for the condition in which the ordinary people of India were in and the process of mass mobilisation on the basis of these programmes. But instead of doing this the author has concentrated on the general political circumstances in which the Non-Co-operation Movement was launched and the immediate political consequences that followed from it. In other words, it is another account of political bargaining which may have been a part of the nationalist movements in India all through but certainly does not represent the spirit that had inspired the people to fight for their rights and the historical developments through which the freedom struggle of the people had progressed between 1920 and 1947.

Co-operative Farming

Kalyan Dutt

Some Problems of Co-operative Farming by S H Deshpande; Himalaya Publishing House, Bombay; pp vi + 196, Rs 26.

THE author tries to build a case against the "worker producer co-operative" of small farmers, which, according to D R Gadgil, is an "obvious and logical solution" to the basic problems of agriculture in this country. Citing various sources the author shows that the little success that co-operative farming has attained in India is due to large landowners pooling their lands and cultivating them with hired labour. This, however, is less of co-operative and more of joint stock capitalist farming. The author stands on solid ground when he castigates the government which disfavours capitalist farming on the one hand but fails to promote productivity through small farmers' co-operatives.

The main theoretical argument of the author is that owners of different sizes of land would refuse to pool their land and work together because this would involve a transfer of income from the rich to the poor. So far, so good. However, when the author comes to discussing the impracticability of small farmers' co-operative, each farmer owning *more or less the same size* of land, his arguments seem to be tenuous. His main argument in this connection is couched in the following words:

> One of the important conclusions of the Farm Management Studies is that if the services of family labour are priced at the market rates of wages for agricultural labour, the smaller families show a deficit in their agricultural business. ... Therefore, co-operatives of such farmers will not be in a position to afford for their members a fixed wage which is anywhere near the market wage. (p 46)

The reason why deficit appears in a small family labour based farm is that such farms, in order to maximise production, extend employment of labour almost to the point of zero net marginal labour product. But are there any reasons to believe that, when farms pool their lands and labour, the marginal productivity curve will not shift rightwards and be less inelastic? Pooling of land and labour is just not a horizontal adding up of marginal productivity curves. It leads to economies of scale, utilisation of indivisibilities, greater division of labour and opportunities for new technology. Not that the author is unaware of these factors but he seems to have belittled their significance without adducing sufficiently cogent reasons.

The author is, of course, perfectly right when he underlines the difficulties of management and of work incentives. A large farm may lure away labour from a small farmers' co-operative particularly in seasons when labour is short in supply. Co-existence of large capitalist farms with small farmers' co-operatives may not be a stable one. And this underscores the need for a radical land redistribution programme which the author has correctly noted.

This reviewer is in agreement with the author that by and large small producers' co-operatives will be impracticable in India if socio-economic conditions remain what they are. The problems of agriculture cannot be solved within agriculture. Hence the non-economic factors assume particular importance. The author could have made an important contribution if he had dealt with the non-economic factors that inhibit the growth of small farmers' co-operatives in India. The two chapters on non-economic incentives are indeed illuminating but they deal almost exclusively with the Israeli experience. The success of Israeli Kibbutzim is mainly due to aliens suddenly finding themselves confronted with a hostile nature. It is also due to the fervour of Zionism. The author quotes one of the pioneers of Kibbutdim as saying, "we knew that we needed one another's close and constant help because in the harsh conditions of the new country neither a person nor a family could stand alone" (p 154) Another pioneer says, "If I ask myself why at the time I selected Kvutza, then I must confess that it was not the desire to be a world reformer and also not because I was a socialist. But firstly and primarily because I was a Zionist and I desired to realise the Zionist aspiration in the Land of Israel." (p 154)

The progress of collective farming in the Soviet Union was likewise due to the hostility of kulaks against the toiling peasants and the Soviet government. No such hostility was evident in Poland after the Second World War and the country, socialist as it is, still retains a large extent of individual farming. In India, due to a variety of reasons, class struggles within the peasantry are still too dormant to provide an incentive for the small peasants to unite.

The book by Deshpande is excellent in style and rich in content and whether or not one agrees with him on all the points, one cannot but read it with interest.

Marx's Theory of Money

Amal Sanyal

Marx on Money by Suzanne De Brunhoff; Translated by Maurice J Goldbloom; Pluto Press; London; pp ix + 139, £ 2.70.

WRITTEN in the style of a monograph, this small volume looks, as is clear from its title, at Marx's theory of money. In the first part, the author discusses the way in which the question of money has been posed in volume I of "Capital" — the successive stages in the appearance of the general equivalent and its organic connection with the process of commodity circulation. The second part of the book discusses the role of money in simple and expanded reproduction, and also discusses the credit system as it appears in volume III of "Capital".

The thrust of the argument running through this monograph seems to suggest that the theory of money developed in the earlier parts of volume I is completely consistent with the schemes of (simple and) expanded reproduction as also with the phenomena of credit and its consequences for the capitalist economy. The author successfully demonstrates that there is no logical contradiction between the theory of money in volume I, and the discussion on credit as it appears in volume III. Regarding expanded reproduction, the author demonstrates that parallel to the value balances for the two departments, the monetary flow equations can be consistently written down, taking note of the role of money as an instrument of hoarding.

The author stresses that Marx's theory of money is not the theory of some money commodity or of gold money. Once this is grasped, the story of commodity circulation as represented to be interwoven with that of money circulation in volume I, can be consistently carried through in the analytical description of expanded reproduction as also of the phenomenon of credit. The author rightly stresses the identity between Marx's theories of value and of money, so that, she demands, the phenomena of credit, cycles and expanded reproduction be analysed not with reference to a commodity money but with reference to the *process* of circulation of commodities and money.

Accordingly one would have expected a discussion of the validity of the labour theory of value under conditions of capitalist production. Especially so, because the thrust of the author's arguments is to suggest that the theory of money developed in volume I valid for simple commodity production is logically consistent with circulation under a capitalist form of production. In fact, given the unity of Marx's theory of money and that of value, a discussion of the logical continuity of the theory of money between simple commodity production and capitalist form of production remains incomplete without a demonstration of the validity of the theory of value under the latter conditions. The author, however, has been silent on this very important question.

For one important reason, this omission seems to be rather serious. The author stresses the strict *logical* interconnection between the theory of money in simple commodity production and in commodity production under developed capitalist conditions. According to the author, simple commodity production is a useful abstraction basically used as a first *logical* approximation for the actual problem of analysing the laws of motion of a capitalist economy. The order in which the successive functions of money have been discussed in volume I of "Capital", the author claims, is an order necessitated by logic and the author explicitly denies any correspondence between this and the actual course of development in history. Similarly the journey through the volumes of "Capital", especially from simple commodity production to the capitalist form of production, is a logical exercise of moving from a higher to a lower level of abstraction, and thus has nothing to do with a simultaneous simulation of the essence of an actual historical process that started from simple commodity production. The author explicitly rejects, for example, Engels' views on the historical dimensions of the transformation problem.

Given this view, the importance of a discussion of the transformation problem assumes importance. If transformation does not have a historical dimension, then the labour theory of value itself becomes a piece of unnecessary wisdom, applicable only to simple commodity production, which, according to the author is but a logical category. As a result, neither does the labour theory hold, nor did it ever do so. It becomes almost a puzzle how on the other hand, the author could demonstrate that Marx's theory of money, which she herself admits is only the other side of his theory of value, is a valid tool for the analysis of the capitalist economy. The solution to the puzzle, of course, lies in the fact that the problems considered by the author — those of reproduction and crises — are generally aggregative, and the logical contradiction between the labour theory of value and an ahistorical view of competitive equilibrium under capitalist production conditions do not come out in such discussions.

If only the author had stepped out of these aggregative exercises, she would have discovered that there are only two consistent alternatives. One is to use categories of formal logic, define a competitive equilibrium accordingly, deny any historical dimensions to Marx's successive logical steps and to discover that the labour theory is an unnecessary construct, which has to be forgotten in discussions of an actual capitalist economy. The other is to use the Marxist method of defining categories from the very outset and use his dialectical logic. In particular, while discussing competitive equilibrium such method would prompt visualising an 'equilibrium' which is also *not* equilibrium in the sense that it contains endogenous reasons for its own change. This will completely justify the labour theory of value as a scientific tool of analysing an actual capitalist economy, but will also impart to the so-called transformation problem a historical dimension. As a consequence, the theory of money as well has to be viewed to have a historical dimension, consistent with Marx's general method.

Bayer

Bayer (India) Limited

Speech of the Chairman, Mr B M Ghia delivered on 2nd May, 1979 at the Twenty first Annual General Meeting of the Shareholders.

FRIENDS,

I have great pleasure in welcoming you to the 21st Annual General Meeting of the Company.

You have already received the Annual Report of your Company for the year ended 31st December, 1978 and with your permission, I shall take it as read.

Last year, I had expressed a hope that I would be able to give a still better account of the Company during the coming years. I am glad to inform you that the results of the year 1978 have come up to expectations. There has been an increase in the turnover of 24 per cent over that of the previous year. The profit of the Company for the year 1978 at Rs 55.36 million (Rs 39.07) showed a significant improvement. The provision for depreciation and for investment allowance reserve is marginally higher but the provision for tax is substantially higher at Rs 31.50 million (Rs 20.70 million). The overall result is a net profit of Rs 23.07 million for the year under report as against Rs 18.24 million in the previous year, which, I think, shows a satisfactory growth.

Your Board of Directors have recommended a dividend at the rate of 16 per cent (Rs 16 per share) subject to tax, for the year ended 31st December, 1978. You would have noticed a slight increase over the rate of 15 per cent paid for the year 1977.

As you are aware, the issued and paid up capital of the Company was increased during the year 1978 from Rs 78.45 million to Rs 81.10 million by issue of 17,500 new Equity Shares to the Unit Trust of India and 9,000 new Equity Shares to the employees of the Company. These shares are also eligible for dividend on a pro-rata basis. Your Directors considered it prudent to conserve the Company's resources for meeting the cost of investments envisaged during the current year. I am sure that you will appreciate that this decision is in the best interest of the Company.

You will be happy to note that all the three manufacturing plants and their respective marketing divisions have contributed towards the successful results achieved in the year 1978.

The Pesticides Division recorded a noteworthy growth of about 31 per cent over the sales of the previous year. In November, 1978 an Industrial Licence to manufacture 200 tons per annum of

Mr B M Ghia

Fenthion Technical (Baytex) within the existing licensed capacities was received. This product is expected to go on our production line during the current year. This production will be one more achievement in import substitution and will conserve foreign exchange for the country. The clearance for production of the new pesticide — TRIBUNIL — about which I had made a reference last year, has not yet been received from Government.

The growth of the Company's Rubber Division during the year 1978 was commendable. The implementation of the expansion project in 1978 made available a further increase in the installed capacity by 1,500 tons. In spite of the serious problems of inadequate availability and higher prices of natural rubber faced by the rubber industry, and despite increasing competition from other rubber chemicals manufacturers, this Division was able to achieve 19 per cent increase in its turnover.

The Pharmaceutical Division also increased its sales by 12 per cent over the level of 1977. All the capacities for manufacture of basic drugs, including Chloroquine Phosphate were fully utilised. According to the new Pharmaceutical policy declared in March 1978, the capacities will be regularised on the basis of the best of the last 3 years' production as on 31st March, 1977. We have made applications for Industrial Licences for certain new products which are under consideration of the Government. The future potential of the pharma market isquite bright.

I am also glad to inform you that your Company has maintained industrial harmony during the year under review. We have recently concluded agreements with the representatives of the Company's employees at the company's various offices which should go a long way in fostering the Company's progress during the coming years.

The results of thhe year 1978 would not have been possible but for co-ordinated efforts of the employees of the Company at all levels, the dedicated services of the distributors, dealers and other channels responsible for reaching the Company's products throughout the length and breadth of the country. We are specially grateful for the continued assistance from our Collaborators, Bayer AG, West Germany.

It has never been our policy to be complacent and I am hopeful that, we here at Bayer (India) Limited will continue to render a good report of our work during the years ahead and thus retain your confidence.

Thank you.

Fruits of Protectionism?

THE industrial countries' trade deficit in 1978 amounted to $ 25.4 billion or less than the $ 42.4 billion trade deficit recorded in 1977, according to the April issue of the IMF's *International Financial Statistics*. More than half of the improvement was attributable to the $ 8.7 billion increase in Japan's surplus, from $ 9.8 billion in 1977 to $ 18.5 billion in 1978. The Federal Republic of Germany's trade surplus rose from $ 16.6 billion in 1977 to $ 20.5 billion in 1978, while France's deficit was reduced from $ 5.5 billion in 1977 to $ 2.4 billion in 1978. Australia, New Zealand and South Africa raised their aggregate trade surplus by $ 886 million, to $ 4.1 billion during 1978. In January 1979, however, the industrial countries experienced a $ 10.1 billion trade deficit, largely because of deficits in France, Japan, the United Kingdom, and the United States. The deficit was the result of both increased imports and lower exports during the month.

The Marathwada Riots: A Report

Atyachar Virodh Samiti

The shocking experience of massacre, loot and rape of scheduled castes in Belchi, Agra, Pantnagar, Marathwada and Bajitpur, among other places, has demanded the attention of all humanist, progressive and Leftist forces.

It was as an attempt to understand the role of the caste system vis-a-vis *class struggle and class organisation that the Atyachar Virodhi Samiti was constituted.*

The Samiti sought, among other things, to highlight the nature and extent of repression of scheduled castes in Marathwada in Maharashtra and to draw lessons for future action which the scheduled caste masses, including poor peasants and agricultural labourers, may have to take when such attacks occur again.

With this objective in view, some representatives of the Samiti visited the riot-affected areas of Nanded, Parbhani and Aurangabad. What follows is a report of the visit.

I
Introduction

IN the last decade there have been brutal onslaughts on harijans (dalits)[1] on an increasing scale. The atrocities have occurred in all the states, irrespective of change of the ruling parties. Official estimates put the number of *recorded* cases of atrocities against dalits during Indira Gandhi's 'decade of development' (1966-1976) at 40,000. During the Janata Party's 19-month rule the figure has already exceeded 17,000.[2] The intensity of attacks, however, has been greater in Bihar, Haryana, Uttar Pradesh, Madhya Pradesh, Rajasthan, Maharashtra and Gujarat.

The shocking experience of mass-scale massacre, loot, and rape of dalits in Belchi, Agra, Pantnagar, Marathwada, Bajitpur, etc, has demanded the attention of all humanist, progressive and Leftist forces. It was to understand the role of the caste system *vis-a-vis* class struggle and class organisation that the Atyachar Virodh Samiti was constituted. Activists from trade unions and students' and teachers' organisations were part of the group, including five women activists. The Samiti was formed with a number of purposes in mind :

(1) To highlight the nature and extent of the repression in Marathwada and to draw lessons for future action which the dalit masses, including poor peasants and agricultural labourers, may have to take when such attacks occur again;

(2) To attempt to build links between the urban and rural workers, so that joint action and support on various issues could be extended;

(3) To draw the attention of the masses to the specific oppression and exploitation of women among the rural poor and to evolve a mechanism to combat jointly this continuous intimidation of women both sexually and as a class, particularly dalit women in this case; and

(4) To isolate and analyse the role of the reactionary forces and to explore the inability of the present political system to deal with these problems.

It was decided that these issues would be taken to the various sections the Samiti represented, and efforts would be made to mobilise and organise them.

Twenty representatives of the Samiti were to tour Nanded, Parbhani and Aurangabad. When the group reached Nanded station on October 1, 1978 it was threatened with arrest under Section 351 (relating to detention of "anti-social elements, professional goondas, and murderers"). After much discussion and argument, the police inspector allowed the Samiti to meet the Collector. It was finally settled that :

(a) all the members of the Samiti would be under "house arrest" at the Nanded rest-house for two days;
(b) a detailed list of the names and addresses of all the members, along with an itinerary, be submitted to the Police Inspector; and
(c) the Collector and the Superintendent of Police would have to be "convinced" of the motives of the group before permission could be granted to tour the area.

The Samiti was also informed that permission should have been sought from the Nanded Collectorate before leaving Bombay, and that the members should return to the district after one month. After wasting two days in long, fruitless discussions with the Collector and the Police, the Samiti decided to take the risk of going ahead with the original schedule without official permission. In almost all of the 48 villages visited, the police was already present and the tedious process of detailed interrogation of every individual member of the group was repeated time and again. We visited all the 48 villages dividing ourselves into teams of three with one local youth. In spite of police harassment, it was a very fruitful experience because we came away with a lot of information, insight and understanding. Here we give a report of our visit to the riot-affected areas of Nanded, Parbhani and Aurangabad.

II
Socio-Economic History of Marathwada

Geographically, Maharashtra can be divided into five regions — Vidarbha, Marathwada, Khandesh, Western Maharashtra, and Konkan. Marathwada has a total of 9,000 villages.

Marathwada, which is one of the most backward areas of Maharashtra with an area of 65,000 sq km, is divided into five districts — Aurangabad, Parbhani, Osmanabad, Nanded and Bhir. These districts are characterised by excessive dependence on agriculture, economic and industrial backwardness, absence of minerals, and low density of population. Marathwada was ruled for more than 200 years by the Nizam of Hyderabad and became free politically in 1948, after the Telengana movement.

Industrially these districts are very backward with only two major factories — sugar and cotton — which employ labour on a seasonal basis. While these districts depend excessively on agriculture, only about 4 per cent of the cultivable land is irrigated. Cotton, sugarcane, and jowar are the main crops.

TABLE: ATROCITIES ON HARIJANS, JANUARY 1-JULY 31 1978

State	Registered Cases of Murder	Registered Cases of Rapes
Uttar Pradesh	89	94
Madhya Pradesh	36	64
Bihar	41	58
Rajasthan	39	39
Maharashtra	7	14
Harayana	4	8
Gujarat	26	6
Others	21	23
Total	263	306

Source: National News Service.

There is a sharp differentiation among the rural population. On the one hand, there are the dalits who are usually landless labourers and poor peasants, owning about 1-2 acres of land, while on the other hand there are the Maratha zamindars owning 200-300 acres. Small holdings (less than 2 acres) constitute 24 per cent of all landholdings in the district.

Marathwada is not an industrial urban centre like Nagpur-Vidarbha and, therefore, the unemployment rate is very high. This is a severe problem for Marathwada. We see therefore, a growing phenomenon of educated youth going out of Marathwada to cities like Bombay where also there is little access to job opportunities. The severity of this problem can be seen in the increasing agitations by students in the cities of Aurangabad, Parbhani and Nanded, demanding speedy economic development of the region.

On March 23, 1974 nearly 2,000 youth came looking for jobs in Parbhani. When they arrived there, they were told that only 40 posts were to be filled. They then demonstrated peacefully to express their dissatisfaction and frustration. To suppress the agitated youth, police let loose repression and two unemployed youth were killed. In protest, in all the five districts of the region all political parties and students' organisations called for a bandh which was a total success. Students boycotted examinations in Parbhani district. This movement spread so rapidly that no examinations were held that year. The Naik government tried to create a split between the suvarna and dalit students, but the unity of the students was so strong that the government completely failed in this attempt.

The main demands of the Vikas Andolan ran along the following lines:

(1) The students felt that, as the ministers were generally chosen from districts other than Marathwada, the government of Maharashtra favoured other districts in terms of economic development. Because of this Marathwada was economically backward. Therefore, their demand was that a special minister should be selected from Marathwada so that the partiality of the state government to the other districts could be overcome.

(2) More loans and investments should be given by the state government to Marathwada for industrialisation, and new industries should be set up.

(3) The then ministry should be removed.

(4) Railway facilities should be expanded rapidly.

(5) Quick measures should be taken for economic development of the region.

Later, after the agitation, a minister from Marathwada was chosen, Shankarrao Chavan. But, despite this, Marathwada has remained as economically backward as ever.

DALITS IN MARATHWADA

In the total population of Marathwada, i e, 80 lakhs, 13 lakhs are dalits.[3] That means 16.25 per cent of Marathwada's population comprises scheduled caste people. Among them, 80 per cent are below poverty line.[4] The literacy rate of the scheduled castes is 19 per cent as against the general literacy rate of 35 per cent. Among dalits, the Mahar community is supposed to be relatively better-off and socially more conscious, and the percentage of literacy is also relatively higher. Mahars, Mangs, Chamars and Dhors constitute 35 per cent, 33 per cent, 22 per cent and 3 per cent, respectively, of the total scheduled caste population of Maharashtra.

As a result of the increasing influence of Ambedkar among dalits, especially among the Mahars, they enthusiastically made efforts to educate themselves. The Indian government also gave reservation facilities to the scheduled castes to compensate for their age-old oppression and exploitation. Yet, looking at the employment statistics, the picture seems very gloomy. In Maharashtra, the representation of scheduled castes in class I services is 1.5 per cent, in class II services it is 4.5 per cent, in class III services (clerk, typist, etc,) it is 7 per cent, and in class IV services (peon, sweepers, etc) it is 48 per cent.[5] Thus jobs of sweepers and scavengers are mainly reserved for dalits. Having a double impediment — of economic (poverty) and social oppression (discrimination and injustice) — the 20 per cent reservation in education and job opportunities does not make much dent in their problems.

Ambedkar's ideology greatly influenced the educated strata among the Mahars, and in Marathwada particularly the self-consciousness and self-assertion movement gained ground. Following Ambedkar, more than 50 per cent of Mahars accepted Buddhism. Ambedkar's People's Education Society attracted hundreds of dalit youth who later spread Buddhism and the 'Ambedkar movement' among the dalits of Marathwada. In villages also, this reform movement started spreading. They stopped begging from caste Hindus, started educating their children, and celebrated Ambedkar's and Buddha's birthdays (popularly known as Bhim-Jayanti and Buddha-Jayanti).

MARATHWADA RIOTS

Agitation, Atrocities and Its Aftermath.

The Marathwada riots were not at all spontaneous. They were well planned and organised by anti-dalits, mainly Marathas. On July 27, 1978 Sharad Pawar's government unanimously passed a resolution to rename 'Marthwada University' as 'Dr Babasaheb Ambedkar University'. The same day a bandh (closure) was declared against the renaming by the Students Action Committee in Nanded, Bhir and Aurangabad which was totally successful. There were demonstrations and attacks on public property in all the major towns such as Nanded, Aurangabad, Parbhani, etc. In the villages, the violence against dalits took many forms: "Killing of people, molestation and rape of Harijan women, burning of their houses and huts, pillaging their bustees, rendering them homeless, shunting them out of villages, polluting drinking water wells, killing of their cattle, refusal to give them work, etc".[6] This continued for 67 days. The Protection of Civil Rights Act did not come to the rescue of the victims.

The riots affected some 1,200[7] villages out of 9,000 villages of Marathwada. Nanded, Parbhani and Bhir were among the affected districts. The riots made 5,000 people of 1,000 villages homeless and shelterless.[8] It reduced 25,000 dalits into a totally demoralised, helpless condition;[9] 2,000 of them had to flee from their houses into jungles or cities. The terror created by the riots did not let the dalits go back to their villages in spite of starvation.

The well-planned offensive was led by caste Hindu capitalist landlords with their allies — police patils, sarpanches and goondas — who went on a rampage and took a toll of four lives.[10] All railway and state road transport was paralysed. A police sub-inspector was burnt alive. The violence, destruction and atrocities were not resisted by the police. Police and other government servants — "protectors of law and order" — were either passive spectators or actually participated in the attacks.

In Parbhani district alone, total loss of government and semi-government property was worth Rs 28 lakhs.[11] And the estimated loss of private property in Parbhani district is as follows :[12]

		(Rs)
(1)	On account of huts damaged	30,200
(2)	Household material and other property like bullock-carts, etc	2,19,475
(3)	Loss on account of damage to crops in encroached land	35,157
(4)	Damage to crops on allotted land	6,500
Total		2,91,332

We visited tension-gripped Nanded district. Nearly 50 villages were covered by our group of 25 persons. The Press had not considered it necessary to convey to the public even a fragment of the picture that confronted us there. Besides, as we stated earlier, we had to waste two days in futile argument with the police and the collector before we were able to reach the riot-torn villages.

In Sonkhed, Kandhar taluka, a landlord and his gang of hired men set fire on the dalit busti and raped two women agricultural labourers. In the resulting chaos, three dalit children lost their lives. In Sugaon, another village in the same taluka, Janardhan Mavde and his friend were murdered and twenty dalits were injured and hospitalised. A poisonous pesticide, Endrin, was poured into the well of the scheduled caste people. Janardhan was upa-sarpanch and had supported the Janata party during election, whereas the local rich peasant was a Congress member.

In Bolsa, Biloli taluka, a drunkard, Babu Potaji raped and tortured Janabai and Kistabai. The government had information as regards this incident, but no action was taken. In Pongu, a women who had given birth to a child just two days earlier, was raped by Ramanbabu of Bolsa. While all this was happening, the other dalits were fleeing to the jungle in terror. The inhabitants of Kushnoor were still too terrified to speak freely. The dalits had begun to run towards the forests as soon as the attack by the agents of the rural vested interests started. Four or five women were caught by goondas who raped them and burnt to death the small child of one of them. A scheduled caste Gram Sevak was assaulted and an attempt was made to burn him alive.

In village Yetala, two scheduled caste teachers, Zagde and Thatwad, were severely beaten up in the Gram Panchayat office. When they contacted the police sub-inspector, Dharmabad, they were told to behave like their forefathers. In village Temburni, one matang, Pochiram, was brutally murdered and some huts were burnt.

In Koklegaon, a dalit teacher had tried to raise social awareness among the Mahars. The Mahars also used to celebrate Bhim-Jayanti. The homes of all of them were burnt to the ground and the wife of the teacher was beaten up. Memories of brutal atrocities haunt the inhabitants of Izzatgaon. Four or five women who were running towards the forest were raped and the breasts of one of them were cut off. No case was filed against the criminals.

When we visited the Dalit colonies of Pangri, the police patil of the village came and spoke on behalf of the dalits. However, the fear on the faces of the silent dalits spoke more eloquently. After the meeting, we went out of the village with some of the dalits but even there we were followed by the agents of the police patil. Finally, we managed to speak to some dalit women working in the fields. Dautarbai Shatiba Lokhande said, "All the atrocities in Pangri were committed with the blessings of the police patil. There is only one well in the village. Most of the Harijans used to fetch water from a stream three or four miles away. But some of the enlightened dalits used to draw water from the well. Angered by this, the police patil egged on the caste Hindus, saying "What are you waiting for? Why don't you finish off the dalits? Throw their children also into the well."

A Gram Sevak named Vitthal Chaukoba of Samrala was not spared, even though he was a member of the village Panchayat. Fifty men, armed with lathis, acting on the orders of the village police patil, beat up both him and his wife and set fire to their house.

This is not the story of a few villages. The caste Hindu police patils and sarpanches of all the riot-affected villages teamed up with the rich caste Hindu landowners to attack the dalit poor-peasant and agricultural labourers.

In Korgaon, Kaulgaon, Nandgaon, Sodgaon, Halta, Cohgaon, Adgaon, Nandpur and a number of other villages of Parbhani district also, the same experience was repeated.

In Parbhani town, on July 27, 1978 Ambedkar's statue at Bhim Nagar was broken by caste Hindu students and youth. In Bhim Nagar, there are only 5 per cent Hindus; 80 per cent are Buddhist (Mahars) and 15 per cent are Muslims. Dalits were opposed to the name Kranti Nagar by which this area was originally known. So they burnt the board and replaced it with the board of Bhim Nagar. For this, five or six dalits were arrested. There was still police-patrolling when we visited the area, allegedly because there was 'tension' in the area.

In Nanded city, Etwara is a big dalit bustee surrounded by the dwellings of caste Hindus. Dalits have an Ambedkar library. During the riots, caste Hindus, with the help of the police, attacked the dalit bustee by throwing stones and attempts were made to burn the bustee. However, college students of the dalit bustee were prepared for such things. They, with the help of other bustee people, took action for self-defence and stood for hours together with buckets-full of water. Women also joined men in barricading the area.

After the riots, the rural Mahars who had left the villages were not ready to go back to their respective villages because of horror of atrocities resulting from caste frenzy. The educated, salaried strata looked cynical. Dalits in general had a feeling of helplessness while students and youth of the mass Movement and Dalit Panthers showed an urge to combat the casteist onslaught. Posters of the mass movement depicting atrocities on dalits in poetic and emotional language were seen in towns, sometimes also in villages. The dalit leaders also raised the demand for a separate Dalitsthan, which gathered momentum in the cities. In many villages, dalits were blaming student leaders of the cities. One villager in Kokalegaon told us, "They are giving fiery lectures, demonstrating in cities and here we have to suffer because the casteists retaliate by committing atrocities against us. At that time these dalit student leaders don't come to rescue us."

After the riots, when state help was being given for rehabilitation of the riot-affected dalits, there were many loopholes, like curruption by petty officials, (we ourselves saw an overseer at

a site thoroughly drunk) in Gaglegaon of Biloli taluka, dalit construction workers were not given their legitimate pay. One dalit of Hangergaon told us, "Sharad Pawar's government is talking much about rehabilitation. They will rebuild our shattered huts, we will work more and may be able to get back our corn, utensils. But our sisters and wives had to lose their dignity by being raped and sexually tortured. Are we going to get this back?"

In many villages, no landlord was ready to take Mahar agricultural labourers for work on their land. In the absence of corn or rice and money, the Mahars were merely surviving on custard apple (sitafal) collected from the jungle because even village Baniyas were not ready to lend them cereals or money. As a result of the reform movement, in many villages of Marathwada, the practice of untouchability was removed as far as the dalits' entry into hotels was concerned. In some villages, dalits and suvarnas were taking water from the same wells. But after the riots, dalits were not allowed to enter hotels, and even if they are allowed the cups and plates for the dalits are kept separate from those for the suvarnas.

In such a situation, what else can be there except cynicism and a sense of deprivation among the dalits? Babasaheb Ambedkar's and Lord Buddha's photographs were burnt, effigies of Babasaheb were burnt. For dalits, this act was the greatest insult to them.

There were instances of caste Hindus being attacked who supported the dalits in their villages. Mahajan patil from Kahala village, Taluka-Biloli was beaten and brutally attacked for supporting the dalits. There were many such incidents.

As *Voice* said in October 1978, "The situation as it appears, is full of dismay and sadness, yet the *Voice* has a feeling that this agitation has led to the hardening of attitudes and more militant positions."[13]

However, in the areas where Left organisations like CPI, CPM, CPI(ML) are active and were organising agricultural labourers and rural poor on a class perspective, violence did not take place. In Nanded district itself, in seven to eight villages, like Sujlegaon, Hangergaon, Borgaon, etc, where Kashtakari Sangathana (CPI-ML) was active for the past few years, dalits and suvarnas were jointly prepared to fight back the attack of caste-Hindu kulaks.

However, as a result of the ferocious attacks on the dalit population, the potential unity of the agricultural poor against the rural rich has been generally undermined. Wages in the countryside declined. Attempts were made to take back lands of dalits through more harassment. Moneylenders have benefited as a result of the requirements of the dalit population for rehabilitation. "In colleges, bitterness and caste hatred is likely to prevail for a long time to come between dalit and non-dalit students. Even on minor issues there is a great likelihood of physical clashes between students of different castes."[14]

Cause of Riots:

It is essential to understand why the attacks have occurred because the reasons are quite complex. It is very difficult to generalise because of the economic, social, cultural and ideological causes which all work simultaneously but in a different manner in different places. As patterns of atrocities were different in rural and urban areas they have to be analysed separately.

In the urban areas, the main cause was the high level of unemployment. Each year, thousands of degree holders come out of the university but find no place in the employment market. The 20 per cent reservation in jobs and education for the scheduled caste community was found to aggravate the problem of unemployment for the caste Hindu youth. In Marathwada, the Mahar youth are quite educated, and hence became a target. Renaming of Marathwada University as Dr. Babasaheb Ambedkar University was utilised to provoke the caste sentiments. "The Mahars are taking over... Today they have changed the name of the University, tomorrow Marathwada will be renamed as Maharwada". The Aurangabad Suvarna College students took out a protest morcha which was attacked by a large group of dalit students. It was mainly as a reaction to this incident that the division on caste lines took place. Certain politicians and traders, utilising the caste division carried the issue into other sections also.

However, renaming was only a pretext; the real issues were deeper. Most important was the reservation question. Suvarnas felt that dalits were getting preferential treatment as regards selection for jobs and seats in educational institutions; that dalits with 45 per cent marks were selected whereas suvarnas with even 75 per cent marks were rejected. However, surveys[15] show that though this may be true in a few cases, in general, reservation quotas are rarely filled and that suvarnas themselves make use of the quotas by getting false certificates. However, the resentment against reservations goes much deeper; the whole question of reservation must be seen in relation to the state of the economy today. In all sections the rate of unemployment is accelerating at an alarming rate. It is this situation in the employment market that is expressed as resentment against the reserved quotas for certain sections.

Another factor which determined the extent of atrocities was the policies and character of dalit movements itself and its leaders in particular. The dalit movement in Maharashtra during the late 1960s and early 1970s had sympathy of the government and Press. However, as the leadership did not politicise and guide the movement in any revolutionary long-term perspective, different groups of dalits emerged, led by different leaders owing allegience to various political parties. The behaviour of some Dalit Panther leaders themselves came under much criticism as did the use of crude and rude language by some sections of dalits. It was this old resentment, built up against the dalit organisations and leaders which found expression in some atrocities.

In towns such as Aurangabad there *is only a slight difference between* the urban and rural areas. There is close contact among urban and rural people through rural students who study in the towns, traders who trade and communicate regularly between the urban and rural regions, the rural rich and the politicians who have business and other close contacts in the urban centres etc. Also, the separation between the thinking rural and urban elites is not great at all. Thus at levels — political, economic, social, ideological and spiritual — fairly close and regular links are maintained between these two sections. These are the main reasons why the riots spread to the rural areas in such a short time.

In the rural areas, the causes of the riots were many and varied. It is difficult to pin down which are the most important causes. But the primary cause seems to be the feeling that the increasing unity among the dalits themselves and between dalits and suvarna agricultural labourers had to be broken — although this unity may have been only at an initial stage. Various dalit and other organisations had played a role, though admittedly a small one, in creating some awareness among dalits

about the necessity for organisation and unity. Also, during the Emergency there had been some unity among different castes and dalit agricultural labourers. In Nanded district, the Kashtakari Sangathana (Organisation of Exploited) had developed fairly rapidly and, within two years had built up a fairly strong organisation in 12 to 15 villages of Biloli taluka. Both dalit and suvarna agricultural labourers, poor peasants, and some rich peasants occupying land of 70-80 acres also belong to this organisation. In these areas, suvarnas actively helped the dalits during the riots. Thus, in some villages, self-defence committees were formed of both suvarnas and dalits and country-guns and bombs were made. Even where the Kashtakari Sangathana was not physically present, labourers had heard of its activities and militancy and had started becoming somewhat conscious It was partly to break this newly formed unity that the atrocities were committed in Biloli taluka Balwant Rao Chavan, one of the leading figures in the riots in Nanded declared in a public meeting: "I shall see that Raja Marathe and his Kashtakari Sangathana are thrown out of Nanded". Some individuals leading the atrocities told some members of this organisation that the aim was to break the growing unity and awareness of the dalits to demoralise them enough not to unite and also as a warning to the suvarna labourers and against unity in the future.

Various groups and organisations have led some struggles in the villages in recent years. Agitations and struggles on wage and land issues were organised. Some agitations on Baba Adhav's slogan "One village, one well" had also been carried out. Wherever such struggles and agitations had been organised, but where there was no strong organisation of dalits, the atrocities were greatest. In areas where some surplus land had been distributed to dalits, the attacks were of great intensity. Suvarna landlords and rich peasants also resented the fact that some dalits were getting educated. In fact, atrocities also took place where the dalits had somewhat improved their standards of living.

Another very important factor was the influence of Babasaheb Ambedkar and his role in increasing cultural and social awareness mainly among the Mahars As Ambedkar himself was a Mahar, his influence on the Mahar section of the dalits was much greater as compared to the Mangs and other sections. So we find differential educational levels among Mahars and other sections of the dalits. Mahars were giving up traditional jobs of sweepers, scavengers, etc, and were coming in to service sectors such as banks, LIC, government jobs, educational institutes. However, only a microscopic minority of dalits could avail of such opportunities.

As a result of the increasing awareness among the dalits, their supports to different political parties also underwent changes. Some dalit leaders came out openly against the Congress and Congress (I) and campaigned for and supported the Janata. Old political allegiances were somewhat changed, and some dalits did not now vote for whoever their landlords supported. These dalits were attacked in revenge and also as a warning to other poorer sections that they should not do the same.

Various other secondary factors were also present — old feuds, goondaism, personal enmity, etc

In Nanded district, there is flourishing cotton trade. As a result of the introduction of monoply cotton procurement scheme, by the Sharad Pawar government, cotton merchants and traders were very angry. They generously supplied money to the rioteers in the cities and small towns like Nanded, Muked, Degloor.

"As the economic and political crisis in the country deepens, a section of ruling classes are bound to report to more such issues (e g, language issue in Tamil Nadu, separate Telengana in AP, reservations in Bihar, communalism in Gujarat, Aligarh etc, caste issue in Marathwada, Bihar, Agra, ec)."[16]

Role of Political Parties, Organisations, Press, Intellectuals and State Machinery Such as Police, Law, Administration:

Happenings during the Marathwada caste riots exposed the real nature of all political parties, organisations of students, dalits, humanists and liberals, Press, intellectuals and elites, and the state machinery. We got ample opportunities to get first-hand information as regards these in our 12 days' stay from September 30 to October 11, 1978, in the riot-affected areas.

During 1977, when Dalit Panthers started the agitation to rename the Marathwada University as Dr Babasaheb Ambedkar University, student organisations with different political inclinations, such as ABVP, SFI, AISF, YKD, and the Students Action Committee wholeheartedly supported the agitation. Not only that, even the Executive Council of Marathwada University unanimously passed a resolution in favour of the renaming.

On July 27, 1978, Sharad Pawar's government moved a resolution renaming Marathwada University which was unanimously adopted by both Houses. The same day, the Students' Action committee dominated by Maratha youth started the agitation *against* renaming. Cotton merchants lavishly financed the agitation. In Nanded, Kurundkar, Principal of People's College gave the theoretical framework to support the agitation.

The atrocities were inflamed also by the Congress (I) which propagated that the cotton monopoly and the renaming were consequences of Janata rule.

Maharashtra Dalit Panthers' secretary, Gangadhar Gade, said: "to rename Marathwada University as 'Babasaheb Ambedkar University' is the question of Dalits self-consciousness and all the dalit brothers will unitedly fight for this struggle".

"Under the pretext of renaming, there was a collective and pre-planned attack on the dalits", said the Yukrand in a letter to the Governor.

B D Kobragade of the Republican Party demanded that, "like Banaras Hindu University and Aligarh Muslim University, the Central government should also make Marathwada University as Babasaheb Ambedkar Buddhist University".

"Growing unemployment among caste Hindus and resentment at the scheduled caste youth having a better standard of living than they had before probably irritated them", said S M Joshi.

When Vasantdada's Congress government was in Maharashtra they had theoretically supported the various dalit organisations' demand for renaming of Marathwada University. After the PDF government came to power, it too was quick to support the renaming demand. Noticing the strength of the Janata party in PDF government, it is easy to understand its stand on renaming. With an eve to the dalit votes its aim was to loosen Indira Congress's hold on the dalit population.

The Nanded city Janata unit, which is dominated by traders, passed a resolution supporting the agitation. The Janata party workers and lawyers in Degloor, Biloli, Mukhed gave statements in newspapers supporting the agitation and formed so-called vidyarthi kruti samitis in these small towns.

Prominent leaders of the Congress party, who are rich peasants with 150 to 200 acres of irrigated land, were

attacked the dalits in Nanded district. Balvantrao Chavan and Hanumantrao of Biloli taluka engineered the worst kind of atrocities with the help of hired goondas and their relatives. They organised the attacks with the help of scooters, tractors, jeeps, etc, and their goondas were armed with spears, axes, bamboos, cycle-chains, etc.

A peculiarity of this agitation was direct participation of landlords in the agitation; they took part in processions, organising meetings, etc. In village Kolheborgaon, the chairman of co-operative society physically took part in the procession to burn Ambedkar's effigy. In village Avrala, a kulak occupying 150 acres of land of Hanumantrao of Hangergaon stood by with his gun.

In Kandhar taluka, the Peasants and Workers Party MP Dhondge, supported the agitation. It was well known that a defeated candidate Sambhaji Patil Umrekar actively supported the agitation. Trucks of the Kalambar Co-operative Sugar Factory, of which he is chairman, were used to transport goondas from one village to the other. In Bhokar taluka and Nanded taluka, the zilla parishad president Sahebrao Baradkar was actively involved in intensifying the agitation. In many places while successfully committing atrocities, goondas were shouting slogans 'Vasantdada Patil zindabad'.

The RSS opposed the renaming[17] and many RSS members were part of SAC. *Voice* said: "An influential socialist in Marathwada chose to actively support the agitation and suggested that separate university be given to dalits." CPI's position was ambiguous. In their Manmad conference, they condemned atrocities, while at the regional level, V D Deshpande opposed renaming and supported the agitation. At the state level the CPI condemned inaction of the police and supported the demand for renaming; the Lal Nishan and CPM also supported renaming but could hardly do anything when the massive onslaught on the dalits was on. Peasants and Workers Party also showed the same inconsistency as that of CPI. At the state level, PWP took a stand favouring renaming, but at the regional level, large numbers of its members opposed renaming. Except CPM, CPI (ML), and Lal Nishan, all political parties took opportunist positions.

In Aurangabad, when a Marxist lecturer Dasarda openly condemned atrocities committed by the Students' Action Committee and supported the renaming of Marathwada University, he was beaten up by SAC's members. Nobody came to his rescue, not even the Mahars.

Marathwada Nagarik Samiti played a most dubious role. MNS is popularly known as a committee of "Shethaji, Bhatji and Latji" — meaning, thereby, committee of businessmen, 'big' people, Brahmins, etc. MNS perpetuated the ideology of hatred and viciousness towards dalits. It not only justified the agitation, it also actively mobilised higher-caste Hindus. During the riots the vengeance of the MN Samiti's caste chauvinists came to its fore. They focused on the "irresponsible, arrogant, crude" behaviour of the dalit leadership, the reservation issue, "misuse of Protection of Civil Rights (PCR) Act by dalits".[18]

On July 27, 1978, SFI gave a press statement welcoming the renaming of the University.

The dalit leadership whose existence depended on one or the other ruling-class parties were in a very difficult position: they were neither able to give dalit masses any kind of support nor could they help them to resist the attack. Dalit Panthers and mass movement put forward a demand of separate 'Dalitsthan'. On July 29, 1978, the Dalit Panther leader, Arun Kamble, gave a press statement appealing to Dalits to maintain peace.[19] Next day, Yukrand, SFI and Yuvak Republicans, also gave the same kind of press-note.[20] Then a Sarvodaya activist went on an indefinite fast for the establishment of peace.

Janata Youth Morcha, with pro-Jan Sangh inclinations, and the Peasant Youth Army, supported the agitation by SAC. On August 4, *Marathwada*, a Marathi daily, published: "Freedom fighters support agitation". In Aurangabad, medicos also went on strike to support the agitation.

When we asked P V Ranade, noted historian of Aurangabad University, about his views on the Marathwada riots, he told us, "The entire episode was government-sponsored. Whenever the ruling class wants to have a riot, they have it. But the period of riots was a very trying time. Everybody had to come out with their clear-cut stand".[21]

During the riots, teachers did not play the role of establishing peace. Many professors and academicians supported the agitation. Kurundakar, Govindbhai Shroff, etc, openly supported the agitation. When Desarda, a Marxist teacher, openly welcomed renaming, he was beaten up by Maratha students. Regarding teachers, *Voice* says: "The organised associations of teachers in the region failed to play any positive role."[22] After the riots were over, some college teachers and academicians such as Avinesh Dolas, Nagnath Kotapalle, M D Pandye, Balchandra Nemade, etc, formed Aapadgrasta Dalit Sahayyak Samiti[23] "with a view to helping the riot-affected dalits in their rehabilitation and cementing the gap between the dalits and the caste Hindus".

As for the part played by newspapers, Nanded city's newspapers, *Godatir Samachar* (pro-Congress) and *Parajacan* (pro-Janata) supported the agitation by giving wide publicity to riots in the cities and suppressing the news of atrocities in the rural areas. They refused to publish any statement by the Republican Party of India and Dalit Panthers. The Aurangabad daily, *Marathwada*, opposed the renaming on the grounds that it violates the cultural identity and entity of Marathwada. It supported the agitation in its editorial of July 29, 1978.[24] Editorial of August 1, 1978 said: "The agitation has been spreading in the villages. Nowhere should the agitation become violent or communal ... we urge citizens of all districts and areas to stop to remain onlookers and actively support the agitation and help maintain peace and order."[25] Said *Voice*: "The press of the regional language had chosen to side with the agitators and projected it as a 'people's' movement with all spontaneity attributed to it."[26] Even Maharashtra's Chief Minister had to admit that the Press has given only one-sided picture meaning thereby that there have been villages in which dalits have been protected.[27] In our personal talk with Balchandra Nemade, on the role of Press propaganda, he told us, "All Marathi newspapers are communal and they thrive on the so-called 'freedom of Press' to serve their own aims".[28]

Our investigation revealed that the state machinery was totally unable to protect the dalits. In all these villages, where atrocities took place, the Sarpanch and the village police patil have been either involved actively in organising the attacks or have blessed the goondas to commit atrocities. Desarda, a Marxist lecturer of Milind College told us: "The government connived with the agitation and supported it".[29] They not only watched, as a silent spectator, the destruction of public property, burning of railway wagons and railway stations, damage to roads and state transport systems, but also made statements to the Press that the situation was quickly regaining normalcy — while in Bombay a demonstration of dalits was teargassed and in the Nagpur firing (on a morcha of

actively involved in the agitation and dalits against casteist riots) five dalits were killed. Dalits were the victims of caste Hindu chauvinists and of the police at the same time.

"In Nanded city sons of Resident Deputy Collector, Home Inspector, and Circle Inspector were involved in the agitation. At a time of curfew in the city, they were stopped by some home-guards belonging to scheduled castes and they retaliated by filing a police complaint against the homeguards."[30]

III
How Do We Look at the Marathwada Riots?

For the purpose of understanding and analysing the objective situation realistically and basing future action and organisation on this understanding and analysis we have to define, identify and isolate the role of caste and the extent of class-consciousness involved. The first step would be to define caste. The caste system is generally understood to be a system of division of labour according to the different functions to be performed. Actually, it is something more. The caste system functions both as a relation of production and as an ideology.

Caste as a Relation of Production:

The caste system functions as an extremely effective method of economic exploitation. The class which has economic power also acquires political power and social prestige which help it to perpetuate, consolidate and justify its position in the hierarchy. Caste hierarchies also reflect ownership of land.[31] Economic hierarchy is closely linked with social hierarchy.[32]

Thus caste determines a definite relation to the means of production and subsistence especially in rural areas. As bourgeois relations develop the institution of caste starts disintegrating, but the process is not so smooth. In between, many caste riots reflecting conflict of class-interest took place. The anti-Brahmin movement of Maharashtra in the 19th Century being one such example. As a result of the policies of the British government, and later Indian government, the rise of the Marathas as the dominant caste took place.

Caste must be understood as a hierarchy rooted in the relations of production.[33] Caste controls the access of groups and individuals to the conditions of production and to resources[34] and provides the social framework for politico-ritual activity. It is a system of relations of production regulating the rights of groups and individuals with respect to the means of production and access to the surplus.

Caste as an Ideology:

"The caste system is not merely division of labour. It is also a division of labourers."[35] Capitalist relations make agricultural and industrial labourers into a distinct class in itself, but the caste system prevents them from being a class-for-itself.

The ruling ideas of an epoch are the ideas of the ruling classes who, by the fact of their control over the production of means of subsistence, also control the production of ideas which of course serve the creator. The relations of production are maintained in a way that capitalist exploitation continues with feudal oppressive means of extracting highest possible surplus from the exploited masses by feudal modes of servitude, perpetuating caste-division etc. The system reproduces itself and the ideology provides the rationale for maintaining the *status quo*. One of the worst things with the caste system is endogamous relations. Moreover, 'untouchability' being institutionalised for ages, has been the most inhuman and savage reality.

The legitimacy of class/caste structures is provided by the Brahminical world-view, i e, dharma and karma of the four varnas (Brahmin, Kshatriya, Vaishya and Sudra) — i e, do the duty assigned to you and do it well or else God (or "his representatives the Brahmins") will punish you. Therefore, caste and religion are used to perpetuate a particular class-structure.

We now have to understand why the caste system persists till today. In India, capitalist relations and bourgeois ideology, to a considerable extent implanted by the British broke up stagnating and self-sufficient village communities and the process of destruction of the traditional mode of production and division of labour started. But, in the villages, this process was taking place extremely slowly. In a "mixed capitalist economy", rural-urban disparity in economic, social, and cultural spheres always remains. Caste thus persists as a part of feudal ideology. Even though the relations of production may be undergoing changes the ideological superstructure acquires certain rigidity and takes a longer time to change. The ruling class tries its utmost to see that no ideological change takes place because the stagnation helps them to maintain their control. The stability of the State depends to a great extent upon the "perfection of institutional structures that protect the ruling classes from confrontation with coalitions of alienated commoners"[36] (a) institutional structure that controls the content of ideology, e g, caste, religion, communal sentiments, education etc, and (b) institutions that physically suppress, e g, police, law, etc.

One of the latent functions of the caste system clearly has been to prevent formation of consciousness and struggles on class lines with any commonality of interest or unity of function. This function is one of the main reasons for its persistence.[37]

Thus, in the superstructure there is an alliance of the caste (feudal) ideology and bourgeois ideology — both coming to a 'compromise'. 'Divide and Rule', one of the most effective tools in the hands of the bourgeoisie, is seen

in casteism, communalism, regionalism, and the language issue. Caste is then used as a mechanism of oppression, particularly for keeping labourers from uniting on the basis of common class interests (as also racism and ethnocentrism).[38] The various conflicts and tensions in society are "conflicts between the different social classes which stem ultimately from the social relations of production".[39] The cross-cutting of caste by socio-economic class in one of the important factors used by the upper classes to obstruct the development of class consciousness and class-based movements.[40] Caste has thus been made to serve new functions, but the new function so closely resemble the old that it is sometimes difficult to distinguish between them.

"Richer upper castes behave in such a manner that poorer members of their own castes believe that the benefits of upper caste status are greater than they really are, i e, the rich prevent their own poor from believing that any benefits might be achieved by aligning with poors (of their class, other caste) Harijans on a class basis."[41]

Then, in such a complex situation what role have Left parties and groups played? Here, Gail Omvedt rightly points out, "if caste remains the main barrier to class-unity the failure of the Left to build democratic anti-caste movements or relate constructively to such movements when they arise among the low castes themselves"[42] is responsible — as a result of which, "the attacks on Orthodox Brahminic Hinduism and the efforts to build an alternative democratic and usually more secular culture have been ignored".[43]

Now, having the experience of caste-riots of Marathwada, Bajitpur, and Bihar, all Left and progressive forces will be forced to take clear-cut stands on crucial issues such as those of (a) Dalitsthan (b) Reservation. On what basis — caste or class?

IV

Conclusion

Caste is one of the most important aspects of the Indian society. It represents a specific form of oppression at the level of relations of production. To say that there are only class issues, nothing like questions pertaining to caste, is totally absurd, because of the material reality that "caste divisions beyond purely 'economic' classes"[44] yet persist. So, issues around specific caste questions must be taken by all progressives and Leftists, dalits and non-dalits and organisations. Autonomous dalit movement with democratic demands and struggles against caste discrimination and caste oppression are totally justified and should be supported unconditionally. To establish a link between fights against caste-oppression and class exploitation is a need of the hour.

Notes

[The Atyachar Virodh Samiti thanks all those who contributed generously to make our visit a possibility and a success.]

1 We use the term 'dalit' and not 'harijan' as it is a more effective expression of economic exploitation and political, social and cultural oppression of the weakest section of our society.

FAO's Report on World Agriculture in 1978

CROP and livestock production as a whole rose by almost 3 per cent and cereal output by almost 5 per cent to a new record level. Carryover stocks of cereals — excluding China and the Soviet Union for which data are not available — continued to increase during 1978 and are expected to reach 205 million tons by the close of the 1978-79 crop season, representing 21 per cent of annual consumption in the countries concerned. Official commitments of external assistance for agriculture in the underdeveloped countries, which in 1977 exceeded the 1975 peak by 12 per cent in real terms, appeared likely to go still higher.

In other respects, however, 1978 was a disappointing year. The largest expansion in food production was in Oceania, Europe and the Soviet Union. In many of the underdeveloped countries not much progress was achieved in boosting production.

...s the World Bank Serve?

Joseph Collins

Frances Moore Lappe

The World Bank is not simply a provider of development loans. Over the past few years it has become a major force shaping the economic policies of various countries.

The Bank has been establishing permanent missions in underdeveloped countries, often located right within planning ministries. In an increasing number of countries, the Bank puts together and chairs a consortium of the principal bilateral and multilateral lenders that co-ordinates donor contributions and policies. One trump card of the Bank is that it determines governments' international credit ratings.

Loans go increasingly to the world's most repressive regimes, those willing to implement fiscal measures dictated by the Bank — measures that penalise workers and peasants. Four countries which have experienced military take-overs and martial law since the early 1970s — Argentina, Chile, the Philippines and Uruguay — will receive a seven-fold increase in World Bank lending by 1979. Loans to all other borrowers will increase only three times.

Perhaps more than any other institution in the world, the World Bank is helping large numbers of people move out of absolute poverty toward a more decent life

— World Bank President
Robert S McNamara, April 2, 1978.

THE World Bank has rapidly emerged as the lending institution for development financing, with lending commitments for 1979 projected at $9.8 billion, US President Carter has asked American tax-payers to virtually double their contribution to the Bank. The United States's $2.2 billion in fiscal 1979, we are told, would help the Bank further its 'assault on poverty'.

World Bank's Assault on Poverty

Important insights into the World Bank's battle-plan can come from reading any of its confidential rural project planning documents ('gray covers'). Here the Bank staff seem to follow a ritual formula—one apparently unaffected by the Bank's 'basic needs' rhetoric of the past five years.

Technical and statistical data are paraded. Poverty is quantified. The poor are spoken of in para-military terms, such as 'the target population'. Despite the stress on 'participation' in publicly-touted policy papers (for example, "The rural poor must participate in designing and operating a programme which involves so many of them"), poor people, project documents imply, can be reached from the top down. The poor are never seen as the participants, much less the instigators, of their own development.

Project proposals, nominally written by the local government, are in most cases ghost-written by Bank 'missions' that fly in — at no small expense — from Washington for a few days. The presumption throughout the project design is that development can be achieved only by bringing in external resources. Foreign investment is thought of as essential. Everything should be done, therefore, to develop a favourable climate for foreign banks and corporations. That a project design includes ongoing reliance on imports is not seen as a problem.

The project implementation section amounts to a series of best-of-all-worlds projections. Statement of goals plus money equals success. Poverty is simply *there*, with no hint that forces are at work creating and sustaining it. A project plan is an exercise in economics, divorced from political, sociological and cultural factors. The possibility of conflicting interests on any level is apparently unthinkable. Government and other actors are all presumed to be working together to eliminate poverty. Results of projects are measured only in statistics, not in the experience of real people.

'Going to the Big Boys'

With the Bank's project designs opting to ignore the social roots of poverty, is it surprising that they seem time and time again to achieve the reverse of the stated goals?

Take the Bank's credit to the government of Bangladesh to fund 3,000 deep tubewells. Each tubewell can irrigate 60 acres, making possible an extra crop of rice in north-western Bangladesh. According to a Bank press release, each well would serve from 25 to 50 in a co-operative irrigation group. But independent researchers, Betsy Hartmann and James Boyce, who lived for nine months in one of the villages covered by the project, found what was no secret to anyone in the village: the tubewell ended up as the property of one man, the richest landlord in the village. The World Bank (in reality the Bangladesh government) paid $12,000 for each well; this landowner paid less than $300 for his, and that mostly in bribes to local officials. And the vaunted irrigation co-operative is but a few signatures he collected on a scrap of paper.

Was the Hartmann and Boyce experience atypical? Apparently not at all. Expressing their dismay to a foreign expert working on the project, they were told:

> I no longer ask who is getting the well. I know what the answer will be and I don't want to hear it. One hundred per cent of these wells are going to the 'big boys'.

The project should not be thought of as simply failing to help the 'target group'. Such a project actually *undercuts* the supposed beneficiaries by enriching their enemies. Thanks to their increased income due to the World Bank tubewells, larger landowners will be better positioned to buy out the small farmers, thus driving them into the growing ranks of the landless. The same foreign expert commented:

> On paper it all sounds quite nice.... When the officials fly in from Washington for a three-day visit to Dacca, they look at these papers. They don't know what is happening out here in the field, and no one is going to tell them.

World Bank officials who find themselves forced to admit the failure of such a project invariably do not question its premises. 'More managers', they say, are what is needed.

Not Neighbours, but Rivals

We ourselves investigated another Bank rural development programme in Bangladesh, a major 'pilot' programme called RD-1 (Rural Development Phase One) The stated goal of the $16 million RD-1 is "to reduce the domination of rural institutions by the more prosperous and politically influential farmers and to make farm credits and

agricultural inputs... available to the small farmers through the co-operative system."

The Bank, you will note, presupposes there could be a co-operative system not dominated by the elite landowners.

People in each village we visited, however, told us that the so-called co-operatives were for the well-off — generally the top 10 per cent, owning six acres or more — who controlled the records and determined who could join and get credit. For the rest, especially the half, owning one acre or less, the payment terms are too stringent and the membership fees too high. Moreover, without land, coming up with collateral is virtually impossible. "Even if I did come up with a scheme to pay back a loan", one landless villager complained, "the co-operative would still not give me credit".

The case in Bangladesh confirms a pattern we have found throughout the world: village co-operatives will inevitably be co-opted by the elite groups as long as land remains grossly unevenly distributed.

Projects dreamed up in a social vacuum must play themselves out in real world of injustice and conflict. As one Food and Agriculture Organisation agronomist with 15 years' experience in Bangladesh told us, "The thing to remember about the villages is that the people are not neighbours but rivals". Similarly, we were repeatedly told that the fundamental social reality is a struggle over land: the well-off scheme to get their smaller neighbours in debt to them in order to foreclose on their land: the poor farmers desperately manoeuvre to hold on to the little land they have.

Thus the rural elite who usurp the tubewell — or the new machines or the extension worker's guidance or whatever the Bank projects supposedly earmark for the small farmer — make sure the poor will not benefit. This is true even if it means vastly under-utilising the new input.

"Don't Rock the Boat"

A recent Bank policy paper on rural development explains how projects should deal with "the existing social system". The paper states: "In many countries, avoiding opposition from powerful and influential sections of the rural community is essential if the Bank's programme is not to be subverted from within".

The Bank's commitment to not rocking the boat is clear when we discover that many of its rural programmes do not even make the pretence of aiding the poor smallholders. In "Assault on World Poverty" the Bank states that it is allocating almost half of its rural credit to small farmers. But this means then that more than half of the Bank's rural credit will still be going to medium and large farmers who, at most, constitute only 20 per cent of all landholders in the underdeveloped countries.

Moreover, closer examination of project appraisals has taught us to be on the alert about even the 'almost half' supposedly going to 'small farmers'. For, whether or not World Bank credit is getting to the rural poor depends, in part, on how the Bank defines 'small'. In Guatemala, a joint FAO/World Bank farm credit programme would allocate one-half of the credit to the top three per cent of the landholders, those owning 112 acres or more. The other half would go to what the Bank calls 'small farmers', those owning less than 112 acres. To an American, 112 acres might sound small. But this cut-off point hardly separates out the rural poor in Guatemala where a full 97 per cent of all farmers have less than 112 acres. With such a guideline, the Bank's project could by-pass totally the real poor majority in Guatemala, farmers with less than even one acre and, of course, the many with no land at all.

Even where the stated purpose is to benefit the truly smallholders, the Bank itself acknowledges that the credit go through national agricultural and development banks, primarily winding up in the hands of largeholders. In the Philippines, for example, the World Bank made two loans to rural banks that were partially government-owned. Smallholders with less than seven acres (who comprise 73 per cent of all farmers in the area) actually received less than one per cent of the credit extended.

The Landless

And, if the Bank is serious about attacking rural poverty, what does it offer the many landless in countries where a few monopolise the land? (Even in the Bank's own conservative estimate, the landless make up 40 to 60 per cent of the population.) To deal with the landless, the Bank unabashedly revives the 'trickle down' theory. We were told, for example, that millions of dollars for an irrigation dam will generate more farm employment, a boon to the landless. But, as Hartmann and Boyce ask, "Is giving aid to the rich, so they can hire more poor at subsistence wages, really the way to best help the poor?".

As an utterly rare exception, the Bank did design a sub-project in Bangladesh to benefit landless villagers directly. The $ 16 million RD-1 project includes a meagre $ 4,000 loan for a single landless co-operative to purchase from the government a pond and three acres of land. (There is much more government land in the village but the well-off have usurped it.) Since the workers' income is still such that they must also work for the village landowners to survive, this programme amounts to a wage subsidy for the rich landowners.

Furthermore, the programme includes only a-third of this single village's landless and does nothing to confront the structures which generate their landlessness. In visiting this project, we could not avoid feeling that it was nothing more than a showcase. In signing the co-op's visitors' book, we noticed signatures of visitors from several European countries and Canada. Were the poor people we met there being underpaid for their unwitting service to the Bank's image?

The Bank goes out of its way not to rock the boat even in cases of outright corruption by elites. In Bangladesh, the price-tag on pumpsets for the Bank's deep tubewell project jumped from $9 to $12 million, simply to meet the demand for super profits by the pumpset importer, Bangladesh's richest citizen.

'A Bank Is A Bank'

While 'feeding the hungry' might warm the heart of World Bank officials, there is no column on their ledger sheets headed 'full stomachs'. Poor people growing food for themselves do not produce much money and foreign exchange. For, only if they sell their production, that is, generate 'marketable surplus', will loans get repaid. That is what the Bank is concerned about.

The World Bank, like any other bank, seeks to minimise risk. The Bank itself notes. "Lending only to those with investment opportunities sufficient to produce a significant marketable surplus is perhaps the best way to reduce the level of default." 'Those with investment opportunities' is a euphemism for the larger landholders. It is hard to be at once a bank and saviour of the poor!

Besides betting on the large holder, the Bank often carries its risk minimisation one step further: farmers are 'encouraged' to produce non-food crops. This will ensure a marketable surplus. Cotton and rubber, after all, cannot possibly be eaten by the producers. Furthermore, as the Bank notes, "De-

linquencies in loan repayments) have also been reduced when repayment has been co-ordinated with the marketing of crops that are centrally processed, for example, tobacco, cotton, cocoa, tea, and coffee." Thus, to minimise its own risks, the World Bank prefers *not* to lend for the basic food crops of the people. Actual agricultural loans overwhelmingly demonstrate this preference.

Livestock is the Bank's most favoured 'cash crop', comprising one-third of all agricultural loans. The portion is even higher in Latin America, where over 70 per cent goes to livestock projects. In 1971, the Bank provided a $4 million loan to Guatemala to cover 52 per cent of the costs of a beef project and promised a $15 million follow-up loan for expansion. The benefiting ranchers were dubbed 'medium-sized'. In fact, the sub-loans went to the country's 300 richest export ranchers.

A Bank-financed livestock project in Kenya is allocating 87 per cent of all credit to a few large corporate and other commercial ranches. Bank economist Uma Lele gives a classic Bank rationalisation for so much money going to so few. "The tax revenues generated from these ranches are expected to help the government provide rural services to other needy areas." (Yet another indication that 'trickle-down' theory has not been buried at the World Bank.)

The Bank also favours sugarcane. Visiting Indonesia, we learned that it is bankrolling (so far, $ 50 million) the rebuilding of the sugar mills built by Dutch colonisers. And, according to the *Wall Street Journal*, sugar mill officials are "forcing the unhappy farmers to grow cane at gunpoint".

Besides focusing on the large landholders and cash crops, yet another way to insure that the marketable surplus does not get eaten is to send out 'supervisors'. But the Bank still frets: "...supervision can never completely eliminate increases in consumption following the receipt of loans, even when credit is provided in kind."

Pushing Money

Bank loan officers target loan quotas for each country. They prod project officers to come up with more and bigger outlets to meet those quotas. Focusing on scaring up outlets for huge sums of money is not exactly conducive to Bank officers reflecting on the social consequences of their projects. "Anyone who stops to raise questions", we were told by one Bank consultant who has worked with every department in the Bank, "is considered an obstructionist — not a good team man".

This 'excess funds syndrome' lends itself to the perpetuation of extreme corruption in government. The *Wall Street Journal* reports that, in Indonesia, it is "authoritatively estimated" that 10 to 15 per cent of the total cost of Bank-financed projects (now running at over $ 500 million a year) is dissipated through "leakage". Moreover, as the largest single lender in most countries, the Bank can undermine the efforts of smaller official and voluntary agencies that put tight conditions on aid to circumvent corrupt and exploitative structures. Since the Bank is ready to lend large sums with no effective strings attached, why would a government bother with such agencies? The Bank, development workers have repeatedly told us, tends to be a 'reckless donor'.

In Tanzania, a major part of the funds in a World Bank urban garden project went to an outside contractor for building a storage unit. It cost four times as much per square foot (we were told by a community worker close to the project) as a comparable structure built by the participants themselves in a similar project nearby. The community worker also told us that the Bank this year has channelled into the project twice the amount of money needed. "The excess" she stressed, "leads to waste and inefficiency."

The Bank is pushing money, yes, but not giving it away. Loans must eventually be repaid — and with foreign exchange, earned, as we have seen, largely by the labour of rural people producing for export. At best the Bank, through its IDA operation, gives loans on concessional terms. Much of these loans, however, merely serve to create the cash flow that makes it possible to make payments on previous regular Bank loans as well as private US and European bank loans.

Moreover, Bank projects invariably require the local government to put up 'counterpart funds' to lubricate the local operations of the projects. Thus scarce financial resources — and human ones, too — are tied up by Bank projects.

Repayment of the mounting debts puts a country under ever-greater pressure to orient every aspect of its economy toward exports. The 'debt trap' pushes countries away from building a basis of self-reliance, the only foundation for a new international economic order.

Financing Exports

The World Bank was chartered at the close of World War II to stimulate and finance capital goods exports from countries such as the United States. The Bank inevitably defines 'development' as things that cost lots of money and need to be imported — buildings, foreign high-salary technicians, the vehicles they need, dams, roads, laboratories, audio-visual equipment, and so forth. In Indonesia, at least 50 per cent of a Bank nutrition project goes to 'bricks and mortar' and fancy equipment for fancy buildings, as one American working for the United Nations in Indonesia told us. Even under the heading of agriculture and rural development, World Bank loans go overwhelmingly to build infrastructure — from roads to dams — that enrich local and foreign contractors and consultants. (Not surprisingly, according to a recent State Department estimate, for every dollar the United States has paid into the Bank, $ 2 have been spent in the US economy — which should lead us to ask who is aiding whom.)

Sophisticate audio-visual equipment and other electronic hardware make up over $1,000,000 of the budget of the 1977 agricultural extension project in Thailand. It sounds more like a Stanford graduate programme in mass media than a rural development project in Asia. Moreover, some of the 'bargains' to be purchased for the project by 'international competitive bidding' include: 420 and calculators at $ 50 each; 30 desk calculators at $ 160 each; 30 16 mm movie projectors at $ 1200 each; twelve 21-inch colour television receivers at $1050 each; and on and on. (Business readers might wish to check into selling to the Bank.)

More Than A Bank

The World Bank is not simply a provider of development loans. Over the past few years it has become a major force shaping the economic policies of various countries. In the Bank's own words:

> IDA's borrowers, in particular, would be unlikely to obtain finance on terms as satisfactory as IDA's from any other source; they are therefore unlikely to disregard the kind of advice they may be given by Bank IDA missions whose periodic surveys of their economies include assessments of the soundness of their economic policies.

The Bank has thus begun establishing permanent missions in underdeveloped countries, often located right within planning ministries. In an increasing number of countries, the Bank puts to-

gether and chairs a consortium of the principal bilateral and multilateral lenders that co-ordinate donor contributions and policies. In many countries, such as Bangladesh, the Bank is quietly placing advisers in key ministries of the government. One trump-card of the Bank is that it determines governments' international credit ratings.

Loans go increasingly to the world's most repressive regimes, those willing to implement fiscal measures dictated by the Bank — measures that penalise workers and peasants. Four countries experiencing military takeovers and martial law since the early 1970s — Argentina, Chile, the Philippines, and Uruguay — will receive a sevenfold increase in World Bank lending by 1979. Loans to all other borrowers will increase only three times.

No Accountability

The Bank is in no sense a democratic, or even broadly representative, institution. It is accountable to no one but itself. And it would be naive to expect that such a powerful institution can or will effectively monitor itself. Bank documents are secret. The Bank is virtually unstudied even by social scientists. There are fewer than a dozen articles and books analysing this powerful institution. No staff member will testify befor any congressional or parliamentary hearings. Only recently has the Bank begun to go through the motions of secret evaluations of all the projects it funds. Those who have seen some reports of the Bank's Operations Evaluations Department tell us that they were greatly 'sanitised' when they were later summarised for a Bank public relations publication.

Evaluations are sometimes commissioned to outside consultants; but how independent are they, given that their next contract might come from the Bank? One such major evaluation we heard of was critical. It has been suppressed and the author was ordered to do a 're-write'. Public reports, we are told, must be upbeat in order to gain support in the congresses and parliaments of donor countries.

While in Bangladesh informed foreign sources told us that, recently a mission had flown in from Washington and pronounced the RD-1 programme we discussed earlier a success — "because it is based on sound principles" — and that it should be expanded. Yet, only the day before a Bangladesh government official had shown us an internal Bank memorandum indicting every aspect of the implementation of the project and concluding that the co-op system operates "excessively in favour of the more wealthy farmers".

Moreover, many local government negotiators of Bank loans often aspire to a position with the Bank in Washington. Are they about to question a Bank project? As we were told in Sri Lanka — a country now taking on massive Bank loans for a dam irrigation project — government elites in the capital are already expectant about "having a whiskey" with all the foreign experts who come with such a project. In all, a fairly closed circuit.

Accountable to no one, the Bank is free to make whatever grandiose claims it wishes about the number of people who benefit from its projects. McNamara, for instance, would have us believe the Bank's agricultural and rural development programme will 'reach' 60 million in the 'poverty target group' by lending during 1975-1979. The Bank, you see, likes to count beneficiaries by totalling up the number of people living in the area where a Bank project is to take place. This is equivalent to arguing that a dam in Paluba, California, benefits the population of California which is 20 million, 4 million of whom live below the poverty line. Soon the total of poor beneficiaries is likely to be more than the total number of poor people in the world.

Some at the Bank might reason that meeting the basic needs of the poor would pacify those working to alter present social structures. But, even if this be the goal, their programmes are ultimately self-defeating. Intervening with funds for profit-generating investments, while opting to keep intact the social structures that generate poverty, only strengthens the grip of elites. The result is that the poor are even further impoverished.

On Class Relations in Indian Agriculture

A Comment

Pranab Bardhan

IN 'Class Relations in Indian Agriculture' (June 3, 10, and 17, 1978), Ashok Rudra provided a characteristically provocative piece of analysis and yet this was clearly one of the most systematic, well-reasoned and empirically-based contributions to the literature on the subject. I find myself in agreement with most of his major conclusions, but on some important points I have serious disagreements. In this note I dwell on the latter in the hope of inducing further discussion.

Let me first start by summarising the major points on which I agree with Rudra:

(a) Classes are best defined by contradictions of interests arising from the way they are related to the means of production and in Indian agriculture the most important contradiction is the one between what Rudra calls the hybrid 'class of big landowners' (including rich peasants) and the 'class of agricultural labourers' (including landed labourers).

(b) The Leftist peasant movements have often blurred this contradiction and by attempting to form an alliance of rich and poor peasants against a phantom feudal class have often betrayed (or at least neglected) the interests of the class of agricultural labourers.

(c) Quite often, in the literature tenancy, usury and attached labour have been rather mechanically equated with feudalism. There is a lot of evidence (see, for example, the results of a survey of 276 randomly chosen villages in East India, as reported in my joint article with Rudra in this journal, Annual Number, February 1978) that, whatever may have been true in the past, these institutions have now been largely adapted to the needs of increasing production and profit by enterprising farmers who may hardly be described as feudal.

d) Lenin's oft-quoted alternative 'American' and 'Prussian' paths are both merged in the growth of the Indian class of big landowners: some of them have risen from the ranks of the peasantry while some others were feudal landlords now converted — 'junker'-style — into capitalist farmers as, with the development of forces of production and pliant government policies, agriculture has become more profitable.

(e) Most of the Left parties habitually deplore the sinister alliance between feudal landed interests and those of international imperialism. Rudra briefly exorcises this particular ghost for present-day India and pointedly notes how the interests of international imperialism may very well be in supporting those of the emerging agrarian capitalists (including rich peasants).

My major disagreements with Rudra are on: (i) the relative importance of capitalist and feudal elements in the class of big landowners and (ii) the significance of middle peasants as a separate class. Let us take up (ii) first.

Rudra departs from the Lenin-Mao schema of class differentiation of the peasantry and, in particular, denies the importance of middle peasants as a class category. His argument is that, in the Indian farm hierarchy, it is difficult to discover a group of peasants *who neither hire in nor hire out* labour to any considerable extent and, if there are a handful of such peasants in any particular case, usually they do not have clear-cut contradictions with members of the other two major agricultural classes. I think both parts of this argument are not, in general, valid in Indian agriculture.

Let me cite some evidence. The best source of data on agricultural labour hiring in India is that of the Farm Management Surveys. Take, for example, the farm management data for Hooghly district in West Bengal in 1970-71 (collected under the guidance of Rudra himself). Thirty-eight out of 149 farms (about 25 per cent) in the sample hire less than 9.6 labour days[1] per acre in the year (while the sample mean is about 55 days per acre) and the proportion of hired labour in their total labour use is less than 3 per cent. In terms of absolute volume of labour hiring, 50 out of 149 farms (about one-third hire less than 30 labour days in year.[2,3] One may argue that, any hiring of labour involves exploitation and as such all hirers of labour should be subsumed under the capitalist class. This, I think, is too mechanical a view of class relations. There are many exigencies (eg, family emergency, distant location of land fragments, sharp peaks in short-run seasonal labour requirements demographic imbalance in the household, the need for hiring bullocks which often come with ploughmen, etc) when some middle peasants may hire a small amount of labour without their being involved in the system of surplus extraction through wage labour in any significant sense.

Take another district, Muzaffarnagar in Western Uttar Pradesh. The farm management data for this district for 1968-69 indicate that 41 out of 150 farms (about 27 per cent) in the sample hire less than 11.2 labour days[4] per hectare in the year. In terms of absolute volume of labour hiring, 32 out of 150 farms (about 21 per cent) hire less than 30 labour days in the year.

In the Table we have cross-classified percentages of farms in terms of relative farm size and hired proportion of farm labour for five districts scattered in different parts of the country for a recent year for which we had access to householdwise farm management data. It is clear from the Table that in Ferozepur (Punjab), Muzaffarnagar (West UP) and Hooghly (West Bengal) quite a large fraction of the farms depend on hired hands for less than a quarter of their total labour use (i e, more than three quarters of labour on farm is supplied by family workers). On the other hand, in Tanjore and Coimbatore (both in Tamil Nadu) a very small fraction of farms depend mostly on family labour. The numerical strength of middle peasants (not participating significantly in the labour market) obviously varies from one part of the country to another and there is no question that Chayanov's judgment that such farms constituted over 90 per cent of farms in Russian agriculture in the beginning of the century does not apply to India today; but it will be improper to deny their importance altogether.[5] A more extensive investigation of this phenomenon for different parts of the country is obviously called for.

If the middle peasant category is not empty, the next question is to explore the nature of contradiction of their interests with those of the other two classes. Since they do not participate significantly in the labour market, they do not obviously play a prominent role in the wage-exploitation nexus between the class of big landowners and the class of agricultural labourers. But to the extent the class of big landowners appropriate the lion's share in the government distribution of subsidised credit, water, fertilisers and other inputs, their interests directly clash with those of the middle peasants.[6] The conflict in economic interests of the

SUMMARY ASSESSMENT SCHEME

gives you

AN EASY AND QUICK

income tax assessment

- **No notices requiring your presence in the Income-tax office !**
- **No summons for producing your account books before your Income-tax Office ! !**
- **No additions to the income declared by you in your return, except those necessary to rectify any arithmetical mistake or to make obvious statutory adjustments ! ! !**

SURELY, YOU WOULD LIKE YOUR ASSESSMENTS MADE THIS WAY.

ALL THAT YOU NEED DO IS

- **FILE** your return in the correct prescribed form as applicable to you
- **FURNISH** correct and complete particulars of your income and other details in the various parts and annexures of the return
- **ENCLOSE** with your Return relevant statements of accounts, such as Trading/Manufacturing A/C., Profit & Loss A/C., Balance-sheet, etc if any
- **ATTACH** to your Return **CERTIFICATES** of tax deducted at source, **COUNTERFOILS** of chalans of advance-tax and self-assessment tax payments, **RECEIPTS** for payment of compulsory deposit, life-insurance premia, etc

a correct and complete return is the best security against tax worries

Notes: This table is derived from estimates made, on the basis of Farm Management Survey data, by Kalpana Bardhan in 'Rural Employment and Wages with Agricultural Growth in India: Some Intertemporal and Cross-Sectional Analysis', March 1977 (unpublished). Relative farm size groups are defined with reference to the specific size distribution of the sample for a district in a year. The "medium" size group contains those lying between mean and mean minus 75 per cent of standard deviation. Those below this limit are grouped as 'small'. Those between mean and mean plus 75 per cent of standard deviation are 'large'; and those above this limit are 'very large'.
All cell figures indicate percentage of sample total of farms.

middle peasants and the class of agricultural labourers is less open[7] primarily because socialisation of land or co-operative farming is not an active issue in Indian agrarian politics now. If the landless were organised on the issue of socialisation of land, middle (and, of course, rich) peasants will clearly be in vehement opposition to them. It is no accident that, in spite of occasions of ritual lip-service paid to it, the major Leftist peasant organisations in the country effectively side-track this issue.

Let me now come to the question of the relative importance of feudal and capitalist elements in the class of big landowners, my other major point of disagreement with Rudra. Rudra claims that in his hybrid class of big landowners the feudal elements "do not have any contradictions" with the capitalist elements and, more important, it cannot be said that the emerging capitalist relations are "at the expense of feudal relations".

If the feudal elements in the ruling class in agriculture were strong, I see no difficulty in visualising important contradictions between their interests and those of the emerging capitalists. For example, if a significant part of the labour force were tied in serf-like relations with their feudal masters, the capitalist farmers would face more difficulties in hiring wage labour particularly in periods of peak operations. If a large part of investible funds were locked in unproductive investments or usury, to that extent capitalist development would be hampered by inadequacy of credit or capital mobilisation. If a large part of land were left unutilised (and used only as status value for the landed aristocracy) or undeveloped or leased out only for rack-renting, capital accumulation in agriculture would have surely suffered.

There is no doubt that, in rural India, there is a considerable amount of unproductive investment. For that matter, even in advanced capitalist countries investment in real estate, various speculative activities, etc are quite rampant. The important thing is that a definite trend towards more productive investments and profit-making enterprises in agriculture seems to be setting in, of course, more rapidly in some areas than in others.

All evidence also seems to point to an increase in the use of hired labour in agriculture. On the basis of farm management data, for all the five districts in India which have been resurveyed[8] the hired proportion of total farm labour days went up from 32 to 55 per cent in Ferozepur (Punjab) between 1956-57 and 1969-70, from 28 to 36 per cent in Muzaffarnagar (West UP) between 1956-57 and 1968-69, from 44 to 50 per cent in Hooghly (West Bengal) between 1956-57 and 1970-71, from 25 to 82 per cent in Coimbatore (Tamil Nadu) between 1956-57 and 1971-72, and from 30 to 32 per cent in Ahmadnagar (Maharashtra) between 1956-57 and 1967-68. For India as a whole the recent Rural Labour Enquiry Reports indicate that between 1964-65 and 1974-75 agricultural labour households as a proportion of total rural households went up from 21.8 per cent to 25.3 per cent.

To the extent the rise in the number of agricultural labour households is due to eviction of erstwhile tenants and occupational shifts by artisans and other non-agricultural rural labourers, this may just be a change in the *composition* of the rural proletariat (or semi-proletariat), rather than increased proletarianisation as such. But to the extent some of the erstwhile middle peasants and family farmers have been forced by economic circumstances (rise in the cost and credit-intensity of cultivation, in particular) to join the ranks of agricultural labourers, there has indeed been increased proletarianisation. Evidence of the relative importance of the latter is somewhat fragmentary. The recent Rural Labour Enquiry Report indicates that, in the rise in the number of agricultural labour households between 1964-65 and 1974-75, the largest increase has been in the agricultural labour households *with land*. According to NSS Land Holdings Survey data, in 1970-71 in Punjab (including Haryana), even though only 9

per cent of the rural households did not *own* any land, as many as 54 per cent did not *operate* any land. The corresponding percentages in 1960-61 were 12 and 39, respectively. An analysis of the farm management data for Ferozepur suggests that, while in 1956-57 62 per cent of farms were predominately family farms (i e, depending on family labour for more than three-quarters of their annual labour use), in 1969-70 only 27 per cent were predominantly family farms (it is also to be noted that the majority of the family farms in 1956-57 belonged not to small semi-proletarianised peasants but to the medium size-group of farms).

As labour power increasingly takes on the characteristics of a commodity, as extra-economic coercion in labour relations declines, as surplus extracted from wage labour gets increasingly invested in productive investment, it is hard to agree with Rudra that the emerging capitalist or semi-capitalist relations are not replacing feudal relations. No doubt the transitional process is slower in some areas than in others, but considering that a similar process took two to three centuries in the classic instance of Western Europe, the pace in India has been quite remarkable.

Notes

1 The figure of 9.6 labour days was reached arbitrarily as the sample mean *minus* 75 per cent of standard deviation.

2 In the Hooghly sample there are some farms who are marginal cultivators and some whose primary occupation is trade, service or business. Even if one excludes these households as a possible distortionary influence, I find that 27 out of 115 farms (about 24 per cent) hire less than 30 labour days in the year. One may also like to exclude small tenants who, for all practical purposes, are semi-proletarianised workers and may rightfully belong to Rudra's class of agricultural labourers. If one thus also excludes primarily tenant farms (with more than 50 per cent of the cultivated area leased in) below 2.51 acres in size, I find that 21 per cent of the remaining farms hire less than 30 labour days in the year.

3 For those who are interested in knowing the position about *net* hiring of labour (hiring *in* minus hiring *out*), out of 149 sample households 24 (about one-sixth households in Hooghly 1970-71 hire between *plus* 29 to *minus* 25 labour days in the year. Rudra is, in principle, opposed to the idea of netting relations of exploitation. This, in my judgment, is probably too purist an approach. In any case, for my present argument netting is not necessary.

4 Again, the figure of 11.2 labour days was reached arbitrarily as the sample mean *minus* 75 per cent of standard deviation.

5 Table 1 also indicates that another group which falls outside Rudra's class categorisation, those small land-holders who mostly depend on hired labour, is numerically unimportant in all the five districts considered.

6 In the Hooghly sample referred to above, out of 50 farms that hire less than 30 labour days in the year, not a single one is a net seller of paddy (the main crop) in the market, while 18 purchase paddy. To the extent middle peasants are net buyers of grains, their interests conflict with those of rich farmers who pressurise the government to raise support prices of grains.

7 It is, of course, arguable that in view of the considerable social distance that often exists between the middle peasants and the landless, the cleavage in terms of class consciousness may be wider here than between middle and rich peasants.

8 On account of a change in sample stratification the two period data in the Farm Management Surveys have some problems of comparability.

Even her mother forgets how she has changed

Those who are nearest are often the last to notice the change—because they see her every day. But she minds it when they do not treat her as a different person. So sometimes she has to tell them how she has changed.

To most housewives in India, Hindustan Lever is the supplier of well-known products—Sunlight, Dalda, Lux, Lifebuoy and a host of others. But this company has grown and changed especially in the last five years—so much, that we thought we should tell you something about it.

Do you know that about 60% of our total investments in fixed assets today are in projects in the core sector or sophisticated technology? That we have an investment of nearly Rs. 3 crores and a recurring expenditure of about Rs. 1.5 crores per annum in the largest private sector R & D Centre in India? That over 30% of all our managers are scientists and technologists?

A company goes the way its capital is invested and its management chooses the direction. Our direction is clear: technology-intensive sectors of national priority.

Next time you see her, please remember she has grown and is changing.

THE more vitally connected a particular subject to the well-[illegible] people, the more cavalier, it seems, is the government's manner of [illegible] gets in relation to it. An outstanding example is, of course, the [illegible] liquidating unemployment in the country within ten years. Another is that of achieving universal literacy, again within a period of ten years. The latest annual report of the Ministry of Education, accordingly, claims that "the programme of universalising elementary education constitutes one of the two topmost priority programmes in the field of education, the other being the national adult education programme".

The Draft Five-Year Plan, 1978-83, has set the target of enrolling 90 per cent of the children in the age-group of 6 to 14 years in classes I to VIII by 1982-83. According to the Plan, this calls for an additional enrolment of 320 lakh children during the five-year period. However, even before the Plan has been given final shape, these calculations appear to have been upturned. The Ministry of Education's recent "Review of the Present Position on the Implementation of the Programme of Universal Elementary Education" now estimates that to achieve the target set for 1982-83, the additional enrolment during the Plan period will have to be not 320 lakhs but actually 407 lakhs. Accordingly, one finds, the Ministry of Education has, in its annual report, quietly lowered the target of enrolment for 1982-83 from 90 per cent to 86 per cent.

This is not, however, the most significant aspect of the matter. The question is what likelihood is there that school enrolment will be expanded by 407 lakhs or even by 320 lakhs by 1982-83? According to figures mentioned in the Draft Plan, total enrolment in classes I to VIII was 794 lakhs in 1973-74, 641 lakhs in classes I to V and 153 lakhs in classes VI to VIII. Four years later, in 1977-78, total enrolment had gone up by just about 85 lakhs, 60 lakhs in classes I to V and 25 lakhs in classes VI to VIII. What is even more striking is that enrolment as a proportion of the total number of children in the *age-group 6 to 14 years had not gone up at all during this period*, but had remained stationary at 67 per cent. Enrolment in classes I to V as a proportion of the number of children in the 6 to 11 age-group had in fact declined from 84 per cent to 83 per cent and that in classes VI to VIII as a proportion of children in the age-group 11 to 14 had gone up very slightly from 36 to 38 per cent. One has only to contrast these 'achievements' of the recent past to judge how utterly unrealistic are the targets set under the current Plan.

What is even more shocking is the government's attempt to fob off "universalisation of elementary education" as essentially a matter of pushing up enrolment figures, sweeping under the carpet the well established fact that very large numbers of those who are shown as having enrolled themselves in schools do not complete the relevant period of schooling or even acquire basic literacy. This has been admitted once again recently by the Education Ministry's own Working Group on Universalisation of Elementary Education which says quite explicitly in its interim report: "Existing data on enrolments suffer from over-reporting; a certain proportion of the total enrolment is bogus in the sense that it includes children whose names are shown as enrolled but who, in fact, do not attend schools so that the daily average attendance is often too small in relation to the overall enrolment." Over-reporting of enrolment, according to the Working Group, is large, varying from 8 per cent to 47 per cent, and it is particularly conspicuous in those states which are relatively backward in elementary education. What is even more damning is the Working Group's assessment of the overall situation with regard to drop-outs from schools. It says: "The high proportion of drop-outs has remained almost unchanged during the post-independence period and the problem has become quite intractable." How deceptive the government's enrolment figures are can be seen from the fact that enrolment of children in the age group 6-14 was already 32.4 per cent as far back as in 1950-51 and this figure had touched 60 per cent by 1969-70; on the other hand, according to the Census, the proportion of literates in the age-group 5-14 in 1971 was no more than 34.9 per cent.

And yet the government continues with its dishonest exercise of depicting so-called "universalisation of elementary education" as being a matter of school enrolment. Though the latest annual report of the Education Ministry refers to the report of the Working Group mentioned above, it does not refer

at all to what the Group has to say on the question of drop-outs and the discrepancy between enrolment figures and the actual attendance in schools. Equally significant are the Ministry's proposals to cope with the problem of drop-outs. These consist of, to quote from the Ministr'y annual report. "upgraded school system at the primary stage, policy of 'no detention' till class VIII . . . introduction of play-way methods in classes I-II with adoption of dynamic teaching, teacher improvement and, above all, reform of primary curriculum . . .".

There is no recognition at all that the problem of low enrolment and high drop-outs has most of all to do with the poverty and the occupational pattern of the people. If at all the government considers any section of people as requiring special attention, it is only the scheduled castes and scheduled tribes who, according to the Ministry, "constitute the hard core of the non-enrolled children". While there can be no doubt that scheduled castes and tribes constitute a specially deprived section of the population in regard to education, as in every other respect, the figures of non-enrolment and drop-outs are so large that they cannot be adequately accounted for by reference only to scheduled castes and tribes, who after all together constitute only 22 per cent of the country's total population. It is the poor, including even the relatively poor, especially in the rural areas, who constitute, to borrow the Ministry's phrase, the "hard core" of the problem. It is sheer deception to pretend that technical 'educational' solutions, of the type listed in the Education Ministry's report, are the answer to the problem of low enrolment and high drop-outs among the children of, for instance, agricultural labour families whose numbers have been rising so rapidly both in absolute terms and as a proportion of the total rural population.

Perhaps the most useful purpose served by exercises like those of the Working Group referred to above is that occasionally some of their findings — such as that the proportion of drop-outs from elementary schools has remained almost unchanged during the entire period of so-called planned development and that after 30 years "the problem has become quite intractable" — confirm the findings of other enquiries like those of the Rural Labour Enquiry, 1973-74, that the poverty of the poor has been deepening and that the problem of bringing about any improvement in their economic conditions is equally "intractable".

Aligarh

Paying the Price

WHETHER the incidents at Dadri railway station on May 9 were just a routine case of student hooliganism on the Indian railways, in this case only distinguished by the fact that some of those involved were students of Aligarh Muslim University, and whether the violent incidents including firing, stabbing and arson that duly followed two days later in Aligarh were part of a spontaneous response of students to provocation, will probably be never known with absolute certainty. There are always two seemingly equally authentic versions of any communal clashes in India. Apparently the AMU students were proceeding to Delhi to take part in a protest against the passage of the Aligarh Muslim University Amendment Bill in its present form which, they felt, did not go sufficiently far in restoring the minority character of the AMU. The amendment bill was passed on May 3, despite the almost universal Muslim demand that the quite disingenous and patently unhistorical formulation that the AMU, since it was set up by the Central government by virtue of the AMU Act of 1920, cannot be considered to be set up by the Muslim community of India, be rejected and that the proposed amendment specifically and formally acknowledge the fact that AMU was indeed set up by the Muslim community of India. The amended Act only acknowledges that the 'University' in question means the educational institution which originated as the Muhammadan Anglo-Oriental College, Aligarh, estabished by the Muslims of India, and which was incorporated into the University by this Act of 1920 In other words, the amendment, even while it ostensibly seeks to undo the wrongs done to the AMU by the former government, still places the institution outside the purview of the constitutional guarantees available to all minorities, whether based on religion or language, to have the right to establish and administer educational institutions of their choice.

There are however some aspects to the present outbreak of violence in Aligarh which distinguish it from similar outbreaks elsewhere in the country and even in Aligarh itself last year. In th present instance, the curfew has be most strictly and for longer periods e forced in the civil lines area (whe the AMU is situated) while the tow itself has been relatively calm — a com plete reversal of the situation last ye when the AMU offered sanctuary to t affected victims even when the city w burning. The deaths too have been and around the university campus two AMU students one of whom di in the firing and another by being stal bed, and three university employe rom nearby villages — while life in t city continued to be normal.

Clearly, the present outbreak violence has to be related to the di satisfaction in the University comm nity about the decision of the Cent to wriggle out of its commitment undo the mischief done to the Unive sity by the previous regime. The issu put simply, boils down to this. Th former regime sought to do away wi the historic character of AMU plain with a view to be able to interfere every aspect of the University's lif More importantly, given the inescapab fact that the University continues t reflect and shape Muslim opinion, go ernment expected to control an generally keep track of Muslim loya ties, plainly with a view to using the for partisan advantages.

That can be the only reason wh the AMU has consistently attracte the closest surveillance of successiv administrations at the Centre Th Janata government is as reluctant a the previous regime to unequivocall and in fact and law restore the histo ric 'minority character' of the instit tion instead of maintaining that th 'minority character' was possesse only by the mother institution, th Mohammadan Anglo-Oriental Colleg and that though the present AMU ha to be acknowledged as the legitimat successor of the MAO college, th technical fact of its being establishe by an Act of the Central governmer makes it impossible for the historic fact of its being an institution est blished by the Muslims of India to b formally and legally incorporated int the new Act. Plainly the Janata gov ernment too wants to continue th same dishonest policy towards th AMU, and by extension, towards th Muslims, as the previous regime shows how deeply entrenched are th auspicious cherished by the goverr ment towards Aligarh Muslim Unive sity and its inescapable historic pa — its having been the fountainhe

of Muslim separatism and the nurturing ground to a very large section of the Muslim elite many of whom contributed in theory and practice to the idea and reality of Pakistan — which it wants to erase.

Neither the Janata nor the Congress is equipped to dispassionately understand the historical reasons for the emergence of Pakistan. Nothing illustrates this common understanding of Indian history shared by politicians of the Janata and the Congress than the view that it was the Muslim League and Muslim communalism that was responsible for the creation of Pakistan — which is as neat a way as any of separating the sheep and the goats in India's struggle for freedom. Not surprisingly, the chief minister of UP, who has vowed to have no truck with the RSS and communal forces, has also been a most outspoken exponent of this startling view of recent Indian history. Aligarh, apparently, has to continue to pay the price for nurturing a Muslim bourgeoisie.

Banks

In Unflattering Light

THE nationalisation of the 14 major banks was undertaken a decade ago with many objectives in view. It is time *that a detailed review of the performance* of the banking system was undertaken by the government and the Reserve Bank. This is all the more necessary because studies based on published data have given rise to serious misgivings regarding the performance of commercial banks since nationalisation.

The National Council of Applied Economic Research has just published the results of a study undertaken at the instance of the planning Commission on "Operation of Credit Policies of Nationalised Banks since 1969". The study covered "a sample of 80 branches, chosen purposively". The primary data was assembled through field visits to the sample branches and discussions with branch officials and with selected borrowers. As the sample size was small and purposively chosen, there was no question of blowing up the results for the system as a whole. Even so, the results of the field survey are revealing.

The main features of credit planning at the bank and branch levels, according to the study, were: (1) greater concern for fixing and fulfilling targets of deposit mobilisation, "on which the branch manager's performance was generally evaluated"; and (2) target fixation on an ad hoc basis rather than on the basis of scientific assessment of the potential for development of a particular area or its needs. The Lead Bank and the Village Adoption Schemes, which were intended to conduct a resource audit of each area with a view to identifying worthwhile development schemes that could be financed by banking institutions, "do not seem to have had the desired impact". Often the villages declared to have been adopted by the banks were merely those where the branches had extended a large number of loans.

The study's finding on the rising trend of agricultural loans, is interesting: "While the number of accounts, credit limits and levels of outstanding credit have increased between December 1972 and June 1975, the entire rise in outstanding credit was not due to fresh advances. Part of this was mere escalation of arrears of old advances with accumulation of interest and penal levies". Of overdues in agricultural credit, about one-third *in* short-term loans and two-thirds in medium-term loans were more than three years old. "With rates of interest in this sector ranging from 12 per cent to 15 per cent and a penal rate of 2 per cent, the escalat on in dues *in* case of *non-repayment* can be gauged." The study quotes in this connection a typical example of a dairy loan of Rs 3,500 granted in March 1973 at 15 per cent interest repayable in 10 months. Between March 1973 and December 1975, the borrower had repaid Rs 800, but the credit outstanding against the account in December 1975 was Rs 3651.30! Such cases were not confined to agricultural credit alone: they were found among other priority sector advances also.

The report's finding regarding the regressive nature of interest burden on loans of different sizes and in different sectors is relevant in this context. "The incidence of interest on some of the borrowers in the priority sector was as large as on those in the so-called non-priority sector. If the incidence of interest in different loan sizes is considered, the priority-sector appeared to have *fared* worse in a few catagories .. In sectors like agriculture, there is also the incidence of stamp duties, registration charges and documentation, which work out in many cases to roughly 2 per cent to 3 per cent of the amount of borrowing."

The final finding of importance relates to appraisal and follow-up measures, particularly in regard to bank credit extended to the large industry. The Tandon Study Group's recommendations were communicated to the banks for implementation in August 1975. However, "even as late as November 1976 several banks were still in the initial stage of data gathering from the concerned borrowers for implementing these recommendations". There was also a feeling among bank managers that larger accounts "have to be handled with what they termed as 'velvet gloves' and too much pressure on them for supply of data may result in the loss of such accounts, reflecting poorly on the branch managers". Though the Dehejia Committee had long ago criticised the tendency among the large borrowers to divert short-term bank borrowings for acquiring long-term assets, according to the study, this tendency "appears to be still prevalent". The study has presented concrete evidence in this respect.

On inventory norms, to which the Tandon Study Group gave considerable importance, the study finds that "inventory holding appears excessive in several cases relative to the norms prescribed". The inventory norms prescribed are neither restrictive nor are they firmly adhered to. And yet "the fact that some of the units fall within the norms prescribed would suggest that it should not be difficult to adhere to the norms without hampering production seriously".

Finally, the study has a few pertinent things to say on the inadequacy of the follow-up measures adopted by bank branches to ensure that bank credit is used for the purpose for which it is intended. "Most branch managers felt that these are inadequate, but the apprehension of losing important clients appears to have often led to d luted follow-up measures". Two major follow-up measures in this respect are regular, generally monthly, submission of stock statements and physical verification of stocks. "Several managers observed that in practice stock statements are not received regularly in many cases". Also, in regard to valuation of stocks, "while some branches were checking these values independently, many merely accepted the values submitted by their clients". Several bank managers confessed that "though physical verification was to be undertaken once a month, this was rarely followed in practice ... There

were cases where branches had more than 100 godowns under their control, but without a godown inspector to undertake physical verification".

In sum, every aspect of the apparent achievements of commercial banks appears to be questionable. The institutional arrangements such as the Lead Bank Scheme and the Village Adoption Schemes, intended to bring about major changes in the regional and sectoral distribution of bank credit, have not got off the ground. The increase in bank credit to priority sectors is partly statistical. The interest burden continues to be regressive and inequitous. The larger borrowers continue to divert short-term funds for creation of long-term assets and excessive inventories remain unchecked. Finally, the end use of bank credit by the large parties is not checked by obtaining regular stock statements, by scrutinising the valuation of stocks or by physical verification of stocks.

Politics

Lose One, Lose All

EVEN the most enthusiastic supporters of Indira Gandhi cannot maintain that the Congress (I) rally at Delhi on Wednesday was exactly the huge affair that its organisers had expected it to be. Leaving aside the question of the number of people who actually attended the rally, the estimates of which made by the Press, the police and the Congress (I) naturally differ, what should have been of greater concern to Indira Gandhi was the relatively poor representation of the Congress (I) leadership at the rally, particularly the absence of the chief ministers of the only two states where the Congress (I) is in power.

The disciplining of the Karnataka Chief Minister which was to be one of the main tasks of the post-rally session of the Congress (I) Working Committee too does not seem to have made any headway. During her recent visit to Karnataka, Indira Gandhi had announced that the general practice of not having the same person hold the office of both the head of the government and the head of the party would also be applied to Karnataka. Since the Karnataka PCC was yet an 'ad hoc' body and since Devaraj Urs had occupied the office of the president of the state unit by virtue of his election to the position in 1972 when the party was united, his replacement would be by way of a nomination and not by any election. But Devraj Urs himself left no doubt during the KPCC (I) meeting attended by Indira Gandhi that his replacement would have to follow a decision, by the executive committee of the KPCC on the venue and date of a meeting of the general body which in turn would elect the new president. Indira Gandhi was thus faced with the choice of either appointing, in her capacity of the president of the Congress (I), a new ad hoc KPCC (I) without Devaraj Urs as the president, or waiting for the procedural formalities of the election of new president to be gone through with the almost certain prospect of Devaraj Urs once again being elected as the president of the state Congress (I). Wanting to avoid the latter possibility but unwilling to exercise her authority directly, she expected the CWC (I) to take the decision to replace Devaraj Urs. But the CWC (I) meeting that followed the rally, and which Devaraj Urs did not even attend (the scarcely credible excuse being the same as was offered for his absence from the rally as also for the poor representation of the state MLAs — that they were all busy with the assembly session) has had to put off the question of finding a successor to Devaraj Urs as the party chief in Karnataka, as also the method by which that successor should be chosen.

With such friends as Devaraj Urs, Indira Gandhi must be wishing that she certainly needs no enemies; but of these too, there has been no dearth, and they too are thriving. The confusion and dissension that she tried to sow amongst them has not borne any fruit. The Congress which she thought would be so demoralised at her exit that it would come running to her has shown surprising resilience, and has neither been broken or bought. Moreover, Thursday's elections to the Congress Parliamentary Party clearly marked a setback to Indira Gandhi's Trojan horses in the party. In the Janata, the consolidation of the Jana Sangh elements who have continued to solidly support the Prime Minister has meant that a possible alliance with sections of the Janata opposed to the Jana Sangh is now more on the

cards. It should be particularly mortifying to her to see that she has even ceased to be part of Janata calculations; the Janata party has no doubt many grave problems, but Indira Gandhi is no more one of them. The gravest setback must be the obviously forced decision to seek election to Lok Sabha from Tamil Nadu from a constituency and against a possible opponent where the chances of success are distinctly less than they were in her previous effort from Karnataka.

The decline and fall of Indira Gandhi shows how flimsy her vaunted 'mass base' was; and how relentless and irreversible the loss of 'popular' support has been after the loss of her official position. In the kind of politics that she practised, as in the kind of economic structure that the various ruling factions are trying to build, it is not merely that the winner takes all; equally, it is lose one, lose all.

LETTER TO EDITOR

Citizens' Initiative Movement

MY article "The Citizens' Initiative Movement in West Germany" (April 14) was not only a report on the movement, but it also tried to highlight the movement's special political significance, which was mostly edited away by you. In the following lines I would try to draw the readers' attention to this special significance.

(1) For the first time after the Second World War, capitalism is being questioned again in West Germany (in other developed industrialised countries also) by a section of the population (previously only a small insignificant number of communists have been doing it). This questioning is based not on the classical Marxist argument that capitalism fetters the forces of production and hence it should be overthrown and replaced by new relations of production more conducive to the development of the latter. On the contrary, it is based on the argument that capitalism has already developed the forces of production so much that any further development of the latter, which capitalism is very much capable of and will do — unless prevented — because of its inner dynamics (even if it is at a retarded rate), will destroy nature and the social environment.

Not that all participants are aware that the movement is questioning and opposing the very capitalist system. Most of them think that they are just advocating a "rational" economic system, protection of environment, etc. But their movement is *in fact* opposing capitalist accumulation. They are not only protesting against and preventing the construction of atomic power plants, they are opposing further industrialisation itself. For example, in Bergkamen, West Germany, the CIs opposed the construction of even a coal-based thermal power plant (argument: we have enough energy, no more pollution); in Markolsheim, France, the CIs opposed the construction of a lead-chemical factory (argument: health); in Norway the CIs prevented the utilisation of a waterfall for production of hydel power; in Kaiserstuhl, West Germany, they opposed the APP not only because of the radiation hazards, but also because they were afraid of the plan to create a second Ruhr area around the APP.

(2) With this approach to a critique of capitalism not only is capitalism being questioned, but also the very belief that progress and development, even today, are based mainly on the development of the forces of production. With this is being questioned a fundamental element of classical socialist thought, *viz*, that communist distribution would be achieved through an enormous development of production, which would create *abundance* of material goods and services making possible distribution according to the principle "... to each according to his need".

The CI movement is opposing the quantitative approach to progress and development. The main question, according to them, is not "how much is being produced", but "*what* is being produced". The main point is not quantity of consumption, but quality of life.

(3) The CI movement is also questioning the present-day parliamentary democratic system, but again not from the classical communist standpoint. They are not for the replacement of parliamentary democracy by dictatorship of the proletariat, which, according to them, is just another name for the dictatorship of the communist party bosses. They want to replace parliamentary democracy by what they call "basis democracy" or "participatory democracy": democracy at every level, in every sphere of life, beginning right on the shop-floor. This political system would work from below upwards and not from above downwards as is the case in both capitalist democracies and present-day "dictatorships of the proletariat".

There is a definite correlation between their opposition to further industrialisation and their advocacy of basic democracy. Basis democracy cannot thrive in a centralised system, it needs more and more decentralisation. But further industrial growth on present lines would inexorably lead to further centralisation.

This correlation is much greater in the case of their opposition to atomic power plants. In an "Atom State", where the whole economy is based on power supply from a chain of APPs, freedom would vanish. The APPs are vulnerable to sabotage and the consequences of an act of sabotage might be catastrophic. In an "Atom State", in order to guard against any possibility of such sabotage, the state would have to watch and control almost every act of every citizen. 1984 would then become a necessity.

(4) This kind of questioning of capitalism and parliamentary democracy is being done not by the organised working class, which is "organised" in hierarchical, authoritarian trade unions working on similar lines as a capitalist enterprise, but by small peasants, students, teachers, doctors, scientists, small shop-keepers, etc. In fact, the great majority of the organised workers are, on this question, on the side of the capitalists and the ruling politicians. But the spirit of the CI movement is spreading among them, albeit slowly.

The Citizens' Initiative Movement has not yet spoken out unambiguously for a socialist society, only leftist participants have done that in their own capacity. It could not be otherwise, given the fact that everybody who supports the particular purpose in view can join a Citizens' Initiative and especially because the CI movement has no central organisation. But they cannot but realise sooner or later that their broader and long-term goals can be achieved only in a socialist society, although such a socialist society would look much different from what is today called a socialist society.

Tactics of Doing Nothing

Romesh Thapar

HAS anyone calculated at this moment of crisis the vast sums of money which we are expending internally, holding seminars, workshops, seed conferences, and what have you. Hundreds of experts are travelling all the time to share thoughts, experiences and research with their colleagues, a delightful scholarly tourism at the expense of university and corporate budgets. We are believed to be among the most sophisticated participants in this kind of activity. And, whatever the cynics might say, the claim is that even in normal times it keeps the continent together and balances regional aberrations.

I am sure it does, but I am questioning the themes which are now under endless discussion. Actually, they have been debated threadbare. There is very little new to say. What is forgotten in the process is that we have become experts in doing nothing. Our dialoguing, if you can call it that, is a precise tactic for this end result. What we need urgently are exercises on the priority areas for action. Then we would realise in a flash what happened to us. Yes, we have built up an apparatus to ensure probity, equality and self-reliance; but all that it has succeeded in doing is to suffocate initiative, create a class of influence peddlars and crack the moral fibre that our society once possessed.

Sacrosanct Notions

Clearly, the investigation of the Indian condition — economic, political and social — cannot even begin to make sense unless we confront so many supposedly sacrosanct notions which make a mockery of everything we do. Take a sampling. Whether it is on the question of non-performance in critical areas of the public sector, or on the rampant corruption in the vast and sprawling empire of the Finance Ministry, or on the absurdity of trying to fix rigid compartments for growing business groups, or on the crazy non-implementable urban ceiling legislation, or on the vast system of harassment built up in the name of socialism, and now threatening to make criminals of all of us, the remedial measures demand the brutal puncturing of many fond beliefs. Interestingly, not a muscle flexes for this effort.

Attend any seminar, conference, workshop, or seed conference, and there is a deluge of cliches, some better phrased than others, a few even parading in the costumery of the academic world — and that inevitably means the statistics which we all know are horribly suspect. Indeed, it is becoming known that the Planning Commission itself is sorely perturbed by many of the equations it has rooted itself in. But the gatherings of experts do not reduce in number as the country grinds to a halt. They increase, if only to repeat the familiar *mantrams*. We are suffocating ourselves — Rightists, Leftists, Centrists, the whole bally lot.

Internal of External Monopolies?

When will someone in the political pyramid develop the courage to say that a really excellent indigenous car will not result from foreign collaborations (now promised by the dozen!), but by giving an opportunity to the finest automobile establishment in the country — TELCO? You cannot separate the intention to produce a quality Indian car from the expertise that exists at a certain point. Yes, it would violate the monopoly *mantram*, but would that not be better than what is planned to get over the blocks we have ourselves created against our interest? In any case, shouldn't there be a debate about such an issue instead of the current inspired lobbying over the Siemens deal?

Then again, when will someone in the Finance Ministry (in the interests of economic efficiency!) decide that the time has come to pull down a vast infrastructure of phoney surveillance and form-filling which only benefits the larger operators who can afford to employ regiments of experts to cope with the demoralising task? Could this exercise be extended to the area of taxation so that the systems can be simplified to the extreme, cutting out the endless harassment? We talk of bureaucratic gambits, but the Finance Ministry has been flourishing for years under the benign guidance of academics — and with plenty of 'phoren' expertise.

At every level of our society, someone is digging his dirty claws into someone. This is our new culture of development, the specialisation in over-and-above earning. If our MPs were given to study, they would realise that fifty years ago some of the most advanced societies of the West were vitiated by such corruption. Only an improvement in wages, and a proper system of reward and punishment, changed the picture. The trouble in India is that moralistic blah blah is used to wish away corrosive corruption — and by politicians who set the worst possible example from the day they start fudging their election expenses. As for reward and punishment, never heard of them.

Crisis Operations

And, again, why not a few intense debates on industrial relations, the disciplines of work, hire and fire, the accountability of management, and participation in decision-making by the men on the work-bench? In other words, when will we take a good solid look at ourselves? Simple discussions with down-to-earth result. Perhaps, we may succeed in seeing ourselves as the world does — a talented, scruffy, unprincipled, cowardly, rude and unorganised bunch of talkers unable to produce, or even to maintain what has been assembled. This only happens these days in flashes, when the power supply fails, followed by the water, and after the telephones have gone to sleep.

This is not an attempt to be melodramatic. It is an imperfect way of saying that the country has entered dangerous days. We are merely talking among ourselves, as brilliantly as ever, but doing nothing. Yes, nothing that gets us moving. This cannot go on for long. Too much reliance is placed on traditional patience. Now, no one in Delhi can even tell us whether we have passed the point of no return. Talk to Prime Minister Desai, and you'd think India was taking off. Maybe, India-watching should be given over to the astrologers in these summer months . . . .

Diversifying with Strength

Hansavivek

DHARAMSI MORARJI CHEMICAL is setting up a plant for manufacture of 850 tonnes per annum of sodium silico fluoride and/or aluminium fluoride and 250 tonnes per annum of silica compounds/activated silica at its Kumhari works. The company already holds an industrial licence for production of these items at its Ambernath works. Meanwhile, the sulfamic acid, ammonium sulfamate and di-ethyle sulphate plants at the Roha unit have stabilised. This unit, however, has yet to start making a profitable contribution to the company's working results. Work on construction of two other plants — *viz,* benzene sulphonyl chloride and thiophenol — is in progress. The company has achieved good success in its research and development efforts. Indian Chemical Manufacturers' Association has conferred on it an award for designing a plant for the manufacture of synthetic cryolite from waste off-gases from phosphoric acid and superphosphate plants and also for the good work done in the field of process design and engineering of DCDA sulphuric acid plants. The company has well maintained during 1978 the tempo of progress and broken earlier records in production, turnover, and profits. It has once again emerged as the largest single producer of single superphosphate in the country. Between Ambernath and Kumhari plants, single superphosphate capacity utilisation exceeded 100 per cent, compared to 97 per cent achieved in the previous year. Against a total production of 10.94 lakh tonnes in the country, the company's contribution was 2.42 lakh tonnes. Its capacity utilisation in the case of sulphuric acid was 91.9 per cent. Performance might have been better still, had the company not been forced to take a premature closure of its sulphuric acid plant at Ambernath for about four weeks in November-December last due to shortage of sulphur. Net sales increased from Rs 21.80 crores to Rs 24.62 crores, and gross profit was up from Rs 4.57 crores to Rs 5.43 crores. Net profit was Rs 1.97 crores (Rs 1.78 crores) and covered unchanged 16 per cent distribution 2.24 times. A portion of the dividend is expected to be exempt from tax. During the first four months of the current year, the company increased its production of all items further and sales turnover amounted to Rs 8.50 crores against Rs 7.36 crores in the corresponding period last year. The new chairman, R M Goculdas, however, does not envisage the picture for 1979 as promising because of uncertain availability of imported raw materials, specially elemental sulphur. Because of the political situation in Iran, a short supply situation in sulphur has gradually arisen and the government authorised MMTC to ration supplies to the user industries since January last. DMC was permitted to arrange a direct import of 25,000 tonnes of sulphur, which has enabled it to maintain the same level of production. Efforts are being made to ensure continued availability of sulphur after present stocks are exhausted. Meanwhile, prices in the international market have hardened. Secondly, the Central government has decided to get a study of this single superphosphate units made by the Fertiliser Industry Co-ordination Committee in the context of the scheme of subsidy on phosphatic fertilisers.

SVADESHI MILLS has fared well during 1978 with the gross profit rising by a half, from Rs 103 lakhs to Rs 153 lakhs, even though sales stayed at the previous year's level of Rs 23.45 crores. Net profit is also substantially better at Rs 62 lakhs (Rs 44 lakhs) and equity distribution mainatined at 20 per cent on the capital as enlarged by issue of bonus shares in the proportion 1:4 is covered 1.90 times as against 1.17 times previously. To raise additional finance, the company has issued further debentures worth Rs 45 lakhs and privately placed them with financial institutions. The 7 per cent (taxable) debentures of the value of Rs one crore are due for redemption in January 1980. The management is considering a proposal for extending

the date of maturity upto 15 years with increase in the rate of interest to 11 per cent per annum with effect from January 1, 1980. The improvement in the company's profit is attributable to reasonable prices of raw materials and multi-fibre policy of the government, which have benefited the cotton textile industry as a whole. The company has been pursuing the process of modernisation. It installed a number of items of machinery during the year. These would enable it to achieve further sophistication in the varieties of cloth.

CADBURY INDIA has been directed by the Central government to restrict its production of 'Bournvita' malted food to 1,260 tonnes per annum against the installed capacity of 5,430 tonnes. The company's actual production during 1978 was 5,110 tonnes, including 1,100 tonnes for exports. If the government's decision were to be strictly implemented, the company would become "economically unviable". According to the chairman, Prem Pandhi, the industrial undertaking was established prior to the date when the Industries (Development and Regulation) Act, 1951, became applicable to it. The higher level of production has been achieved by improvements in processes and techniques and the addition of balancing equipment. The company has sought legal advice from eminent counsellors and has replied to government reiterating its case for fixing of the capacity at the installed level of 5,430 tonnes. At the time of its public issue in June 1977, the company had stated in the prospectus that application had been made to government for endorsement of "current capacities" on the "registration certificate". In March 1978, the government fixed capacities for chocolate products and endorsed these on the registration certificate but for 'Bournvita' the problem has been persisting and the company claims that the government's decision has come as a complete surprise. Pandhi has observed that the company has received full support from the government in the process of its Indianisation and diversification in the last 2/3 years. In the next few weeks, the company will be an Indian company with only 40 per cent non-resident interest.

FROM OUR CORRESPONDENTS

NEW DELHI

Gunning for the Public Sector

B M

THE recommendation for closing or handing over to the private sector 28 public sector undertakings which were dubbed in a study made in the Bureau of Public Enterprises as "perennial losers" has naturally raised many eyebrows. Among the units which figure in the study are such prestigious ones as the Heavy Engineering Corporation and Mining and Allied Machinery Corporation. Interestingly enough, the list also contains Richardson and Cruddas which was taken over by government some years ago because it had become a sick unit in private hands and it was considered of some value to the national economy to restore it to health.

The report, when it leaked out to the press, was naturally embarrassing to the government. The Minister of Industry, George Fernandes, has denied any intention of closing down loss-making units or handing them over to private hands. But it is interesting that when the report was received by the Minister of Finance, Charan Singh, he thought it to be important enough to mark it for the attention of the Prime Minister. The Prime Minister, on his part, saw it and marked it back to the Finance Ministry which holds administrative charges of the Bureau of Public Enterprises. Such high level attention to the report, it seems, encouraged the authors — senior officers of the Bureau — to leak it out to the press. But the responsibility of the Bureau as such for the report is now being hotly denied and it is held to be the work of only two individuals in the Bureau. However, the point has not been missed that the despatch of the report to the Finance Ministry itself was inspired by the strong speeches made both by the Prime Minister and the Finance Minister at the conference of public sector enterprises held some time ago where public sector undertakings and their managers were berated for making losses. The Prime Minister went on to threaten that heads would roll if the undertakings did not make profits and the Finance Minister deprecated diversion of public funds into investment in public sector enterprises instead of in small industry and agriculture.

How far the authors of the report represent a trend of opinion within the political leadership and government must, of course, remain a moot point. It may also be argued that the substantive recommendations in the report go too far and, therefore, have no relevance to any action that the government might take to improve the profitability of the public sector. But the report does underline the attempts, deliberate or innocent, that are being made on a wide and varied front to run down the public sector and sap the morale of the men who manage the public sector undertakings. The exact role and the functioning of the Bureau of Public Enterprises under the Union Finance Ministry has begun to attract considerable attention in this context. This is of some importance in the prevailing climate in which the public sector undertakings are operating. With Charan Singh at the head of the Finance Ministry, the Bureau is increasingly being called upon to provide alibis for more and more interference in the working of the public sector undertakings above the heads of the administrative ministries concerned. This is one side of the picture. The other is that the civil bureaucracy seems to be bent upon regaining its supremacy and close control over the management of the public sector undertakings which had somewhat loosened with the introduction of the rule that a civil bureaucrat had to opt either for a management post in a public sector undertaking or retain his substantive ranking in the secretariat and administrative hierarchy. This rule was made in the early seventies in order to strengthen the autonomy of public sector management and ended the system of deputation of IAS men and other ranks in the administrative services on postings in public sector undertakings with special allowances and other benefits. The administrative services were not happy with all this and have been working hard to restore the earlier position. They find the present environment favourable for their purpose and moves have been initiated and even carried out in some cases to revive the system of postings in public sector

undertakings on deputation. In addition, the administrative set-up with the all-powerful secretary in the administrative ministry concerned at its head has begun systematically to interfere in the day-to-day functioning of public sector undertakings.

Oddly enough, these designs on the part of the Finance Ministry, on the one hand, and the administrative bureaucracy as a whole, on other, have received immense help from some unexpected quarters. The hard hitting reports of the Committee on Public Undertakings of Parliament headed by the intrepid CPI (M) MP, Jyotirmoy Bosu, have naturally received wide publicity. These reports have exposed the extravagant life style of public sector managers and wasteful expenditure by public sector units on wining and dining, maintenance of five-star guest houses and foreign jaunts. The substantiv part of COPU's recommendations, however, has its own logic. In almost all cases, the COPU has demanded that the government, which in effect means the departmental head in the administrative ministry who is the secretary, should strengthen its supervisory functions in relation to the executive heads and boards of management of the public sector undertakings. It has called for fixation by the government of the money that they may spend on entertainment, advertisement and foreign tours and for the laying down of similar other rules about use of transport or guest house facilities and, finally, for reporting on all these matters to the department concerned. In case the Chairman or the Managing Director of a public sector unit wants to go abroad, the clearance of his board would not be good enough. He would have to seek the prior permission of the secretary of the administrative department concerned. There are a whole host of similar recommendations which would mean in effect that public sector undertakings function not as autonomous commercial entities but as departmental undertakings directly controlled by the administrative ministries. However, unlike the existing departmental undertakings like the railways or post and telegraphs they will be run without accountability on the part of the administrative bureaucracy.

In this scheme of things, the Bureau of Public Enterprises seems to be a handy instrument at hand and it is being used with all the ingenuity and fanfare that the concerned interests can command. The Bureau was started with the idea of setting up a small information centre within the Finance Ministry and a data bank for the Ministry to draw upon. But over the years, as happens with such ventures in the government, it has bloated into a big organisation and it has begun to behave as if it were a super controlling body for all public sector undertakings. It is sometimes suggested that the Bureau could be a body of experts providing consultancy services to public sector undertakings. But in fact the Bureau has little expertise nor has anything worthwhile been done to build up the right kind of expertise which will enable it to provide such a service. It is this in any case an unworkable idea for the public sector as a whole. In most cases, the technical and management capability within the undertakings is unquestionably far superior to what the Bureau has and can hope to assemble within its essentially bureaucratic set-up. The result has been that the administrative ministries, in particular the Finance Ministry and the bureaucratic hierarchy in the government generally, have used the the Bureau to set all pervasive norms and standards concerning management practices which may be relevant and may work in the case of government departments but are wholly out of place in the running of public sector undertakings. The extent to which such use of the Bureau has queered the pitch for labour relations in the public sector is shown by the uniform wage norms and standards that have been sought to be imposed on public sector undertakings, and the sharp protests of the trade unions on that account. The same applies to many rules and so-called guidelines which are issued from time to time through the Bureau.

As a public sector manager recently put it, the Bureau has become an extremely unwanted and obstructive fifth wheel in the coach and it is time it is wound up as a first step towards a meaningful effort towards promoting autonomy and efficiency of the public sector industrial and commercial management. One of the tasks assigned to the Bureau is public relations and publicity for the public sector enterprises, but it is in fact messing up publicity for the undertakings. After all, its report about losses incurred by the public sector undertakings has been pounced upon by the detractors of public sector enterprises, both in the government and outside, to run down the public sector. According to some public sector managers, the report itself was a poor accountant's job and would not stand rigorous utiny. It was indeed out of their sense of frustration over the working of the Bureau of Public Enterprises that some public sector managers took the initiative to set up a body of their own called the Standing Conference of Public Sector Undertakings (Scope). But so far Scope does not seem to have got off the ground and made its impact in lessening the deadening bureaucratic weight under which public sector managers have to function.

JAMSHEDPUR

Riots as Cover for Land-Grabbing

A S

THE most disturbing feature of the Jamshedpur riots was the organised gangsterism of the RSS. This was manifest from the mohalla to the greater city area. Though the local sponsors of the Ramnavami procession who were arrested as a precaution prior to April 11 were RSS men, Hindu frenzy had been already whipped up and successfully engineered against Muslims. The master brains are indeed still to be found out.

It is interesting that, even as the steel city was aflame, the Jana Sangh constituent quit the Bihar ministry and forced a trial of strength to throw out the Karpoori Thakur ministry. Since June 1977, the Jana Sangh had expressed unqualified solidarity with the BLD within the Janata ministry. Only a few days before the Jamshedpur riots, Kailashpati Mishra, the leading JS figure and finance minister, had voiced support to Karpoori Thakur — setting at rest doubt about the Thakur ministry's survival. However, four days after the stunning violence began in the steel city, JS calculations of loyalties changed. Karpoori Thakur's announcement of the institution of a judicial enquiry may have precipitated the JS withdrawal from the ministry. Indeed, one of the very first decisions announced by the new ministry was a 'review' of the judicial enquiry.

Assessment of the riots themselves indicates joint involvement of the RSS, the Bihar Military Police (BMP) and the state police forces. Evidence of this could be found also in the leaflets issued by the Hindu fanatics for congregation of the Ramnavami procession at Mango. The leaflet, titled "An Appeal of Religion", exhorted the Hindus to join the procession, adding that the men of the state police forces and the home-guards are "with us".

On April 11 and 12, the first two, and the worst, days of rioting, the BMP and state police forces had a field day. "It looked as if the Bihar Military Police were commanded by some RSS officer", said some Muslims at a refugee camp. Surprisingly, the BMP forces went into action just a few hours after the outbreak of violence, driving into Muslim bustees in a deliberate, pick-and-hit style. The BMP had the largest number of companies (10) among all the forces drafted for Jamshedpur. The Border Security Force had 6, the CRPF 3, and the Army 3.

In the first two days of violence, the forces put to action were mainly the BMP and the state armed police. The Army, the BSF, and the CRPF started intensive operations after that. In the raids on the Muslim bustees, the BMP and RSS men were seen to act in collaboration. The criminality of the BMP can be gauged from the facts given by officials: In the week-long violence, a total of 700 rounds were fired by the various armed and police forces: out of this, the BMP fired 560, or 80 per cent of the total rounds.

The adivasis joining the Hindu hysteria was another striking feature of the Jamshedpur riots. Significantly, the intensity of the violence was very high in the adivasi villages which enclose the township. The Jharkhand colony in Mango, whose Ramnavami procession touched off the internecine bloodshed, *has 85 per cent adivasi population*. The adivasis now living in the rural-urban fringe are the poor and landless peasants who over the years have been pushed out by an expanding township. The majority of contract labourers of the city are adivasis. Their anger would naturally be directed against the urban land grabbers and contractors belonging to both communities. It has to be credited to the Hindu land grabbers and contractors that they were able to use the adivasis against their Muslim rivals. Moreover, such systematic use is not possible without a well organised force.

Mango is comparatively a new settlement in Jamshedpur. Jamshedpur city comprises three concentric circles of settlement. The central district, or the nucleus, is entirely company area — exclusively for upper-class employees and commercial concerns. This area includes Bistupur, the Sakchi boulevard, Monument Road, Director's Bungalow, etc. The second circle is of the new suburbs such as Adityapur the TELCO colony, and Baridih, and also includes the quarters built for their employees by the Tata industries and the government. The greatest circle is the bustee comprising the rural-urban fringe. Needless to say, the flood of people from the hinterland — from several areas such as Sonari, Burma Mines, and JKLMN towns which lay within the central district — was directed here.

Jamshedpur in the past has received a huge number of settlers, both workers and businessmen. They came with the expansion of the various Tata industries, the second world war, the influx of refugees after partition, the emergence of several small and medium industries, and so on. The immigration generally took place into the outlying areas — once the province of adivasis. The population of the city, which was merely 5,000 in 1911, rose to 200,000 in 1951, 300,000 in 1961 and 600,000 in 1971. The present estimate of the population is 800,000.

This has led to a phenomenal pressure on land, especially in the fringe areas. Mango is a fringe area. It registered the highest increase, of 500 per cent in 1951-61 and 1,000 per cent in 1971-79. This was partly due to the shifting of the bustees from the heart of the city and the influx of refugees, small traders, and businessmen. Moreover, Mango is nearer the courts and the government offices. Having suffered for having lived in scattered areas at the time of the 1964 riots, the Muslims of Jamshedpur had also chosen to live here concentrated in big bustees. In this way, the big Muslim bustees, such as Azadnagar and Ulidih, grew at Mango

Land speculation seems to have been highest at Mango. Many Muslims and Hindus were involved in land disputes Mango has only 10 per cent Muslim businessmen. It is interesting that, at Mango, some cases of killings have been of persons involved in land disputes Once the elders of the family are finished, takeover of the land becomes a simple matter of *ex-parte* decree.

In such a communal atmosphere, the trauma that the refugees from Pakistan carry can be employed to violent effect. Even in normal times Mango's sizeable refugee population acts against Muslims with a vengeance: The refugees are mostly in business and so are the majority of Muslims.

A feature of the riots is their concentration in the fringe areas such as Mango. The central district, the elite zone, has remained entirely free and the suburbs have been only superficially affected. After the 1964 riots, 4,000

Muslims fled to Pakistan and a still larger number to the towns considered safe from communal riots. The aftermath this time is going to be more serious. Communal frenzy has thus had the effect of driving out the weaker immigrants from their land as well as from company quarters. The various companies had in any case been under pressure to give housing to their employees. TISCO, for instance, has allotted quarters to only 15,000 of its 34,000 workers. Of the 20,000 workers of TELCO only 8,000 have got company housing.

JANATA PARTY

Jana Sangh Rides Strong

M H J

THE Janata party parliamentary board meeting on May 6 dispersed, after a three-hour sitting, without having taken a formal decision on the demand, vociferously made by Charan Singh and his supporters in the BLD and the Socialist Party, that members belonging to the former Jana Sangh within the Janata party should terminate their connection with the RSS. Significantly, Jagjivan Ram, George Fernandes, and Janata party president, Chandrashekhar took a neutral stand in the discussion. The Prime Minister, Morarji Desai, aligned himself with the Jana Sangh. As in the earlier meetings to discuss the permissibility of holding membership of the RSS by the Jana Sangh members within the Janata party, the Jana Sangh once again emerged as strong as ever.

The External Affairs Minister, Atal Behari Vajpayee — with the open support of Morarji Desai — forcefully pointed out on behalf of the Jana Sangh that, at the time of the 1977 elections, it had been very clear that the RSS members would be able to be members of Parliament and leaders of the Janata party. Now, Vajpayee told the meeting, the Board was of course free to decide whatever it liked given the Jana Sangh's unbreakable relationship with the RSS, but he made it clear thereby that the former Jana Sangh members would not compromise their connection with the RSS which to them 'is sacred'.

The Board decided to reassemble on May 15 to discuss the same issue. Obviously, this will give it time to help arrive at a compromise. One proposal is that Charan Singh should give up his stand that Jana Sangh members should sever their RSS connection, and that as *quid pro quo* the Jana Sangh leadership would accept Charan Singh's nominations from among his BLD and Socialist friends to the various organisational posts in the party both in and outside Parliament. It is also understood that, Raj Narain, former Health Minister, who is making all the anti-RSS noises on Charan Singh's behalf, should be given some post in government. This latter suggestion came from George Fernandes — a one-time socialist friend of Raj Narain.

To Charan Singh it has been sharply brought home that his anti-Jana Sangh-RSS tirade will not pay political dividends. Charan Singh has also realised that the Jana Sangh-Morarji Desai alliance is a firm one. Given the Jana Sangh's inherent strength, moreover, it will not be possible to ease it out from the Janata party. He also clearly sees the futility of breaking the BLD away from the Janata; he has already lost a major political support in Bihar in the defeat of one of his staunchest allies, Karpoori Thakur, as chief minister of that state. His two major supporters in Haryana — chief minister Devi Lal and state party president and MP Chandravati — are facing the charge of breach of party discipline for their alleged anti-party activity in the recent Assembly by-election at which the Janata nominee lost the seat. In his home state of Uttar Pradesh, the Chief Minister, Banarsi Das, may prove too independent and the support of the Union Minister for Petroleum and Chemicals, H N Bahuguna, is transient. Bahuguna is in fact utilising the anti-Jana Sangh-RSS campaign to refurbish his own image among the Muslims in UP following the Aligarh riots. Bahuguna the vaunted champion of the Muslims failed to visit Aligarh either during or after the communal riots and had thus courted disaffection among the Muslims.

Charan Singh also knows that a showdown with the Jana Sangh and Morarji Desai cannot lead to the fall of the government at the Centre since, apart from not having more than 25-30 Lok Sabha MPs with him, there is also Y B Chavan's reserve army of the Congress just waiting in the wings to align itself with Morarji Desai and the Jana Sangh. Charan Singh has also disowned Raj Narain, no doubt after having balanced all these considerations. Indications are that the Jana Sangh leadership would accept the compromise with Charan Singh. The proposed compromise will therefore suit the Jan Sangh leadership very well, on the one hand, and on the other, will concede to BLD elements posts in the organisation without elections. Without Charan Singh's support, Raj Narain's anti-RSS campaign will be a cry in the wilderness which will soon fade out. Besides, the present hardliness against the RSS have never been known for consistency on various issues.

The Jana Sangh leadership is thus committed to Morarji Desai's continuance as Prime Minister. The Jana Sangh is not at all the loser in such a contract. With its present strength *vis-a-vis* the other constituents in the Janata party, it cannot hope to lead the cabinet. With the long-term aims in view, it has never been in a hurry. It has to capture the organisation from below. The Jana Sangh's emergence as powerful force in the party's organisational elections in the states has cut the ground from under the feet of Charan Singh, Madhu Limaye, and such others in the Janata party. Using its position in the government at the Centre and in some states, the Jana Sangh has struck roots more widely. Knowing that Charan Singh is not really keen to participate in the ideological campaign against the RSS, Madhu Limaye has had to seek support of — barring his few Socialist friends, mostly former Lohiaites — the two communist parties and the Congress of Chavan. But while the CPI considers the campaign against the RSS grist for its mill and supports Limaye (especially in consideration of Limaye's pro-Soviet Union campaign of recent months), the CPI(M) will oppose the RSS without seeming to oppose the Janata party. Chavan as usual is expected to sit on the fence: In the 1977 election campaigns he used to warn: "Jana Sangh is RSS and RSS is Jana Sangh". Now he has not spoken a word against either the RSS or the Jana Sangh.

EDUCATION

Reducing Policy to Arithmetic

J V Deshpande

THE problems of the educational system in India have been reported time and again, even by specially appointed commissions such as the Kothari Commission and the Sargent Commission. The shortcomings of the present system have been mercilessly highlighted, and both short-term and long-term remedies have been listed several times.

Yet the only major change brought about in the past 30-odd years has been the introduction of the 10+2+3 pattern for school and college education. Even in respect of this change, its most essential ingredient, of vocationalising the +2 or the higher secondary stage, was quietly ignored by the state governments. The net result has been a new, mechanical, division within higher education, and the serious dislocation in the running of both high schools and colleges. A new category of 'Junior College Teachers', ineligible for the regular higher pay-scales, has also resulted.

The disruption has been worsened by the hamhanded way in which the state governments pushed through these changes in the mid-seventies. The enforcement of the Emergency in the country made it possible for the state governments to ignore the serious objections of the teaching community towards the new system. For, by then it was clear to the teaching community that, by not vocationalising the higher secondary stage, the main thrust of making the HSC examinations terminal in formal education was lost, and that quite contrary to stated goals the change had made it possible for the authorities to divide and exploit the teachers further.

With the Janata party coming to power and the ending of the Emergency, the need for fundamental reform of the educational system has again been talked about. Yet the debate has merely centred around the possible modifications to the 10+2+3 scheme, and half-hearted reformulations have merely meant alternative break-ups of the 15 years — such as 7 + 5 + 3 or 10+2+2+1, or 7+3+2+3, and so on.

The draft of the new National Policy on Education has been finally published and it was presented to the Lok Sabha. From the summary in the Press, it is clear that any serious reform of the educational system has been yet again set a side. The draft policy lists a whole range of laudable goals for the proposed New Educational System. No one can disagree with government's ostensible wish to vocationalise school education (particularly in later years), increase the facilities for non-formal education (probably meaning non-school education), emphasise adult education, modify the medical education to suit the real needs of the country, and improve the quality of post-graduate education (though, does it mean that government is happy with the quality of under-graduate education?) However, within the framework of the policies being pursued by the government, these objectives will remain mere platitudes.

For instance how is vocationalisation of education — the lynchpin of all reforms — to be brought about without a clear idea about the nature of the job market in the next decade or two? Moreover, the future job market can not be predicted unless the quantum and direction of public and private investments over the next few years are known. In a stagnant economy, with dwindling opportunities for employment in most technical and semi-technical fields over the past decade or more, it was no surprise that vocationalisation has proved a non-starter. A few schools in Bombay which started technical courses have therefore terminated them.

Nor are there any any reasons for expecting a difference in the near future. A young man entering the job market today knows too well that his best chances are in the public or semi-public bureaucracies, including in banks and other public organisations or in the offices of private companies. Not only are these jobs comparatively cushy and less demanding, they are generally the only jobs available No wonder most popular courses today prepare aspirants to scramble for the few such jobs.

If education were to be planned according to developmental priorities, priorities in vocational training seem clear enough. For example, with the constitutional requirement of porviding free and compulsory education to all children till the age of 14, it is obvious that the country would need all the colleges of education that it has — and more. The same thing can be said about courses in nursing, paharmacy, and various other medical auxiliaries, not to mention courses in medicine itself. In fact, however, Maharashtra government has recently ordered the closure of some colleges of education and of pharmacy in the state.

It is commonplace, too, that a large majority of the country's population is going to depend upon agriculture as its main source of livelihood for many years to come. It would be necessary, therefore, to train a large proportion of the potential jobseekers in agricultural techniques and in the artisanship associated with agriculture. However, without land reforms, increased facilities for training in agriculture and in allied vocations are unlikely to be used or to be effective. Even the introduction of an agricultural bias in school curricula will be a fruitless endeavour by and large.

In case of medical education too, though we have been hearing for a long time of the need to start short-term medical courses, to have barefoot doctors, etc, no government has at all attempted to put down the well-entrenched opposition to such proposals Even within the conventional framework, there have been no serious efforts to increase the facilities for vocational and technical training. In fact for about 20 years now, there has been no expansion in the facilities for medical or engineering education — though the student population in that period has more or less doubled. Paucity of funds has been the standard alibi and will likely continue to be one in the future.

Basic reforms in education can be introduced not in isolation but only when the government is willing to introduce significant changes on a wide front of the social and economic life of the people. Without this, there are strict limits to what a government can achieve in the educational field. In the mean time the same sterile debates about the merits and demerits of 10+2+3 as against 7+5+2+1 or some other scheme, will continue, so will debates about the two-language formula as against the three-language formula and so on. It is this kind of arithmetical jugglery that has come to be regarded as Educational Policy.

'Occupation' of a Tea Estate

Udayon Misra

SOCKLATING TEA ESTATE, situated about twenty kilometres from Jorhat, was the scene of some violent incidents on April 9 in which 11 persons died. The clash between the workers of the tea garden and an occupation force of about 150 men led by an Assamese businessman has led to much understandable outrage and calls for 'severe action' against the culprits. The common version of the clash is that the workers had been instigated by the former owner to prevent the local businessman from occupying the garden. Certain local chauvinist forces go one step further and argue that it is part of an organised assault by 'foreign' capitalists against rising Assamese capitalism. That the workers had been intolerably provoked — no pay for months, job insecurity, organised attempt to assault them on the part of the new owner and his family and hired hoodlums who had gone there fully armed — is conveniently overlooked and satisfaction is being expressed at the arrest of over a hundred workers who are now suffering the utmost repression in Jorhat jail.

Socklating, once a flourishing tea garden in Upper Assam has been plagued by severe financial troubles over the past few years with its debts and liabilities running to over Rs 75 lakhs in the form of unpaid agricultural income-tax, provident fund dues, loans from the Assam Co-operative Apex Bank and the Industrial Finance Corporation as well as heavy dues with the state electricity board. The sick tea garden was taken over in January last by the Assam Tea Corporation which has been managing it ever since. The takeover was generally welcomed by the workers, who had not received their wages and bonus for several months, because the ATC arranged for part-payment of workers' dues. Meanwhile, a part of the garden was auctioned by the state government for non-payment of revenue dues by the management. The highest bid was clinched by an Assamese businessman of Jorhat, Dharmeswar Kalita. The ATC appealed against the auction in vain, and possession rights were given to the new owner.

The new owner visited the garden twice, on March 28 and April 5, with the intention of actually taking possession but this was resisted by the workers who feared that under the new owner they might be deprived of their arrear dues. In fact, the new owner and his representatives had made it clear that since the garden had been bought in an auction, the question of paying arrear dues did not arise. This created a lot of tension among the workers who had already for some time been living under uncertain conditions. The new owner finally sought police help to occupy the garden but before this could be arranged, his sons collected a force of about 150 persons, mostly villagers and day-labourers carrying their implements, who were falsely promised work in the garden, and proceeded on April 9 to occupy the manager's bungalow. The sons were armed with more lethal weapons — three loaded guns.

The occupying force led by the brothers proceeded straight to the manager's bungalow which was locked. They had already met with resistance from the gateman who initially refused to allow them to enter without due permission. As they proceeded to break open the locked gates, the chowkidar present put up a resistance and the resulting altercation drew the attention of the workers who by now had gathered at the scene. Tensions began to rise and, apparently scared at being surrounded by the workers, someone from amongst the occupation force fired a few rounds from the gun. The guns were probably being carried by the occupants of the three cars that had followed the lorry carrying the invading party. In the ensuing clash, directed mainly against the new owner's family and its close friends, eleven persons including four sons and a grandson of the new owner were killed. Two guns were snatched by the workers who later handed them over to the officiating manager of the tea garden while one gun was recovered by the police from the spot of occurrence.

The attack seemed to have been concentrated on the occupants of the cars where the guns were being carried. Although other members of occupation party were also attacked, most of them received only minor injuries. The use of guns has now been denied, and some of those who accompanied the Kalita brothers say that guns were only fired into the air. This, however, is not borne out by facts. The two injured workers who were admitted to hospital tell a different story. Budhu Bawry, the gateman who rushed to the scene of altercation after hearing gunshots, was hit on the knees with a rifle-butt as a result of which he lost consciousness. Babul Mal heard the garden siren and ran to the scene to be hit on his forehead by a bullet splinter.

The state government has ordered a magisterial enquiry into the incident. Meanwhile, the Secretary of the Assam Tea Garden Tribes Students Union has accused the Assam Chah Mazdur Sangh, the INTUC-led workers union in the garden, of having betrayed the workers and has called for safeguarding of the rights of the workers. While the enquiry might reveal some of the facts behind the incident, certain questions persist. Did the new owner who had bought only a part of the garden attempt to occupy the entire garden including the factory? And why was an attempt made to take possession without the presence of the police although such police help was asked for?

EEC

Unloading the White Revolution

Narendra Singh

FOR the Third World, the 1960s was the decade of the highly publicised 'green revolution', while the turn of the decade into the seventies saw the focus turn to the 'white revolution'. The 'surplus' PL-480 wheat of the US was behind the promotion of the so-called green revolution; whereas Europe's 'surplus' of milk and dairy products has led to the promotion of the so-called white revolution. The diversion of these 'surpluses' to the Third World has been justified on the grounds that production is promoted by stimulating market-oriented capital-intensive ventures.

Historical experience, however, points to the adverse implications of such ventures for the life and the economy of Third World countries. Nevertheless, such ventures continue to be promoted under diverse liberal phraseology. Through such promotions, the ruling economic interests of the 'surplus' producing industrial world seek to mitigate the crises in their economies and to gain control over the markets and cheap resources of material and manpower in the Third World.

India, the most populous non-socialist country of the Third World, has received special attention for both the 'green' and the 'white' revolutions. We know that the green revolution has accentuated poverty and malnutrition, by promoting commodity agriculture and widening the disparity between the rural masses and the few rural rich. A white revolution, implying a flood of milk and dairy products, was publicised as the aim of 'Operation Flood' which was launched towards the end of the sixties. The reported failures in targets and progress notwithstanding, the project has received further support and has now entered what is called Phase II.

The most obvious consequence of the milk collection-based project has been decreasing consumption within the traditional milk-producing communities. Even more serious for the national and regional economies of the Third World is the growing infiltration by foreign capital and the increasing technological dependence of the Third World countries. To understand this phenomenon, we are primarily concerned, in what follows, with the situation of dairy production within the European Community.

European CAP and Dairy

The Common Agricultural Policy (CAP) of the European Economic Community (EEC) is evidently suffering from strains over the issue of production and price policy for milk and dairy products. It is argued that high CAP prices are pushing up dairy production and that dairy farmers are getting a bigger price rise than are the other farmers. The comparatively low price of foodgrains and other inputs thus encourages expanding production and creation of 'surplus'.

The surplus is augmented by the local consumption being discouraged by the high prices — which are twice the world market price for milk and three times for butter. The unwanted surplus for 1978 was estimated to be about 800,000 tonnes for skim milk powder and over 450,000 tonnes for butter. There is also the additional burden, on the EEC budget, of disposing of the surplus in export markets and in promotional aid to Third World countries. About £2 billion per year, or some £90 per EEC cow, are spent on such subsidies. This burden has to be borne by the common taxpayer of the European community. Since the EEC has member nations with uneven levels of development, the people of the poorer member countries feel the pinch of the high CAP prices and the high subsidies for exports.

Britain and Italy are reportedly two members striving for reforms in the CAP. Holland, Germany, France and Belgium are reportedly not in favour of the proposed milk price cuts and the income aids to small farmers in compensation. Both Britain and Italy are deficient producers and hence importers of dairy products, whereas the others are surplus producers. Britain produces only 11 per cent of its national consumption of butter and Italy 58 per cent, whereas Holland, Germany and France produce 393 per cent, 125 per cent and 112 per cent respectively, of their consumption.

It is alleged in the CAP reports, that the farm lobbies of the surplus countries are opposing the price reform proposals. But the farmers and their lobbies in such countries can never be politically strong enough by themselves, being only a small section. In fact, there is progressive displacement of the small farmers everywhere under pressure of capital-intensive and large-scale production. The real beneficiaries are the economic interests very much bigger and more powerful than the dairy farmers of the rich countries of the EEC.

Commercial farm production, including dairy, is very much subordinate to industry. One one hand, it is dependent on the farm-inputs industry and, on the other, on the produce-disposal industry. The most profitable and dynamic sectors in farm production are the industries which provide the vital inputs of materials, machinery and other requisites of increasing production, and the industries, which process and market the produce and the final products. The farmers are mere agents — a labour force for using the production inputs but having no control over their supplies. Nor have they any say in the disposal of their produce. The price-policy, for the farm produce as well as for the products sold to consumers, is thus determined not by the farmers but by the monopoly of economic interests who control the provision of inputs and the disposal of the produce/products.

Let us illustrate. Germany and Holland are two of the largest importers of animal feed. Between them, they account for more than a-quarter of the world feed market, their shares being 15 per cent and 11 per cent, respectively. Among the countries exporting dairy products, the two largest are France and Holland, with shares of 18 per cent and 19 per cent respectively, accounting for more than one-third of the world dairy export market. The Dutch dairy farmers, therefore, may be somewhat better off than the other farmers in Holland, and probably better off than the dairy farmers in, say, Britain and Italy. But the Dutch dairy farmers cannot be the main beneficiaries of the dairy 'business', comprising mainly the feed import and dairy export business. This includes the monopolies in manufacture and trade of materials, machinery, and equipment for production inputs (including feeds), and in subsequent handling of the produce in transport, storage, processing, and final disposal of products in local and export markets.

Feed from, and Dairy Exports to, Third World

There is extensive promotion of food production in the Third World, through foreign capital investment and assistance programmes, and through support to indigenous research and development. Special attention is given to the potential feed crops in the sunny-wet and semi-arid tropics where there are cheap resources of labour and land. There is no substantial increase, however, in the local use of food or feed materials. Instead, the supplies of quality feed materials to the industrial world have been increasing.

A recent example is the several-fold increase in the imports of cassava from Thailand into the high-cost countries of Europe during the last four years. Import of feed cassava into low-cost Britain has not increased. In Britain, it is no cheaper than the local feed grains. However, Britain's imports of high-starch compound feeds, allegedly based on cassava, are reported to have gone up within a year to 40,000 tonnes a month from nothing in the winter of 1977-78. The fact is that cassava in Thailand, palm plantations in Indonesia and Malaysia, and various feed crops in other Third World countries, together with associated research, have been promoted through international, multilateral and bilateral programmes. Overt and covert control over such feed resources, as well as over the whole gambit of related activities including compound feed manufacture, is indeed one of the most profitable business in European dairy production.

At the other end, export of surplus dairy products into world markets is heavily subsidised. The economic and political characteristics of food as aid are also well known. The US economic interests have fashioned the PL-480 Food for Peace programmes. Their significance in the recent times has markedly increased — as is evident in the East-West trade deals and the heavily subsidised export of butter, etc, to the USSR. The implications of the dairy products assistance to Third World countries are clear in the proliferation of milk processing and milk products manufacturing plants in India. This has happened through local manufacture under import of machinery and equipment mainly by foreign collaboration or foreign subsidiaries. These plants have operated at 50-60 per cent capacities, and milk production has remained low. Nevertheless, the number of the milk processing and milk products manufacturing plants has gone on increasing under promotional campaigns. This, after all, serves the business interests dominating the manufacture of dairy plants and equipment in the industrial world. Expanding the market for technology and for products consumed by only the small affluent section in the Third World, is nevertheless highly profitable business.

Similarly, we may refer to a recent donation of an abattoir by Denmark to an internationally famous premier research institute in India. Even before the equipment was unpacked at the institute, the Danish industry had sold several abattoirs in South and South-East Asia, simply by advertising the acceptance of the abbatoir by the Indian institute.

As for the subsidy for export or the aid promotion under the EEC budget, this of course comes from the taxes paid by the common man. In essence, then, it is public funds for expenses and private profit for return. The common taxpayer bears the cost of the subsidy or aid, while the corporate business interests derive the benefits in profits.

Thus, though high consumer prices and high EEC budget expenditure are alleged to protect European agriculture, such protection benefits not so much the farming population of Europe. As revealed in the distribution of the European Agricultural Guidance and Guarantee Fund (FEOGA), the expenses for 1974 were as follows: Italy with 41 per cent of the EEC farm population received only 16.8 per cent of FEOGA, while Holland with only 4.2 per cent of population received as high as 14.6 per cent of the FEOGA. Clearly, the FEOGA allocation had no relation to the size of the farm population. Again, a product-wise breakdown of expenses is as follows: Milk and milk products got 39.4 per cent of the guarantee spending, beef and veal 10.5 per cent, while cereals only 12.9 per cent, and tobacco and sugar 5.9 per cent and 3.5 per cent, respectively. Out of the dairy allocation, Italy got about 2 per cent, and Holland the largest share of more than 20 per cent.

Clearly, the most profitable business in the European agriculture is animal production, and within it dairy production. Dependence on local feed resources, with their inefficient conversion, would have made animal production unattractive. The profitability of dairy business is hence based in a big way on the cheap feed resources from the tropical and semi-tropical Third World. Additionally, subsidised exports of the surplus dairy produce open up vast vistas for markets — for equipment, technology and investment in the Third World. Proliferation of plants — in spite of the acute under-capacity operations aimed at only the small affluent markets of the Third World — are most profitable. Moreover, high consumer prices within Europe and high public expenditures for the disposal of the surplus make the dairy business indeed very attractive.

The dairy farmer thus appears to be a fringe beneficiary of the profits of expanding dairy production. In reality, the dairy farmer and the industrial worker, as all other common people, pay towards making the business profitable.

What Next in Family Welfare?

D Banerji

THE mass sterilisation drive during Emergency, when a reign of terror was let loose on the poor, had been ,a most outrageous chapter in the history of India. Even more outrageous was the response to this move from the educated class/and other shapers of public opinion. Very few of them felt exercised enough at the outrage to express their dissent even to the extent that was allowed by the rules, regulations and laws prevailing during Emergency. Many of them enthusiastically supported the move and still larger segment of this class, while expressing a tinge of regret that so much of force had to be resorted to, actively justified such an action on the ground that under the circumstances this was the only way of dealing with an explosive problem which was threatening the very life of the nation. Then there were the rest, constituting the huge 'silent majority', who did not even bother to find out what was going on in the country and were content with whatever was dished out to them through the controlled press, the radio and other communication media.

In fact, the perpetrators of Emergency misdeeds ventured to go so far as they did because they realised that the bulk of the so-called conscience-keepers of the nation were at least not averse to if not active promotors and instigators of their actions. These conscience-keepers, who so enthusiastically promoted and conducted the forcible sterilisation campaign, were found grossly wanting not simply on political and moral planes; they failed miserably in the much more mundane plane of administration of the mass sterilisation drive in not anticipating the administrative backlash of a punitive action on such a mass scale. This fact must be taken into consideration in planning future action in the field of population control.

The failure and subsequent abandonment of the mass sterilisation programme was a most expensive failure in terms of cost, human suffering, generation of antipathy for the programme among the people, and acute demoralisation of hundreds of thousands of family planning workers. The concerned decision-makers should squarely be held accountable for a disaster of such a magnitude which has brought about a basic qualitative change in the perception of the programme by the people. As a result, it is now even more difficult for a mere rehash of the same old approach to carry much conviction with them. But, while the political leaders and planners have kept on the refrain that the need for control of population growth is much too urgent to brook any delay, astonishingly, they have conveniently overlooked all these years the fact that the very urgency of the problem calls for urgent action to bring about a basic change in the organisation of the family planning at all levels — at the level of policy and programme formulation, programme implementation and programme evaluation. It will indeed be tragic if even now, decision-makers and planners do not see the clear writing on the wall: that a mere rehashing of the old and repeatedly discredited cliches — education, population education, mass information campaign, target orientation, incentives and disincentives, use of force, utilisation of voluntary agencies, etc — simply will not work. Unfortunately, the Draft (1978-83) Plan presents a mere rehash of the same old concoction which has repeatedly been proved not only to be inadequate, but downright counterproductive.

Formulation of a population control policy (as a part of a more comprehensive population policy) which is based firmly on the premise of having a birth control programme as a component of a larger composite programme package which is aimed at improving such conditions as health, nutrition, education, employment, social relations and political participation of the oppressed sections of the population, may take some time. But, it is possible to make some concrete proposals for a rejuvenated family welfare programme for inclusion in the finalised Plan document.

First and foremost, there is to be a basic qualitative change in the mechanism of decision-making through changes in the criteria for selection of programme administrators, leading to changes in the style of leadership. Instead of adopting the approach of talking down to the people through person-to-person education, population education, mass media, exhortation, brow-beating, enticement, administrative coercion or even more naked use of police force, they should learn first to listen to the people and then formulate their action programmes. This requires a basic change in the 'culture' of the leadership: their entire world-view.

By adopting this perspective or starting from the people, it might turn out that at a time when the official family planning performance data show such a steep downward trend, there are many in the community who are actively clamouring for family planning services, but the services are not accessible to them. Demonstration of presence of such 'felt-need' could itself be a strong enough indictment of the organisation and management of the family planning programme.

The present demoralisation of family planning workers is a direct consequence of some basic short-comings in the administrative leadership at the highest level. A change in the culture of the top leadership is, therefore, a fundamental prerequisite and should lead to basic changes in the organisation and management of the programme. For instance, organisationally, it should lead to a review of the place of generalist administrators at the top level and also the quality and competence of the so-called family planning specialists who occupy key positions. These organisational changes should lead to better management in the form of better planning, better programme formulation and a more effective implementation and evaluation. In turn, this should lead to qualitative improvements in the organisation and management of the specific institutions for evaluation for research and for training and education of family planning workers.

At the operational level, improvement in the organisation and management should lead to reorientation and rejuvenation of the services. This should be reflected in the form of:

(a) Increasing the community outreach of the services so that they are able to meet the unmet felt needs for family planning services in the community

(b) Giving a more tangible evidence of integrating birth control activities with the other health services including the maternal and child health services, which should also encompass Integrated Child Development Scheme

(c) Further widening the range of family welfare activities by specifically including indices on the progress of various poverty alleviation programmes (including

the revised minimum needs programme) for measuring the progress and effectiveness of family welfare activities.

Launching of the Community Health Workers Scheme is a decisive step towards developing a people-oriented health service for India. However, to give a real meaning to the slogan, 'People's Health in People's Hands', the leadership should ensure that:

(a) Active steps are taken to see that the programme is not allowed to be bureaucratised and adequate democratisation is promoted in the rural populations so that the weaker sections also have an active say in the decisions concerning the health and other problems of the community.

(b) Much greater efforts are made to work out much more realistically and scientifically the role of the community health workers and to provide suitable training to them.

(c) The entire medical and health establishment, from multi-purpose workers to the very top, is made to realise that it is meant to support the work of the community health worker, that the CHW symbolises the aspirations of the community, that all categories of health workers are subordinate to the aspirations of the people, and that the CHW is just the lowest rung in the bureaucratic hierarchy.

The above approach also provides a framework for inducting newer technology into the programme. However, it is important to ensure that it is the programme needs which determine what type of technology will be inducted and not the other way round, as, for instance, had happened in the case of induction of the IUD or the mass communication drive in the programme in the past. The tail must not be allowed to wag the dog. There is a great temptation to think that some sort of 'technological fix' in the field of mass communication, or in the form of discovery of a new contraceptive, will miraculously provide a solution to India's population problem. Such wishful thinking is not conducive to developing a sound strategy for dealing with so urgent and so complicated a problem as population explosion. Past experience has repeatedly shown that it would be utterly simplistic to harbour such expectations.

Incidentally, considerable groundwork has been done in the Department of Family Planning in 1976 by formulating a national family planning communication policy, as a sub-system of the bigger population control policy which was based on the dictum, Development is the best contraceptive. This provides valuable material for further developing ideas on the place of mass communication in family planning.

Decentralisation of the programme should be actively promoted, instead, of being resisted. If some state governments cannot be depended upon in implementing the Minimum Needs Programme, then they also cannot be expected to faithfully implement a centrally-sponsored programme. Furthermore, does the central leadership really carry conviction? Does the Union Health Ministry possess adequate number of managerial personnel who can carry conviction with rugged state public health specialists, who had spent, say, 25 years doing public health work? Moreover, instead of treating the symptoms, the disease itself should be treated. If the Central government does possess competence, it should get involved in actively promoting such competence in the state, both at political and administrative levels, rather than taking upon itself the task of doing work which it thinks others are incapable of doing.

In the so-called voluntary sector, the Community Health Workers Scheme, which is based on generation of health activities from amongst the villagers themselves, should form the core. Over and above, if there are other self-financing voluntary agencies which are found capable of making contribution to the programme, these should be encouraged. The agencies, which claim cent per cent grants from the government or other agencies are, in fact, not voluntary agencies, they are merely contracting agencies which promise to deliver certain services on payment and they should be treated as such.

Obviously, the above approach for immediate action had to be based on certain policy assumptions. These assumptions provide at least a tentative outline of a possible population control policy for India.

Actions in the field of population control must start from the level of the people, as opposed to the prevailing approach of talking down to the people from pre-determined value positions.

Effective and socially and culturally acceptable birth control services should be made accessible to the community to meet the pre-existing felt-need for such services and to meet the additional need that is likely to be generated as a result of intervention in other social and economic sectors.

The birth control activities should be totally integrated with other health, nutrition and child development activities.

Active steps are to be taken to create conditions that generate motivation for a small family norm in the community — eg, programmes aimed at reducing social and economic inequalities, education, particularly education of women, improvement of social and economic status of women and promtion of democratic institutions. Therefore, quite apart from the importance of these programmes on their own, achievements in these programmes should be considered as indispensable for achievements in the field of population control. The responsibility for controlling population growth must, therefore, transcend the Department of Family Planning, or even the Ministry of Health and Family Welfare, to cover all the ministries at the Centre and in the states that are concerned with action programmes that generate motivation for a small family norm.

The Union government should actively promote decentralisation of all aspects of population control work — policy formulation, planning, implementation, evaluation, research, training and education.

A population control policy is a critical component of a much wider population policy. A population policy also includes such issues as migration, employment, housing and urban-rural population distribution. However, the degree to which population growth can be regulated and is actively sought to be regulated has a major bearing on the other components of a population policy, in fact, on the entire process of planning for social and economic development of the country.

Fresh Perspective on Industrial Workers

N R Sheth

South Indian Factory Workers: Their Life and Their World by Mark Holmstrom; Allied Publishers, New Delhi, 1978; pp xii + 158, Rs 25.

SOCIOLOGICAL studies of Indian industrial workers have varied from impressionistic generalisations to sophisticated intensive and extensive researches in various aspects of the subject. Scholars interested in urban-industrial India have dwelt at some length on issues such as the social consequences of industrialisation and workers' commitment to industrial jobs and the industrial way of life in the context of thir perceived attachment to traditional institutions such as extended family, caste, religion and a value system believed to be oriented to the rural agricultural ethos of Indian society. For some time it was fashionable to argue that there was an inevitable incompatibility between modern technology and traditional Indian institutions and values. As empirical studies of industrial workers in urban centres grew, it was first realised and then shown by data that loyalty to traditional institutions did not seriously hamper workers' acceptance of industrial jobs and the value system implied in them. An academic debate on the so-called problem of commitment of Indian workers has been going on for over two decades. Commitment is usually measured by scholars in terms of the concepts of work adjustment, job satisfaction, motivation, attitudes, etc, formulated in relation to industrial workers in more developed societies. It is generally assumed that modern technology and the logic of industrialism are the phenomena of the future making demands on tradition-bound workers. Workers themselves are usually regarded as passive agents, accepting, rejecting or partially accepting the norms of religion, caste, family, urban society, modern technology and such other institutions. A worker is rarely seen as an active partner in the social reality around him, living through unique situations from time to time, and operating on his social and industrial environment by choices of his own.

Holmstrom's study of factory workers in Bangalore is a refreshing departure from the beaten track in the sociology of Indian workers. In an attempt to develop what he appropriately calls 'anthropology of urban work', the author explores various facets of behaviour and attitudes at work and in the wider social life of 104 factory workers employed in four large factories (two each in the public and the private sectors) in Bangalore. In the typical style of an anthropologist, the author is concerned with the background, the social networks and the experiences of the workers with a view to bringing out the similarities and differences among them in a sociologically intelligible way.

Salient Issues

The study is set within the framework of some salient issues regarding industrialisation in India. Do workers show a greater degree of commitment to paternalistic management style which may signify a breach between traditional Indian society and modern industrial societies? Are workers in the organised sector a privileged group thriving at the expense of their less fortunate brethren in the unorganised sector (a question which is now conveniently raised by the more privileged bureaucrats, politicians and citizens who seem to be upset by the growing militancy of workers in the organised sector)? Are there viable alternatives to high technology industrialisation? The author is aware that a small piece of research such as his cannot lead to sufficient enlightenment on these larger questions. It may, however, be useful to note that he recently spent several months in India to follow up his questions, especially the relationship between the organised and unorganised sectors of Indian workers.

Holmstrom's analysis of the caste, religious and linguistic composition as well as educational and salary levels of the Bangalore workers suggests that these workers represent the relatively more urbanised, younger, culturally heterogeneous and middle-class oriented work-force in industrial towns where modern industry with advanced technology has been growing rapidly. Workers who have migrated from rural areas hardly feel uprooted or alienated in their work and social life. Although many of them retain social and economic ties with kinsmen and castemen in villages they behave clearly as urban industrial people in Bangalore. They usually look upon factory jobs as a means to improve their social and economic prospects and hence show little concern for the romantic nostalgia for life in the countryside eulogised by some poets and social scientists.

The workers are divided into religious, caste and kin groups and manifest some behavioural and attitudinal patterns associated with these groups. But these have very little to do with the elaborate exclusive norms and values conventionally attached to such groups. Caste, for instance, is used as a field to find marriage partners, as a network of contacts to get things done or as a bogey to explain one's failure to secure a job or promotion rather than as a vehicle for social hierarchy and exclusiveness. Social contact plays an important role in recruitment and managements have interest in appointing those whose friends and relatives can vouch for their good behaviour. However, final recruitment of an applicant is based largely on merit. Workers on their part also stress merit as a fair method of recruitment and thus seem to reject the dominant traditional justification for inequality based on caste.

Contractual Relations

The author has done well to show that employment relations in the factories are contractual rather than paternalistic. Nobody looks upon a factory as an organised community as the Japanese workers are known to do. The workers are moulded in the style of aspiring lower middle class with a self-image of conscientious work. Such observations may appear common place to those who deal with factory workers of the type studied by Holmstrom. However, it would be interesting to compare the behaviour and attitudes of such workers with those in places like Bombay, Calcutta, Madras and Faridabad where lower-middle class workers have become notorious for their unwillingness to work conscientiously. Is such behaviour rooted in the social context of industrialisation in the various places? Is it due to the nature and quality of trade unionism at various places? Is it due to the behaviour of employers and managers? Comparative studies of industrial workers on these lines would be extremely useful academically as well as practically. Existing sociological studies on

the subject are quite inadequate in this respect.

In a chapter entitled 'some careers', the author has tried to reconstruct the job-related and social experiences of some of his respondents. He takes into account the fact that there are as many ways of organising the workers' experiences in an intelligible whole as there are people. However, the sociologist in him is interested in bringing out the significant similarities and differences between individual accounts and suggesting a typology of workers. As far as I am aware, such an attempt to propose an empirical typology of industrial workers in India on the basis of live interview data has been made for the first time in this study. Holmstrom has discussed some special problems in handling such data and the methodological as well as ideological problems inherent in such an exercise. Reference is also made to the limitations inherent in the attempt by a foreigner to collect, organise and interpret such interview data. All these aspects are discussed crisply, unostentatiously and as an integral part of the main analysis.

Behaviour and Outlook

The workers are divided into eleven different types in terms of the dominant characteristics of their behaviour and outlook. For instance, one type of workers are called "paternalists" as their dominant trait is an ideology of loyalty to management. Another type is described as "militant unionists" who are dedicated to the interest of the working classes. The third type consists of those who use the trade union as an alternative career ladder. Another type is labelled as idealistic, reforming middle class factory workers who expect some promotion and share an ideology of moderate social reform and service to the nation. Yet another type is designated as "no alternative" workers who have hardly any chance of employment outside the present job and also little chance of promotion in that job. Some stick to the present job as they know that it is socially and economically better than any alternatives they may be able to hit upon. Then there are workers who have got jobs because they are the kith and kin of factory owners. Some are guided by the ideology of personal achievement and hence may put in special effort to rise in their employment. Some treat factory employment as a step or incident before they start their own career by establishing their own industry or business. For some workers, job and career are parts of an overall social or religious interest. Some employees (especially Harijans) look upon their jobs mainly in their context of the common interest of their community of birth. Some Lingayat workers project a value system similar to the Protestant ethic as their religious values stress a character which is described as "ethical, conscientious, meticulous, moderately ambitious, equalitarian in principle but conservative in practice" (p 120).

In the accounts of these various types of workers, the author indentifies a common theme of the organised sector as a citadel of security and relative prosperity. He also identifies a common contrast between personal advancement and security from which workers make choices according to their social predispositions.

In the context of this typology, Holmstrom attempts to analyse the structure of careers from the workers' point of view, taking their categories and distinctions as a starting point (p 122). With commendable sociological craftsmanship, he has tried to highlight the interconnections among the crucial aspects of the social world of the workers in the three time spheres of job, career and lifetime. For instance, paternalistic workers from higher castes regard their job and career as closely interlinked. Hierarchy of jobs is justified in the interest of the social whole of the organised sector. The social outlook on lifetime (which is linked with the family's development) is discreet from that on job or career. Hence social choices (as in marriage) are hardly affected by career choices. On the other hand, for the militant unionists career is wider than job. In career, fellow-workers outside one's job situation as well as other managements in the organised sector play an important role. Their social world of lifetime includes the working class and is linked with the spirit of socialism rather than the welfare and growth of their own families. Corresponding observations and interpretations are made for each type of workers as developed by the author. This is an interesting approach. It provides depth to the typology of workers in earlier chapters. But the reader is likely to get lost in the attractive maze of sociological analysis. The simple characters mentioned in the previous chapter now attain a certain degree of mysticism. However, the attempt is certainly a contribution to the development of a functional methodology in urban and industrial anthropology.

Choice and Equality

At the end, the author argues that Bangalore factory workers are a privileged lot. Their affluence is shared by their dependents in rural areas but not by the rural masses. For those workers who have landed factory jobs, factory work is a protected area of security and relative prosperity. These workers develop a middle-class image and tend to regard themselves as closer to management. Many of them have to struggle to get a job and, having got it, they want to retain the security and prosperity implied in it. In the background of this conclusion, the social and economic bonds between labour aristocracy and the rest of working classes need to be explored further in specific local settings. For instance, it is necessary to find out the implications of the activities of industrial workers for the economic profile of semi-urban and rural areas to which they are linked in various regions of the country.

For several types of workers, job, career and lifetime are closely interlinked and also linked to their personal and family development. On the whole, the workers make economic and social choices in their career paths although for most such choices may be fairly limited. One important moral of the story however is that these workers do not fit into the model of a passive social animal whose choices are governed by some pre-existing social organism. Interestingly, the author argues that the social and economic choice available to industrial workers is not necessarily a gift of changes connected with modern industrialisation in India. Drawing on other sociologists, he points out that traditional Indian society has been characterised by two models of behaviour and outlook. In the main classical model man's life has meaning to the extent that he identifies his will with his role in social organism. This model has from time to time been attacked by social and religious groups who represent the second model and who have recognised the importance of individual choice, social equality and flexibility in social structure. This tradition of choice and equality which has so far been marginal in Indian society, the author argues, is now becoming central as it is more relevant to the situation and aspirations of the new classes of people such as industrial workers.

Oilseeds : A Comprehensive View

B L Kumar

The oilseeds Economy of India by P S George, Uma K Srivastava and B M Desai; The Macmillan Company of India, Madras, 1978; pp x + 274, Rs 35.

THE vital role that the oilseeds play in the country's economy needs no emphasis. With a current production of 12 million tonnes, valued at Rs 2,400 crores, oilseeds constitute the second largest agricultural crop, after foodgrains. Despite this the country has not yet attained self-sufficiency in vegetable oils and fats. The net gap between supply and demand in respect of oils and fats has been continuously widening for the past few years. The government has depended on imports to bridge the gap but, the country being short of foreign exchange, imports have had to be restricted. To the extent it is not possible to meet the entire demand for a certain agricultural commodity from domestic production and imports, equilibrium between supply and demand comes through price rise. Such increase, being inflationary, is not congenial to overall agricultural development and growth of the economy. It is, therefore, important that in the planning process, the course of demand for and supply of oilseeds should be projected as realistically as possible and attempt should be made to match these at different points of time with a view to identifying the magnitude of the likely gaps and the resources needed to fill these gaps.

Only on the basis of such an exercise of supply projections, is it possible to have a clear picture of the areas in which production efforts have to be stepped up and to formulate plans for optimum allocation of resources to the various production programmes.

In our country, the Five-Year Plans have however provided a long-term view of the supply position in respect of major agricultural commodities. In addition, individual research workers have also provided demand and supply projections for certain commodities and regions. In most of those exercises, oilseeds have been considered all in one group.

This is the first book which provides an analysis of past trends in supply of individual oilseeds and estimates production possibilities for different oilseeds at a disaggregated level in terms of major oilseeds-producing states. Apart from the established oilseeds such as groundnut, sesamum, castor, linseed, rapeseed, mustard and other non-traditional oilseed crops like soyabeen and sunflower, other vegetable oil crops like coconut, cotton, cottonseeds, rice bran, maize corn, oil palm and other oil bearing herbs, shrubs and trees are also included in the analysis.

The other important features of the book include the following: (a) Based on an analysis of past trends, projections are made for the year 1985, which provide a basis for the development of viable oilseeds processing industries and also for identifying alternative policy measures for increasing the supply of oilseeds. Estimates of supply possibilities of different oilseeds in the intermediate year of 1980 are also given. (b) Since supply projections of agricultural commodities pose complex theoretical problems and practical difficulties, the methodology used in this book is based on a judicious analysis of various approaches available for supply projections. Instead of depending on a single approach for all commodities, a conscious choice is made from the available alternative procedures. In cases where more than one approach is applicable, an attempt has been made to compare the results derived through different possible approaches. (c) As the oilseeds supply position is likely to be influenced by a number of institutional support arrangements relating to oilseeds production, marketing and utilisation, research and extension and arrangements for inputs supply, government policies and regulations, etc, an attempt has also been made to highlight some of the important aspects of these institutional support arrangements for oilseeds. (d) The recapitulation of major findings in chapter two of the book under the heading 'Projections at a Glance' provides a consolidated picture of likely supply potentials in respect of each oilseed for ready reference.

However, due to the multi-dimensional nature of issues involved in projection work, it is possible that the actual supply might deviate from the projected level even if the projection models are perfect and co-efficients in respect of economic determinants of supply reasonably good. Again, the actual supply may turn out to be different from the projected level not because of any shortcoming in the underlying assumptions but because of the emergence of new factors in the economy. It may also happen that the actual supply may turn out to be of the same order as protected supply even though the assumptions underlying projected supply do not come true individually but the deviations from projected trends are counterbalancing in nature so that their net effect is such that supply does not change. In spite of all this, the functional role of the projections may be said to have been fulfilled even if the problem areas are identified.

On the whole, the book provides a comprehensive analysis based on data scattered over a vast number of journals and other documents; and it delineates alternative approaches in developing supply projections and also identifies the most reliable forecastes The objectives are well defined. The analysis of the information collected has been scientifically done, presented and discussed keeping in view the needs of the industry.

The figures of the area under all oilseeds given on page 3 in Table 1.2 if summed up comes to 23,817,000 hectares, whereas in the text on page 2, at the beginning of the para two, the figures mentioned is 24,914,000 hectares. Also in the diagrams on page 5 the caption is missing. Nevertheless, the publication is of great use to specialists as well as persons engaged in planning for the development of the oilseeds industry.

Education and Unemployment of Professional Manpower in India

K V Eswara Prasad

This paper examines the influence of several factors on the unemployment of highly qualified manpower. It does so using multiple regression with dummy variables.

Taking a sample from the 1971 Special Census on Degree Holders and Technical Personnel, first an attempt is made to study (a) the incidence and (b) duration of unemployment by detailed tabulations; and secondly the duration of unemployment is further analysed by fitting an unemployment function.

The results support the following findings: (i) given a comparable length of exposure to education, the duration of unemployment varies significantly among the different categories of professional manpower (viz, *scientists, engineers, doctors and agricultural and veterinary scientists); (ii) in each category the duration of unemployment is less among those with higher academic performance than those with lower academic performance; and (iii) the females face a longer duration of unemployment compared to the males.*

AN impressive increase in the stock of highly qualified professional manpower has taken place in India in recent years. However, at the same time the unemployment rate among this category of persons has been steadily increasing, despite the restricted admission into the various courses in engineering, medicine, etc.

There have been few attempts at systematic study of the problem of unemployment among highly educated manpower in India.[1] The absence of even proper tabulations of the existing data on unemployment, and the need for the same, are clearly stressed in the Report of the Committee of Experts on Unemployment Estimates, which says that:

> for the purpose of the policy-making, it is necessary to know not only the nature of the observed unemployment and the number of those affected in each category, but also... the age group and educational equipment of the unemployed, whether they are seeking job for the first time, ... the length of their working period, etc. Information on some of these qualitative aspects of unemployment is already available from several surveys.... What is therefore needed is simply more systematic tabulation and proper interpretation (1970: 4).

And Blaug studying the unemployment problem in developing countries concludes that:

> data on unemployment in less developed countries are worth little unless they are cross-classified by age, education, and duration of unemployment.[2]

One purpose of the present study, therefore, is to investigate this problem by endeavouring to answer the following questions: What is the overall experience of the highly qualified unemployed manpower in reference to (i) the incidence of unemployment; and (ii) the duration of unemployment? How does the incidence of unemployment differ among those with various educational qualifications? Does it differ with age, sex, etc? Similarly, how does the duration of unemployment vary with age, education, sex, and such other characteristics? Further, a second purpose of this study is to identify the significant factors associated with the duration of unemployment among individuals with various educational qualifications.

The specific plan of the paper is as follows. In Section I, an attempt is made to review the different hypotheses regarding unemployment of educated manpower in India. This would promote an understanding of the educational and labour market phenomena in a less developed country like India. Section II presents the incidence and duration of unemployment through detailed tabulations. The category of unemployed is cross-classified by educational qualifications, academic performance as denoted by divisions obtained in the highest examination passed, age, and sex. In the third Section the duration of unemployment is taken up for further investigation by means of multiple regression analysis. It has some policy implication, though it is difficult to make any policy suggestions from the present sample as it contains only a highly educated labour force. This is a static analysis from the supply side; such analyses at regular intervals of time will be of much value along with other economic factors, to understand the supply of and demand for professional manpower.

I

The problem of unemployment has always been of great concern to the Indian government and planners. A number of committees, and individual researchers have probed into this problem from time to time. It is beyond the scope of the present paper to review these studies.[3] What is attempted here is a brief yet critical review of two schools of thought on the causes of unemployment which are clearly distinguishable. One school considers the educational system as the villain, whereas the other considers the economic system as the primary cause of the phenomena. They are however, not mutually exclusive. The distinction is based on prime emphasis given to the primary cause. For want of better terms, they may be named the 'mismatched education hypothesis' and the 'economic maladjustment hypothesis', respectively.

Mismatched Education Hypothesis

Those who are advancing the mismatched education hypothesis argue in the following manner: education as it is managed and imparted in India, is largely irrelevant and unrealistic.[4] It is not only bookish, but is also completely examination-oriented, where students are keen only in obtaining the credentials It develops no skills which could be used either in agriculture or in in-

dustry. As a result, the educated are to a greater extent unemployable. The values and attitudes imparted through the present educational system are such that all the educated want white-collar jobs with high salaries and bright promotion prospects. They are unrealistic about the job market conditions in India. Thus the unemployment problem is essentially one of a mismatch between job expectations generated by the educational system and job opportunities provided in the labour market.

The policy implication according to adherents of this hypothesis is that education should be made vocational. This aspect was analysed by Foster with respect to Ghana. He denied that vocational education provided within the formal educational system could solve the problem.[5] In India, the available evidence, though inadequate, indicates that vocational education will lead to more unemployment — for instance, many of the Industrial Training Institute trainees face the same problem of unemployment;[6] and even among those who are employed, many are in jobs that do not require the skills they have acquired. According to the Planning Commission:

> A survey of trainees in engineering trade from various Industrial Training Institutes in the country in the year 1965 conducted by the Director General of Employment and Training revealed that 39 per cent of the craftsmen were unemployed. About 17 per cent of the employed trainees were engaged in trades other than those in which they were trained.[7]

Since data on all sorts of qualifications are not included in this study, it is not possible to state categorically whether or not vocational training itself is a significant cause of unemployment.

ECONOMIC MALADJUSTMENT HYPOTHESIS

The advocates of this school of thought put the blame on the labour market functioning to explain the causes of unemployment among educated manpower. The labour market is full of imperfections and it does not react to the supply and demand conditions. This is particularly so since the actual demand for and supply of labour are never well matched, a consequence of which is either a shortage or a surplus. When the labour market is imperfect, it is not restored to equilibrium within a short time lag.[8] In India, some evidence has been gathered by Blaug,

Layard and Woodhall to support the view that the labour market does respond to supply-demand conditions, but this response however, is not speedy enough to bring about equilibrium, and unemployment is but a result of this.[9]

When it is very difficult to find a job, and also when the difficulty is increasing, why do more students demand higher education? It is natural to assume that they are completely ignorant of job opportunities in the labour market which is implicit in the 'education hypothesis'. If this assumption is verified by evidence, there would be a case for changing the educational system. However, if students/parents are aware of the job market conditions and are informed about earning prospects of being educated, then, when one compares the costs students incur to obtain a degree from the University and the resulting additional earnings when he finds a job, one finds that the returns to college (higher) education are profitable even after adjusting for a period of unemployment.[10]

The returns to higher education are due to considerable earning differential by educational category. The imperfect market does not react to adjust to over-supply and so earnings are not only sticky but "have never declined fast enough to erode the financial incentive to acquire still more education".[11]

The policy suggestion on the unemployment problem, according to this school of thought, is that the attack should be directed to the labour market and that the cost of acquiring higher education should be increased.

It should be mentioned that everyone who has tried to investigate the problem agrees that it is complex and requires a set of reforms. According to the International Labour Organisation Report on Kenya, The root of the problem lies in the interaction of the conventional educational system and the wage and salary structure through the allocation of jobs and wages by reference primarily to educational qualification.[12]

II

(1) *Data Base and Definitions:*

The data used in this study are for 1971 and refer to all India. Along with the 1971 Census, another survey was conducted by the Census of India at the same time using a special card — 'the degree holders and technical personnel card' — to collect information about all degree holders and technical personnel available in India.[13] The cards collected amounted to about 2.2 million.

The purpose of the survey was to gain an understanding of high level manpower, their stock, utilisation, and their labour market behaviour such as mobility, migration, earnings, etc.

The scientific and technical manpower division of the Council of Scientific and Industrial Research has collected most of the information on Scientific and Technical Personnel from the Degree Holders and Technical Personnel Cards and put them on magnetic tapes. These tapes contain information about scientists (physical and agricultural sciences), and veterinarians, having master's degree and above, and also about doctors and engineers having bachelor's degree and above. Persons with other qualifications have been excluded in the CSIR tapes.

A small sample of about 3 per cent of the entire observations available from the Council of Scientific and Industrial Research tapes forms the data base for the present study.[14]

It should be mentioned that the 2.2 million observations collected through the 1971 survey do not measure the entire stock of high level manpower. this is because not all the people with degree or diploma in technical or scientific subjects have responded to the questionnaire-card. The Planning Commission has estimated that the overall response rate might be between 60 and 70 per cent with considerable variations among the various fields of study.[15]

There is no way of ascertaining whe-

ther the non-response is randomly distributed in a given category or whether it is biased: the results of the analysis should be treated as applicable only to the sample under study.

The professional manpower is usually defined in terms of occupations (or profession) though the incumbents of the occupation (or profession) usually have education at master's or doctorate levels. However, due to data constraints it is defined here in terms of qualifications. The professional manpower covered in the present study possess the following qualifications: Bachelor's degree in engineering and technology and medicine; master's degree in science, agriculture, veterinary science, medicine and engineering and technology; and doctorate degree in all the above fields excepting agriculture.

In the present study, only those belonging to the category 'unemployed seeking job' have been considered unemployed and the incidence and the duration of unemployment observed here refers only to this particular category.[16]

Usually, the unemployment rate is expressed as a percentage of the labour force which is the sum of the unemployed and employed. Tables 1 and 2 present the age, and activity status for the whole sample classified into males and females. It can be seen that 5.4 per cent of the males and 7.6 per cent of the females reported to be unemployed. The incidence of unemployment is 5.9 per cent among the males and 9.4 per cent among the females.

It can be observed that when unemployment is expressed as a percentage of the labour force, the incidence of unemployment is found to be higher, particularly for the younger age groups and the 'all ages' category among the males and uniformly for all age groups among the females, compared to expressing it as proportion of manpower remaining unemployed and seeking job.

(2) *Incidence of Unemployment:*

In Tables 3 and 4, the incidence of unemployment is presented according to different subjects, educational qualifications, division obtained and sex for various ages in order to study their inter-relationships. A few points may be highlighted:

(a) Age and Unemployment: The incidence of unemployment is concentrated in the younger age groups, below 30 years for the educational categories.[17] If the incidence of unemployment is distributed over different ages, 89.6 per cent of the males and 86.1 per cent of the females having MSc (Science) degree, 95.3 per cent of the males with MSc (Agriculture) degree, 81.3 per cent of the males with BE degree, 82.1 per cent with ME degree, and 91.1 per cent of the females with MBBS degree fall below 30 years of age, whereas 95.9 per cent of unemployed with MBBS degree fall below 34 years of age.

The high incidence of unemployment among the younger age group is generally attributed (i) to a gap between demand for and supply of labour resulting in the unemployment of the young because they are new entrants to the labour market without prior experience;[18] and/or (ii) to the 'waiting period phenomena'. That is one has to search for a long period before one finds a job in the labour market and longer the search, better are the chances of finding a suitable job.[19]

Unfortunately from the present sample, it is not possible to say if this group is in search of their first job. Nevertheless, that they have certainly to search for a period in the labour market, is borne out from the data. The discussion on the duration of unemployment is left for the next sections.

(b) Academic Performance and Unemployment: The division the incumbents have obtained in their highest educational qualification is considered here as an index of their academic performance. (Incumbents with Ph D would be an exception to this as no division is given for the award of this degree.) The incidence of unemployment is found to vary with division obtained for all educational qualifications. Particularly the incidence of unemployment, ie, more among the second divisioners than the first or third divisioners for males, the two exceptions from this being the males with ME degree and females with MSc (Science) and MBBS degrees. In the case of ME (Males), second divisioners face less unemployment compared to first and third divisioners, while for females with either MSc (Science) or MBBS degree, second divisioners face less unemployment compared to the third divisioners but more than first divisioners.

The rise in the incidence of unemployment from the first division progressively to the third division is in line with the general expectation. However, the unusually high incidence of unemployment amongst second divisioners compared to the first and even third divisioners calls for an explanation. It is possible that the second divisioners may continue their job search for a longer time to ultimately find a suitable job; such an option although available for the third divisioners may not be fruitful as they are unlikely to receive the same starting salary of the first divisioners, and in view of this they are generally forced to lower their reservation price (the price at which they offer themselves),[20] and where second divisioners face less unemployment compared to the first and third divisioners it could be that this group would have lowered its reservation price compared to the first divisioners which further reduced the chances of employment for the third divisioners.

(c) Sex and duration of unemployment: In general it is found that the incidence of unemployment is consistently higher for females than males for all educational qualifications.

(d) Education and unemployment: Considering all educational qualifications, the incidence of unemployment for the males is the least among MBBS and ME degree holders and highest among BE degree holders, with MSc (Sc and Agrl) falling in between. If the incidence of unemployment is treated as an index for ranking any educational qualification in the

present study, MBSS would take the first position for both sexes, as their incidence of unemployment is the lowest and BE amongst the males and MSc (Sc) amongst the females would rank the last.

(3) *Duration of Unemployment:*

Tables 5 and 6 furnish details regarding the duration of unemployment in mean months according to educational qualification, division obtained and age for males and females separately. A few points are noteworthy:

(a) Age and Duration of unemployment: The duration of unemployment is found to increase with age for both the sexes and all educational qualifications. Irrespective of academic performance, it is seen that as age increases the duration of unemployment also increases. This may be so because the transition between jobs is more difficult for aged professionals with higher qualifications who usually have higher earnings compared to these with less educational qualifications. Besides, a prolonged spell of unemployment at the older age may also be partly voluntary in the sense that it reflects a long job search.[11]

(b) Academic Performance and duration of unemployment: Academic performance in the highest degree examination passed by the incumbent is found to have a powerful influence on the duration of unemployment. Considering academic performance, as in the previous section, in terms of division obtained in the highest examination, it is found that among the males with the exception of MSc (Science) degree holders, the duration of unemployment is longer for the second divisioners than the first divisioners (for all educational qualifications). However, among females with MSc (Science) degree, second divisioners face a longer duration of unemployment compared to the first divisioners, particularly in the younger age groups.

(c) Sex and Duration of Unemployment: The duration of unemployment among females exceeds that of males for all ages. This found to be true for all educational qualifications.

(d) Education and Duration of Unemployment: Table 5 reveals an inverse relationship between educational qualification and duration of unemployment: higher the educational qualification lesser the duration of unemployment. Among the educational qualifications here, the duration of unemployment is lowest for MD degree holders and highest among persons with MSc (Science) degree. Further, the duration of unemployment is more among BE's than MSc (Agriculture) degree holders.

III

The preceeding tabulations bring out clearly that, on the average, persons with professional qualifications do face unemployment for some period — although, being a male, having a master's degree, a first division, etc — affect the duration of job search. Nevertheless, there occurs a considerable variance in the duration of unemployment amongst these professionals. The present section examines this variance using regression techniques in order to determine who among the unemployed average a minimum period of job search and who a maximum job search period and also the statistical significance of the factors associated with the job search.

The determinants of the duration of unemployment are examined by means of an unemployment function using multiple regression analysis in which the duration of unemployment is the dependent variable and the explanatory variables are the various characteristics of the unemployed persons, such as education, sex, and academic performance as measured by division obtained.

Symbolically, the function is as follows:

$$D = a_0 + \sum_{r=1}^{\alpha} a_i = Ed_i + b \text{ sex } +$$

c division + e where D is the duration of unemployment in months.

In the above regression model, the duration of unemployment at the time of the survey (March 1971) is related to set of explanatory variables which take the value of either 1 (where observed or 0 where not observed). By breaking up the independent variables into discrete categories, allowance has been made for non-linear effects. There exists also an error term 'e' that reflects the effect of all other variables that affect the duration of unemployment but ones not included in the model.

There are 10 educational qualifications included here. They are: (1) PhD (Science) (2) MSc, (3) MSc (Agriculture), (4) MBBS, (5) MS/MD, (6) MVSc, (7) PhD (veterinary), (8) BE, (9) ME, and (10) PhD (Engineering) In the available literature education is usually measured by the number of years of schooling completed and as such it is continuous variable.[12] In this study, it is measured as a dummy, because the sample contains categories of education with very little variation in years of schooling and, the dummies help understand the effect of different kinds of education on the duration of unemployment.

Division refers to division on the highest educational qualification. For measurement the smaple has been split in to two groups: (1) First Division and (II) Second Division and others.

Results

Table 7 presents the regression results for the duration of unemployment. In Table 8 are presented the expected duration of unemployment (in months) for the both sexes according to different educational qualifications and division obtained as estimated from the regression co-efficients.

(i) Education and Unemployment: For both sexes, the duration of unemployment is lowest among doctors with MBBS degree (9.07 months) and highest for persons with MSc (Sc) degree (16.54 months).[13] In consequence MBBS can be considered as more popular educational qualification and MSc (Science) as less popular.

Table 8 as a whole shows that the expected duration of unemployment is shortest for the MVSc degree holders and longest for those with PhD (Science).

Further, while the average years of schooling remains the same, [for example between BE, Msc (Science) and MSc (Agriculture) and among PhD's] the duration of unemployment is found to vary significantly among these educational qualifications.

(ii) Academic Performance, Sex and Unemployment: The duration of unemployment appears to be lesser among those with higher academic performance, i e, among the first divisioners than among those with other divisions or lower academic performances. This pattern is similar among both the sexes.

Also, for any particular educational qualification and divisions obtained, the duration of unemployment is longer among the females compared to the males. It must, however, be mentioned here that among the females, other than in MSc (Science) degree, the present sample contains less number of observations about those with other educational qualification who have reported their actual duration of unemployment.

Conclusion :

The unemployment of highly professional qualified manpower has been described both in terms of its incidence and its duration. The factors associated with the duration of unemployment have been analysed. The empirical findings suggest the following: First, given a comparable length of exposure to education, the duration of unemployment is found to vary significantly among the different categories of professional manpower (*viz*, Scientists, Engineers, Doctors and Agricultural and Veterinary Scientists); second, in each category, the duration of unemployment is less among those with higher academic performance than among those with lower academic performance, and lastly, the females face a longer duration of unemployment compared to the males.

Although some information has been provided regarding unemployment among highly educated manpower, much more needs to be learned. A number of questions usually asked about the unemployed, however, remain unanswered here. For instance, given the personal characteristics, the likely role of the family background of the incumbents in determining the incidence and the duration of unemployment needs adequate consideration. Similarly, it would be worthwhile analysing the salary differentials between those who accept employment without a long search and those who do so after a long search. If those who accept early offers are from poor families and earn less, then it has serious implications for the role of education in determining income inequality. Besides, how education influences the job expectations of the unemployed and the role of these expectations in determining their employment success, and how the unemployed receive and utilise information about the job market require adequate attention of the researcher. Lastly, there may be many variables other than those used in the present study which might serve largely to explain the additional variance in the duration of unemployment.

Obviously, the answers to these and many other questions demand much further research.

Notes

[The author is most grateful to A M Nalla Gounden for his unstinting guidance and criticism in the preparation of this paper. I owe much to Tapas Majumdar, M S Ramanujam and especially D N Rao for their valuable suggestions and encouragement. 15 Census of India 1971, *op cit*, p ix.

16 There is another category of persons in the sample who have reported as 'unemployed not seeking job'. This category is left out of analysis because it is voluntary unemployment. This category forms a very small percentage among males and the proportion among females is slightly higher. For details see Tables 1 and 2.

17 It must be mentioned that the unemployment noticed among the

35-44 age group in Tables 3 and 4 and also 5 and 6 would have further reduced if we had a larger sample with more incumbents reporting their employment/unemployment status. Besides, considering the 60-65 and above age group where a majority would have retired from the labour market, the incidence of unemployment is perhaps only likely among those who consider themselves as unemployed and not as retired.

23 In the present sample the number of respondents with degree MS/MD, MVSc, ME and PhD (all subjects) reports as unemployed seeking job are much smaller-compared to qualifications MBBS, BE, MSc (Science and Agriculture) where the number of respondents are much larger.

Agrarian Relations in a Khasi State

Bani Prasanna Misra

The office of the Syiem *among the Khasi people, even though now considerably shorn of its previous glories, is nevertheless of considerable importance and potential gain to the holder. It is not accidental that the person aiming for the office has to belong to one or other of a few select clans, and the members of the 'electoral college' which elects the* Syiem *comprise mostly of Khasi nobility.*

This account of agrarian relations in a Khasi 'state' begins with a brief account of the administrative system of the Khasis and then goes on to detail the system of land tenure prevalent in the Syiemship of the territory of Maharam in the Khasi Hills. A careful scrutiny of the finer nuances and the actual working of the system of land tenure in Maharam reveals that a very large area of even 'common land', of which the Syiem *is supposed to be only the custodian, is managed by the* Syiem *in virtually the same manner in which he and his clansmen manage* Ri Kynti, *land which is in exclusive possession of the* Syiem.

The increasing destitution of the Khasi poor cannot be laid (as it is often done) at the door of the traditional law of female untimogeniture, for an archaic matrilineal inheritance could never have survived if it had gone against Khasi nobility; instead, the roots of such destitution are inherent in the traditions, laws and practices that govern the control and ownership of land.

The Syiem ruler will overseer the market places and will fine and imprison the wrongdoers; but no one will pay him any land tax, because all the land — the *ri raj* and *ri kynti* —belong to them, the people of the land.

U Soso Tham

THE territory of Maharam in the Khasi hills constituted one of the Khasi states before the commencement of the Constitution of independent India. It lies to the west of Cherra-Mawsynram region which is the highest rainfall area of the world. The Hima (state) Maharam extends upto the border of Bangladesh to the south; Mawqyrwat, Mawten, Rangthong and Balat are some of its important villages.

Since no areas of Khasi hills have till now been cadastrally surveyed the extent of Hima Maharam is not known for certain. Further it has generally been held that the Khasi Chiefs are not territorial sovereigns but Chiefs whose authority is over their subjects. The territorial limits of a Hima therefore cannot be ascertained with precision. But since in practice the effective jurisdiction of a Chief extends over some villages the boundaries of such localities may be held to constitute the confines of their respective rule. In accordance with this it appears, from a rough calculation, that the area of Hima Maharam will not be less than six to seven hundred square kilometres.

Not much is known about the early history of Maharam excepting that at one time it was ruled by two Lyngdohs (priestly clan). The jait syiem (ruling clan) arrived afterwards from elsewhere in Khasi hills[1] and they were invested with the responsibilities of administration. A Syiem was always selected from among the members of the jait syiem according to the rules of succession by an electoral college consisting of the *bakhraw-batri* (noblemen) and some other village headmen.[2] The rules of succession are not very clear and specific and hence there has always been a scope of interpreting them differently by the various members of the electoral college depending upon their individual convenience.

In Hima Maharam the situation is slightly more confusing because the ruling Syiem clan has two branches there — Syiemlieh (white Syiem) and Syiemlong (black Syiem) — and either of them can provide a ruler for the state. But the fact that the ruler must belong to the *jait syiem* and the electoral college primarily consists of the *bakhraw-batri* makes the scope of Khasi democracy very limited. The *bakhraws* are defined to be members of the hereditary nobility of Hima Maharam and they belong to only two jaits — Lyngdoh and Sanglein. The Hima Maharam, which in the pre-historical period was administered by two Lyngdohs and which subsequently had a Syiem of its own, has seven *bakhraws* from among the Lyngdohs at present. They are: (1) Lyngdoh Sakwang, (2) Lyngdoh Nonglwai, (3) Lyngdoh Nongkhlaw, (4) Lyngdoh Nongsynrih; (5) Lyngdoh Nonglyngkien, (6) Lyngdoh Nonglang and (7) Lyngdoh Marshillong.[3]

The concept of jait, in the context of the matrilineal society of the Khasis, means a clan or a collection of families bearing often the same surname and tracing their descent from the same ancestress. Since only the male members of the society are entrusted with the tasks of administration of the country, the *Syiem*, *Lyngdoh* and the *Sanglein* referred here are all males. But

Authority	Type of Land	
	Forest	Others
Syiem	Ri Sylem (UH)	Ri Bam Syiem (UH); Ri Iapduh (UH)
Lyngdoh Clans(s)	Ri Law Lyngdoh (UH) Ri Law Sumar (UHTO)	Ri Lyngdoh (UH) Ri Kur (UHTO); Ri Khain (UHTO); Ri Duwar (UHTO)
Individual	Ri Law Sumar (UHTO)	Ri Nongtymen (UHTO); Ri Khorid (UHTO); Ri Dakhol (UHTOO); Ri Spah (UHTL); Ri Longdung (UL)
Community	Ri Law Shnong (U); Ri Law Kyntang (U)	Ri Raid (U)
Prohibited land	Ri Law Sang Ri Law Adong;	—
No-man's-land	——	Ri Pud

Note : Nature of rights-U-Usufructuary; H-Heritable; T-Transferable; O-Ownership; L-Leasehold. Individual lands may belong to either an individual family (iing) or an individual sub-clan (*kpoh*).

the point should not be lost sight of that the Syiem is a Syiem because he is born of a Syiem mother. The same is the case with the Lyngdoh and Sanglein.

After the political integration of the Khasi states with India during the British period the office of Syiem lost some of its previous glories. In the post-Independence period, the District Councils formed under the Sixth Schedule of the Constitution and the governmental machinery at the state level that came into being after the state of Meghalaya was inaugurated in 1972 have taken upon them some powers that were exercised in the past by the Syiem with the aid of the local self-governing institutions operating under his overall jurisdiction. But despite these changes the office of Syiem is important even now and the Syiems continue to weild considerable influence over their subjects.

The Syiemship is recognised by the government of India and the appointment and succession of Syiems is supervised by the District Council. The Syiem's Court is recognised as an additional District Council Court. The village headmen receive *sanads* from their respective Siems. The administration over matters relating to land and agrarian relations is looked after by the Syiem. Market imposts, rental of lime quaries. forest revenue and judicial fines constitute important sources of earnings of Hima Maharam. There appears to be no separation of the public and private purse of the Syiem, and the Syiem enjoys the benefits of this collection in association with his chief aides — the bakhraws and other wealthy people. This happens because the Syiem is supported at the time of election by interested parties, who provide the heavy expense of entertainment or of buying votes. The Syiem thus takes office under obligation to his relatives or to others who have lent him money during election.

Administrative System

There are three traditional administrative agencies within Hima Maharam. At the lowest level is the *Dorbar* or the village council. The head of the village council is generally designated the Myntri or Sordar. The other councillors of the same are the *Rangbah Shnongs* or adult males from among the *bakhraws* of the village. Sometimes such appointments are made on considerations of wealth instead of tradition and noble descent. The new avenues of accumulation of wealth that have been opened by the expansion of secondary and tertiary sectors of the economy have gradually created a class of neo-*bakhraws* and this latter class sometimes tend to compete with the traditional nobility.

The second tier of administration in Maharam is the *Dorbar Hima* (state council) which is the biggest assembly and its members are the village headmen and the representatives from among certain clans. The Dorbar Hima is convened on special occasions including the death and appointment of Syiems. The Syiem may from time to time ask the Secretary of the Dorbar or the Myntri-in-charge to convene the council if necessary.

Finally there is the *Dorbar Syiem* or the Syiem's Council which is a separate Dorbar consisting of the Syiem and some of the more important *bakhraws*. For obvious reasons of all jaits the Lyngdoh and Sanglein only are represented in the Dorbar Syiem. The representative from jait Lyngdoh is known as Lyngdoh and that from jait [illegible] head [illegible] is the seniormost settler on land. The Syiem in co-operation with the Lyngdoh and Basan manages the affairs of the state including land administration. They also look after finance, court-cases, appointment of officers to carry out specific tasks, the enforcement of law and order and also the instructions received from time to time from the government.[5]

In fact on the basis of seniority of occupation and sometimes that of military prowess the population in a Khasi state can be divided into the following categories: Those families who are the founders of villages and hence the earliest occupants of soil are categorised as the Ki Khun Nyngkong or literallly the first children or rather the first group of citizens. The Basans therefore, by definition, belong to the category of *Ki Khun Nyngkong*. In a similar fashion the second and third group of citizens are differentiated as the *Ki Khun Pdeng* and *Ki Khun Khadduh* respectively. These groups pay no land tax or any kind of tax whatever and are usually co-partners with the Syiem in running the administration. The Khasi state thus becomes an estate, *inter se*, of the landlords of the above varieties.

The later Khasi immigrants into the state are distinguished as *Khun soh Syiem* and *Khun Shnat*. They are bound to recognise the state by paying *ka bairung* (entry fee) and *ka pynshok* (protection fee). The original groups of citizens may lease out land to them on condition of payment of *Khajna* or may absorb them as labourers for field work either on wage payment in which case they will be known as *ki nongbylla* or by providing them with board and lodging in which case they become *ap jakpoh* or some sort of attached labourers for the landlords.

To sum up: the whole Khasi society may broadly be classified into the following two categories: (1) the Bakhraw-batri or the noblemen on the one side and the (2) Paidbah-paidkar or the lay masses on the other. The seniority in settlement and the matrilineal descent become the determining factor in obtaining a higher status in society and to a certain extent, therefore, the individual volition gets circumscribed. This stratification is of immense significance in the context of Khasi society and a traditional maxim towards good conduct on the part of children has been put in a famous poem at the beginning of this century as follows:[6]

> Respect and obey the nobles, headmen and the Syiem; thereby the virtue and happiness of your land will be enhanced. Oh Syiem, Oh bakhraw-batri, kindly take care of your

Table 2: Population and Labour in Ri Khain Nonglang Maharam

children, the people, day and night; protect the hills and dales, and lead your people through ease and difficulties.

The solidarity and stability of the Khasi society owes much to such an ideology and indoctrination.

Land Tenure and Agrarian Relations

This broad social stratification cannot be overlooked while we try to understand the type of land tenure and agrarian relations that prevail in the Khasi hills. For long it has been known that the land in Khasi hills can generally be classified into the following two categories — *ri kynti* or private land and *ri raid* or communal land. It is significant that in the perception of the people themselves, *ri kynti* is a type of self-acquired property of only those that are connected with the jait Syiem and perpetuated with the aid of State power.

Those having an intimate knowledge of the traditional system of land tenure among the Khasis are of the opinion that the jait bakhraws were the first to create a *ri kynti* for themselves. The undivided *ri raid* remained for the general use of the commoners. The *ri kyntis* and the undivided land which come under the control of the *bakhraws* are called *Ka it ka Hima*. The word *Ka it* means the border, extent; *Ka Hima* means the State. Thus the phrase *Ka it ka Hima* means the State with its border and extent.

"In the undivided land within *Ka it ka Hima* there are houses and villages which need land for cultivation and other purposes. For these houses and villages, lands are therefore reserved for their needs as common lands. These are called *raid* lands... These villages pay contribution and render help to *Ka it ka Hima* of the *bakhraws* when needed."[7] With increase in population, improvement in transport facilities and growing demand for cash crops, there has been a marked tendency for persons to occupy and claim as much *raid* land as they can. People possessing ready cash are apt to enclose big areas in a *raid* land to the exclusion of everybody else in the village. The traditional social system has been conducive to allow the bakhraws the much-needed primitive accumulation. The customary land tenure recognises the permanent and heritable right of a person over *raid* land if it is not kept fallow forthree years at a stretch. Thus the *bakhraws* having the necessary capital and legal sanction acquire as much private land as they think can be profitably cultivated. It has been noted that there are instances where even mud or stone walls are erected right round the areas, and instead of ordinary cultivation, pine trees are grown, and the areas with the trees kept as their private reserves and regarded as in their absolute possession, with a right to cultivate there and sell the trees therefrom and then grow trees again as in *Ri Kyntis*.[8] In many places the valley lands have all been enclosed as the *ri kynti* of private owners, and *ri- raid* is identified with hills and barren wastes.[9]

Finer Nuances of Tenure

The division of lands into *ri kynti* and *ri raid* is good for the purposes of a first approximation but much of the finer nuances of land tenure in Khasi hills are lost if one refuses to go beyond it. From a careful scrutiny of all available records in Table 1 has been prepared to show the different types of land according to authority and tenure in Hima Maharam. Ri means land, and Ri Syiem indicates land set apart for the use of the Syiem ruler. *Ri bam Syiem* is the crown land where crops are grown for the maintenance and benefit of the Syiem family. *Ri lapduh* is the privately owned land of a clan or family that has become extinct. Such lands according to the time-honoured custom escheats to the Syiem who is regarded to be immune from any curse on that family.

Khlaw or *'Law* means forest. *Ri Law Lyngdoh* is forest land managed by the Lyngdoh priest for the sake of religious rites and rituals of villagers. *Ri Lyngdoh* is his service land kept apart for his maintenance and upkeep. *Ri Law Sumar* is land afforested by private person(s) and hence private property. *Ri Kur, Ri Khain* and *Ri Duwar* are clan lands. Of these, *Ri Duwar* is usually situated on way to market places, river ghats or the like giving their owners the opportunity to collect tolls from people.

Ri Nongtymmen is ancestral property obtained through inheritance. *Ri Khorid* is land acquired and purchased by oneself. *Ri Dakhol* is private land by virtue of continued occupation and possession. *Ri Spah* is land held on lease over which the lessee has use, heritable and transferable rights for as long as he pays rent to the landlords. *Ri Longdung* is also leasehold land which however cannot be transferred by the lessee to any other without the permission of the landlords.

Ri Law Shnong is reserved as village forest for supplying firewood, building material, etc, to the villagers. *Ri Law Kyntang* is village forest reserved for religious uses. *Ri Raid* is common land where cultivation can be undertaken by any commoner after obtaining due permission from the Dorbar; cultivation is undertaken individually on plots assigned by the appropriate Dorbar and hence the existence of common land should not be confused with any variety of primitive communism. *Ri Law Adong* is prohibited forest maintained as water catchment areas or for such other ecological reasons. *Ri Law Sang* is however an absolutely tabooed forest and never put under any uses, for, it is commonly believed that the use of or encroachment upon such land will bring misfortune to the person concerned. *Ri Pud* is no-man's-land because it is left as a buffer to differentiate the boundaries of two adjacent landed properties.

Ri Kynti proper will therefore include *Ri Law Sumar, Ri Kur, Ri Khain, Ri Duwar, Ri Nongtymmen, Ri Khorid*

and [illegible] has [illegible] and [illegible] rights over them. Community land, strictly speaking, will include *Ri Law Shnong, Ri Law Kyntang* and *Ri Raid* only. Attempts are however made sometimes by interested persons to give an inflated picture of community land by including within its ambit prohibited land like *Ri Law Adong* and *Ri Law Sang*. The inclusion of prohibited land, barren land or buffer land within the so-called *Ri Raid* is misleading and does not meet the growing demands for social justice.

Ownership and Control

In Hima Maharam there are numerous *Ri Nongtymmen* and *Ri Khorid*, 17 *Ri Khain* and only four *Ri Raid* lands. The area under individual *Ri Kynti* is not known. But according to one estimate, *Ri Khain* and other clan lands form about 33 per cent of total territory while the *Ri Raid* will be about 10 per cent.[10]

The Jaits or clans who own *Ri Khain* or *Ri Kur* in Hima Maharam are the following : (1) Syiem, (2) Lyngdoh, (3) Sanglem, (4) Lyngkhoi, (5) Ryja Mongrem, (6) Thongni, (7) Tongwah, (8) Wanniang, (9) Jyrwa, (10) Kharjahrin, (11) Ramsiej, (12) Mawlein, (13) Marngar, (14) Nongsiej, (15) Nonglam, (16) Snaitang, (17) Shangdiar (18) Shylla.

The Syiem, ruler of Hima Maharam has authority over *Ri Syiem, Ri Bam Syiem* and *Ri Iapduh*, as has been mentioned earlier. But the Syiems as a Jait have their clan land also. The *Ri Khain* called *Ri Dewsaw* within Hima Maharam is the property of the Syiem clan. The land is leased out to people for purposes of cultivation on various terms and conditions. Similarly the Jait Snaitang has its clan land called *Khain Raibah*. So also with the other clans mentioned above.

Sometimes the clan lands are owned and managed by more than one clan together. The '*Ri Khain Nonglang* and Mawkyrwat bazar' in Hima Maharam is one such example. It has been for long a joint property of the following five jaits: Shangdiarbah, Shangdiarnah, Shylla, Lyngdoh and Wanniang. However since the Wanniangs have sold away their rights to the remaining four jaits, it is now a *Ri Khain* of Shangdiarbah, Shangdiarnah, Shylla and Lyngdohs. It is a huge land area of about 100 square miles and about one fourth of the whole of Hima Maharam is contained within it. There are 17 villages within *Ri Khain Nonglang*. 115 *mawpud*s (Boundary marks made of stones) have been implanted at various places to demarcate the total territory. According to traditional accounts it ap[illegible] been acquired [illegible] by [illegible]. There have been other [illegible] tenders and many inter-jait and inter-village feuds took place over the possession of the territory.'

A committee of four representatives, one from each Jait, manages the administrative affairs of *Ri Khain Nonglang*. Traditionally, the representative of Jait Shagdiarbah is the ex officio 'Manager' of the Committee. The managing committee (*Ka Seng*) is responsible for the management of land, including leasing out of Mawkyrwat bazar, maintaining registers and accounts regarding land leased out for cultivation of potatoes, paddy, horticulture, fisheries, building of houses or shops, claiming compensation from the government for construction of offices and roads, afforestation, keeping provision for village graveyards, church and playground. The managing committee also undertakes to maintain law and order and settle land disputes. No individual lease holder is allowed to put any boundary stones by himself. The leaseholders hold land as *Ri Spah* or *Ri Longdung* as the case may be. They do not have any right whatsoever in the administration of the territory and are not entitled to send any of their representative to the managing committee. Their rights are limited to obtaining their shares from the produce of the land according to the terms agreed upon (see Appendix 'A' for an understanding of the type of terms and conditions that are usually put forward in a lease of clan lands).

The ownership, management and control of land being such as has been described above, it is possible that a large number of tenants and agricultural labourers are there among the agricultural population. The number of tenants cannot be ascertained from any of the published documents and the census definition of agricultural labourers is also inadequate for this purpose. Table 2 presents a breakdown of cultivators and agricultural labourers as obtained from the census data for some of the villages within *Ri Khain Nonglang*.

The law of female ultimogeniture prevailing in Khasi hills has sometimes been held responsible for facilitating the creation of a class of dispossessed citizens. But an archaic matrilineal inheritance could not have survived if it went against the *Bakhraws* or failed to attain some sort of an equilibrium for a long period. The existence of *Ri kynti, Ri kur* or *Ri khain* and the type of organisation evolved for their maintenance creates a ready demand for tenants and labourers, and thus the [illegible] by *Ri raid*, [illegible] even though composed mostly of hill wastes and forming barely 10 per cent of the total land mass, have the characteristics of a built-in safety valve. But, it appears, it will not be able to sustain for long. One reason is that in many places including Hima Maharam the Syiem is the custodian of *Ri Raid* lands for and on behalf of the people. The Syiem in company with the *Bakhraws* is a sort of manager for *Ri Raid*, and as such he leases out the land for cultivation, house-sites, livestock and poultry farming, etc. He may punish or expel people from the *Ri raid* if he considers that they are undermining his authority. Gradually, therefore, the Syiem may grab a part of *Ri raid* and use it, for all intents and purposes, as his private land. According to one report the areas of Ranikor-Langshnong-Munai-Balat in Hima Maharam have already been made the *Ri kynti* of Jait Syiem through the above process (see Appendix 'B' for a copy of the lease form issued by the Syiem on land situated within *raid* land of Balat and Ranikor).

Appendix : A

This land __________ leased out for cultivation in lawmyriaw is the *ri kynti* of three clans (1) Kharthongal Ryja, (2) Bangto and (3) Pallar, and situated in Nonglah within Hima Maharam.

We, the main representatives and administrators of the three clans who are the owners of the '*Ri Kur Ri Kynti Lawmyriaw*' in Nongnah within Hima Maharam, give this in writing to you U/Ka __________ of ______ so that you may know that we have leased out for cultivation of ______ crops in the plot named ______ about ______ by ______ in area within the *ri kur ri kynti* of our three clans, and that this portion of the land so leased out has been shown to you. You will cultivate this land according to the terms and conditions as given below:—

(1) This lease will be valid for one crop season only.
(2) You will not cultivate more land than what is given to you.
(3) You will pay without fail during harvest the rent upon this land at the rate of one-fifth of the produce or according to the changes made from time to time.
(4) If you cut the forest and do not sow without any valid reasons then you must pay compensation for the damage to forest caused by you.
(5) You are not allowed to sublet the land without first obtaining the permission from us the landlords.
(6) If you do not take due care and abandon this land it will be taken back from you.
(7) You are not permitted to put fire in this land.
(8) You are not allowed to construct houses excepting field-sheds.

[illegible] terms and conditions.

Signatures

Dated Domsohkhai
the ———— 19 .
on behalf of the three clans of Nongnah
I U/Ka ———— of ————
take this plot of land on lease for cultivating ———— from you, the landlords, according to the terms and conditions above. I promise to obey all these and if I violate any you, the landlords, will take back the land immediately from me.
Dated Domsohkhai
the ———— 19
Signature of lessee ————

APPENDIX : B

From the Office of the Syiem of Maharam

Patta No ———— of 1968————
Dated Mawkyrwat, the ———— 1968
To
U/Ka ————————
Village ———— Maharam Syiemship.

This lease (*patta*) is given to you by me so that you may cultivate the paddy field in the area called ———— within Raid Balat and Ranigor, the dimension of the land being———— *Kiar*, as per the boundaries shown below: —

North — East — South — West ——

You will observe the following terms and conditions:—

(1) You must renew this *patta* and pay duly the lease money (*bai patta*) before 31st March of every year.
(2) That you will not sell, mortgage or transfer the land in any manner without the knowledge and sanction of the Syiem.
(3) That you will have no claim upon this land given on lease to you if you leave Hima Maharam or give up possession for three years or if you do not pay regularly the *khajna* (bai khajna).
(4) If you violate any of the conditions of this *patta* the Syiem will forfeit away your rights.

Signed

Syiem of Maharam Syiemship

I agree to abide by the terms and conditions made above in full faith and knowledge without being compelled by any one.

Masterpieces inspired by Indian Dyes

KALAMKARI

KALAMKARI is an exquisite art of painting on cloth with the use of vegetable dyes. This art flourished in South India around the 14 century A.D

Derived from 'Kalam' (pen) and Kari' (art) it is a superb style of fine line painting based on themes taken from Indian mythology

The colours reflect the variegated hues of temple interiors and bear elegant witness to the skill with which Indian artisans used their limited range of natural dyes.

Indian dyes have come a long way since then.

At Atul Products we produce a wide range of Synthetic Dyes which help colour everything from fabrics of cotton jute, wool art-silk, and man made fibre, to leather and paper

Atul also produces Dye Intermediates to help make Synthetic Dyes and Optical Whitening Agents which make whites look whiter.

Every Atul Product is a masterpiece painstakingly blended and like the ancient undying hues of Kalamkari—rich, vivid and universally appealing.

Wherever there is colour, there is a dye. Atul makes some of the finest man-made dyes.

SMALL FARMER DEVELOPMENT

FALL OF IDI AMIN

REVIEW OF MANAGEMENT

…ow MSFC can … all-scale industr… the world map.

Being a small-scale entrepreneur gives you greater competitive strength because of lower overheads. All it needs to get a foothold in the world and Indian markets is upgrading technology. And, modernisation of plant and machinery.

MSFC is willing to help you with foreign exchange loans. You can import plant and machinery under a World Bank Line of Credit extent by IDBI.

World Bank Loan Scheme extended!

Fortunately, this facility has now been extended upto 30th June, 1980. So don't delay. The sooner you make your application, the sooner we can help you in your business.

Attractive terms

You get foreign exchange loans on attractive terms. You pay only 11½% if yours is a small-scale unit covered under the Credit Guarantee Scheme, or a unit assisted under the Technicians Assistance Scheme or a unit located in the specified backward areas. For others also, the rate of interest is attractive. Just 12%. For the rupee component part of the World Bank Loan, the rate in backward districts is only 8½% and 11% to 12½%, with refinance, in the rest of the areas.

Even the repayment is [illegible] 10 years normally, with 2-year [illegible] torium.

Our business

In addition to foreign exchange, we meet the term loan needs, mainly of small-scale and medium-scale industries for acquiring fixed assets.

In fact, 84% of the units we have assisted so far belong to small-scale entrepreneurs.

We also have special loan schemes for the educated unemployed, the technically experienced and the academically qualified entrepreneurs to get self-employed. Or, to start their own ventures. Under these schemes, loans are made available on attractive terms of margin, interest and repayment period.

We assist every viable project. Our loans range from as little as Rs. 5000 to Rs. 30 lakhs, without any constraint on our funds.

If you need any specific information, please write to our Public Relations Department. Or, ask for an informative booklet "MSFC answers your questions".

... Debt

DESPITE the plethora of schemes and programmes supposedly intended to ameliorate the condition of the poor, the plight of rural labour has steadily worsened. The government's own periodical enquiries into the condition of agricultural and rural labourers bear this out.

The Rural Labour Enquiry of 1974-75, fourth in the series, marks many improvements over the preceding three such enquiries—the first and second Agricultural Labour Enquiries of 1950-51 and 1956-57, respectively, and the Rural Labour Enquiry conducted in two phases in 1963-65. These surveys have unravelled different dimensions of the poverty among agricultural (and all rural) labour households: the extent of employment among male and female labourers, their earnings, the nature of occupations, indebtedness, sources of debt, purposes of debt, etc. The 1974-75 Enquiry has covered three further aspects: (i) extent of awareness among agricultural labourers regarding the Minimum Wages and its provisions; (ii) extent of trade union organisation among agricultural labourers; and (iii) educational levels among rural labour households. A Summary Report setting out some of the major findings of the Enquiry was released by the Labour Review last year (*EPW*, August 17, 1978). Now the Bureau has released the first of four independent reports which it proposes to publish. This one is on indebtedness among rural labour households. The other three reports will deal with (i) wages and salaries; (ii) employment and unemployment; and (iii) household income and expenditure.

The report on indebtedness presents information separately for scheduled caste and scheduled tribe households among agricultural labour households and all rural labour households. The Report also presents data on (i) the nature of debt (whether hereditary or contracted and, in the latter case, whether in cash or kind or both); (ii) purposes of debt (whether for household consumption, ceremonial purposes, productive uses, etc); and (iii) sources of debt (whether moneylenders, shopkeepers, employers, co-operative societies, banks, etc). Data on all these aspects are presented separately for (a) households with land and those without land; (b) different states and zones; (c) households of different sizes; and (d) households classified by amount of debt. Finally, the findings of the 1974-75 Enquiry have been compared with those of the 1964-65 Enquiry.

While the total number of all rural households increased by 11.7 million, or by 16.6 per cent, from 70.4 million to 82.1 million between 1964-65 and 1974-75, the number of rural labour households increased by 7 million, or by as much as 39 per cent. Thus, of the total increase in the number of rural households, about 60 per cent was of labour households. The number of agricultural labour households increased by 36 per cent, or by 5.4 million. In other words, about 46 per cent of the increase in total rural households and 77 per cent of the increase in rural labour households were accounted for by agricultural labour households. The processes by which the rise in the number of labour households has taken place is as significant as the fact of the rise itself. The Labour Enquiry understandably cannot throw light on the dispossession of small and marginal farmers of their land, but it does bring out the fact of a progressively larger number of small and marginal farmers swelling the ranks of agricultural labour households. Thus the *proportion* of agricultural labour households *with land* has gone up from 43.9 per cent in 1964-65 to 49.2 per cent in 1974-75. It is this growing pauperisation of rural and farm labour households which provides the backdrop to the Rural Labour Enquiry's findings on the incidence of indebtedness among these households.

Debt is defined by the Rural Labour Enquiry to include borrowings in cash and kind, credit purchases, and advance payment received for forward delivery of goods. The proportion of farm labour households which were indebted had gone up from 60.6 per cent in 1964-65 to 66.4 per cent in 1974-75. State-wise, the incidence of indebtedness was more than 70 per cent in Bihar, Rajasthan, Punjab, Haryana, Andhra Pradesh, Tamil Nadu and Kerala. It is noteworthy that the increase of indebtedness among rural labour households in 1974-75 was the heaviest in the two agriculturally most prosperous states of Haryana (80 per cent) and Punjab (75 per cent). It is noteworthy, however, that institutional credit from co-operatives or banks to labour households in these states was not higher nor was their dependence on non-institutional sources of credit any the less than of households in other states.

Secondly, the incidence of indebtedness was higher among the rural labour households *with land* than those without land. At the all-India level, the proportions for the two types of households were 71 per cent and 62 per cent, respectively. The share of institutional agencies in the total debt of labour households was negligible. This is apparently explained by the fact that money-

lenders and landlords are more willing to give credit to those who possess some land, however small, than to the landless.

Thirdly, scheduled caste labour households had the highest incidence of debt, i e, 71 per cent in 1974-75; and the proportion had gone up from 66 per cent in 1964-65. The corresponding proportion for scheduled tribe households was 50 per cent in 1974-75 and 47 per cent in 1964-65.

The average debt per indebted rural labour household rose from Rs 244 in 1964-65 to Rs 584 in 1974-75. The northern zone had the highest figure of average debt in both 1964-65 and 1974-75. In Rajasthan, the average debt was Rs 585 per indebted household in 1964-65 and Rs 1,434 in 1974-75; in Punjab and Haryana it was Rs 1,201 and Rs 1,648 in 1974-75, while it was Rs 629 for the composite state of Punjab in 1964-65. The other states with relatively high average debt were Gujarat (Rs 294 in 1964-65 and Rs 799 in 1974-75) and Karnataka (Rs 312 and Rs 750). It is interesting that even scheduled caste households had high average debt in the very states which could claim to have done better than other states in agricultural development.

An important piece of information gathered by the Enquiry relates to the disaggregation of outstanding loans into 'hereditary' and 'contracted' components and of the latter into cash, kind and mixed loans. 'Hereditary loans' are debts "transmitted or handed down from one generation to another". The average amount of such debt per indebted agricultural labour household had doubled from Rs 15 in 1964-65 to Rs 30 in 1974-75. Zone-wise, the average of hereditary debt was again the highest (Rs 53) in the northern zone. By and large, even hereditary debt was thus relatively high in the agriculturally developed states. Though hereditary debt accounted for only 5 to 6 per cent of total loans in all regions and states, the absolute amount of such debt per indebted household doubled between 1964-65 and 1974-75. The share of hereditary loans in total indebtedness was the highest (9.6 per cent) in the west zone consisting of Maharashtra, Gujarat and Karnataka.

The share of loans in kind in 'contracted loans' rose from 12.8 per cent to 14 per cent during the decade. The proportion may be low, but its persistence and even slight increase, as the persistence of hereditary loans, does say something about the slow-changing institutional structure of Indian agriculture.

The Enquiry shows that "loans taken for household consumption continue to be the single dominant factor responsible for debts", though their share of the total indebtedness decreased somewhat from 53 per cent in 1964-65 to 48 per cent in 1974-75. The share of loans for productive purchases, however, showed only a small rise from 11.9 per cent to 12.7 per cent in 1974-75, and the sharpest rise was in the share of loans for multiple purposes, 1.9 per cent to 14 6 per cent. All this is of some relevance because one of the complaints of the institutional credit agencies such as co-operatives and banks has been that they cannot lend more to the weaker sections of the rural population (like agricultural labour households) because their borrowings are essentially for consumption. This argument is only partially true, since it would appear that roughly one-half of the borrowings of rural labour households is not directly for consumption Further, as the Sivaraman Committee on consumption loans has emphasised, in the case of such poor families there could hardly be any distinction between consumption and production credit. Yet, the institutional agencies have not made much headway in providing finance to rural labour households This is amply evident from the Report

Moneylenders remained the single major source of borrowing for labour households. In 1974-75 "they accounted for about 48 per cent of the total debt raised by agricultural labour households" and, what is more significant, this share had shot up from 30.6 per cent in 1964-65. By contrast, the share of co-operatives had crawled from 5.1 per cent in 1964-65 to 5 3 per cent in 1974-75 (the share of co-operative credit for scheduled caste labour households had in fact declined from 4.7 per cent to 3 8 per cent). The share of commercial banks in total indebtedness of farm labour households was just 3 5 per cent in 1974-75 (no comparable data were collected in 1964-65); in the case of scheduled tribe households, also it was 3.8 per cent and even less, 2 per cent, for scheduled caste household.

Nepal

Buying Time

THE announcement that a referendum will be held in Nepal to ascertain whether the Nepalese people desire the existing Panchayati system to continue in its present form, whether they desire to have some reforms incorporated into it, or whether they favour a return to a multi-party parliamentary set-up marks an important step in the movement for reforms in that country. The announcement has followed more than a month of widespread protests and demonstrations which, in the face of repression let loose upon them, have occasionally turned violent. Even according to official estimates over 20 people have died and over 250 people injured. The protests were getting increasingly better organised during the later phase, and the Nepalese government itself had most reluctantly acknowledged that these protests had all the appearance of an organised political movement for democratic reforms. The announcement about the referendum in fact came just a day after the outbreak in Kathmandu of one of the largest and most militant demonstrations, to control which the Nepalese army had to be called out.

The attempt to contain and suppress the protests has followed the usual pattern of the stick and the carrot. The initial reaction was to let loose in full strength the forces of law and order against the protesters and simultaneously come down hard on real and suspected supporters of the movement. The arrest of the former prime minister B P Koirala on the startling charge that he, the leader of the most loyal opposition to the monarchy, was behind the violent incidents in Hetaura, shows how panicky and even self-defeating the original reaction of the Court was to the protests Counsels more sober and having a greater foresight seem to have prevailed—no doubt, being influenced by developments in other nearby monarchies in recent times; and the announcement of a referendum has to be seen as an instance of such foresight, intended to prevent the protests from taking an unpredictable and possibly quite dangerous turns B P Koirala himself (when he was released from detention on May 9) once again admonished his monarch that "if the present situation is let to drift, the danger is that the next phase will be more radical in which even the King might not be spared". Naturally, the most enthusiastic and even fulsome welcome to the King's proclamation has also come from Koirala himself.

With the proposed referendum expected to be completed "soon" (an autonomous Election Commission is to be set up within a week to supervise it), and with the expected vote for a restoration of the parliamentary form of governance, politics in Nepal is poised for some unexpected developments Internally, the restoration of parliamentary institutions and a multi-party

system would mean of fresh lease of life to broadly the same alliance of classes which have been in power in Nepal. The referendum, even while it speaks of a possible alternative political system based on universal adult franchise and secret ballot, does not specifically ask voters to pronounce any opinion on the role and functions of the monarchy itself which, as Koirala has repeatedly acknowledged, might be expected to continue to play a crucial role in any future political set-up. Also, with at least four former prime ministers (five if one includes Kirtinidhi Bista who has just resigned) continuing to be politically active, and with the Nepali Congress riven into factions on the question of the role of the monarch in any future democratic set-up, the restoration of a multi-party system in Nepal might only be the beginning of fresh struggles.

Under Mahendra and Birendra, Nepal followed the policy of maintaining a wary distance with India. With all its talk about being the only Hindu kingdom in the world and thus bound to India with unbreakable spiritual ties, Nepal retained a healthy wariness about its giant neighbour to the South and, as part of that policy, cultivated close economic and political links with other smaller nations of South Asia. Moreover, situated as it is a buffer between China and India, Nepal recognised the excellent advantages to which it could put this seemingly disadvantageous geographical position. The many concessions secured from both India and China show how skilfully it played one country against the other Given the dominant position of the Nepal Congress in the past, its general orientation and its closeness to powerful elements in Indian politics, it is a moot point whether in the event of that party's being able to recapture its past dominance in any future democrătic set-up, the careful neutrality maintained by Nepal in matters concerning other South Asian countries might not be slightly nudged into the position of 'a neutral in favour of India'.

It is unlikely that the political changes that have begun to take place in Nepal *will stop at a mere reform of the present* system of rule by royal decree or its substitution with rule by parliamentary decree. The changes that have begun are surely going to have a momentum of their own, though what precise shape they may take is still not clear. But of one thing one can be fairly certain: many others besides the people of Nepal would be anxious to keep track and if possible control the course of events — India being not the least important of them.

Credit Policy

Skirting the Issues

THE Reserve Bank has just completed yet another ritual of a meeting with the chief executives of scheduled commercial banks to review "the trends in monetary and credit situation during the last financial year" and, against that background, to outline the credit policy for 1979-80. Certain features of the background need to be noted.

Commodity prices, particularly those of manufactured products, which were on the increase even before the Central budget have started galloping since. For instance, in the first nine months, (April-December) of 1978-79, the general index of wholesale prices had risen only by about 1 per cent, yet prices of many key manufactured products had risen by 8 per cent or over: basic metals, alloys and metal products 8 6 per cent, non-metallic mineral products 10.6 per cent, rubber and rubber products 18.5 per cent, leather and leather products 17.3 per cent, and jute textiles 8.6 per cent. In the fiscal year ended March 1979, the price index of manufactures went up by 6.6 per cent and the increases in the above commodity groups ranged from 10 per cent to 30 per cent. By end-April, the index for the manufactured products group again rose to 193 2 from 187.1 at end-March 1979, a further rise of 3 3 per cent.

The prices of agriculture-based manufactures, which had not shown substantial increases earlier, have now joined the climb. The food products index has shot up from 164.1 at end-March to 171 at end-April, sugar from 159.4 to 169.8 and edible oils from 162 1 to 165.7 Textiles have risen from 182.4 to 188.6. Even the 'primary articles' index has risen from 180 8 to 184. The index for all commodities similarly increased from 190.5 to 194.3, and further to 196 8 for the week ended May 12, 1979. These trends are based on the official wholesale price quotations; in reality price increases will have been even sharper. Retail prices of various articles, including some items of mass consumption, have risen still faster.

With stocks of major agricultural commodities — foodgrains, raw cotton, raw jute, sugar, edible oils, tea and coffee — being very substantial, the commodity markets have no reason to provide an impetus to price increases Above all, there is the largest ever cushion of foreign exchange assets which has made possible liberal imports. These should have been expected to prevent any serious pressure on commodity prices. At the same time, investment activity has been subdued so that genuine investment and consumption demand could not have been large. Finally, cost of production has been kept down with restraints on wage payments and relative stability in the prices of wage goods during the past three years thanks to the bumper harvests. Only in some administered prices has some increase been permitted by the government. Cost-push could not therefore have played any major role in pushing up the prices of manufactured goods.

The data on credit and monetary expansion during the past three years, on the other hand, underscore the enormous additional liquidity that has been injected into the system. An increase of Rs 8,385 crores (or 63 per cent) in money supply (M_1) or that of Rs 9,590 crores (81 per cent) in bank credit to the commercial sector during the past three years 1976-77 to 1978-79, has obviously provided enormous liquidity, particularly to traders and merchant-manufacturers who would use their financial powers for speculative activities and for regulating supplies to the market with an eye to margins.

Yet for all that, the credit policy for the current year spelt out by the Reserve Bank Governor at his meeting with bankers still leaves everything to the central bank's proverbial 'moral suasion'. With bankers and large borrowers alike having an interest in large credit expansion, any policy which relies on their initiative in curbing credit is bound to fail. In the absence of concrete measures, none of the Reserve Bank's guidelines can be expected to bind bankers who have funds to deploy. Even raising incremental statutory liquidity ratio to 40 per cent would not restrain them They would default on statutory ratios; they would lend less to the priority sectors; but they would not lose their large accounts.

In 1978-79 a record volume of non-*food credit expansion* was allowed to take place — Rs 2,500 crores, compared with Rs 1,400 crores to Rs 1,600 crores in the preceding three years. Even if the bankers attempt to restrain credit to last year's level, which is very unlikely, the absolute amount of expansion would still be large. As for scrutiny of credit limits or scrutiny of large accounts, the existing banking system is ill-equipped for these tasks. Scrutiny of large accounts is prescribed as a ritual every time there is a runaway

credit expansion. The Reserve Bank's advice to bankers against valuation of collaterals based on future price expectations is no more relevant. Collaterals are always valued at current prices and bankers have neither the expertise nor the willingness to question the price quotations claimed in different purchase and sale transactions by their borrowers. Also, all these steps would be relevant, if at all, for grant of fresh or enhanced credit limits. In a short-term context, it is restraint on use of existing limits that will be more relevant.

As for return flow of funds from such industries as sugar and textiles, it is doubtful if any initiative taken by the commercial banks will bear fruit. After all, the holding of sugar stocks by the industry, though this has tended to push up sugar prices, has the blessings of the government.

These aspects of the new credit policy are thus largely irrelevant. The reforms promised by the Reserve Bank in the cash credit system and the system of participation certificates should be welcome but their impact will be felt in the long-term — and that too depending on the actual content of the reforms.

Congress (I)

Downhill All the Way?

A Correspondent writes:

THAT Indira Gandhi had to go in search of a constituency from which she could seek election to the Lok Sabha was a comedown enough for her; that she was prepared to face the far from certain prospects of victory at Thanjavur only underline her desperation; and the last minute reversal of the decision imposed upon her is a humiliation she could have well done without.

The developments in Thanjavur have once again shown that in sharp contrast to her earlier style of functioning, when she was the grand manipulator and others served her purposes, she is now herself being used by her own avowedly loyal followers and admirers. Indeed, as her immediate political future was being decided by Devaraj Urs, M G Ramachandran and even Morarji Desai, Indira Gandhi herself was forced to be a mere observer on the sidelines.

What is, however, relevant about the Thanjavur drama is not whether any pressures were brought upon by the Prime Minister on the Tamil Nadu chief minister not to extend support to Indira Gandhi with barely concealed threats being held in the event of his disregarding the Centre's 'advice', or whether the Karnataka chief minister played his by now well known ambiguous role by both supporting and opposing Indira Gandhi in the same breath, or even whether the Tamil Nadu chief minister was moved by no other consideration except that of ensuring that Thanjavur did not become a battlefield where political battles of an entirely different sort would be engaged upon by proxy; far more to the point is the fact that in the space of barely a few hours on the night of Sunday, May 20, Indira Gandhi was made to change her mind. So, once again, the plans to return to Parliament have gone awry; and very graciously, Devaraj Urs has repeated that Chikmagalur is available to her 'for the asking'.

Indira Gandhi's chagrin at being (for a change) so neatly made use of has been barely concealed. She has flatly repudiated the Tamil Nadu chief minister's contention that his lack of enthusiasm for her candidacy at Thanjavur was due to apprehensions that such entry would raise law and order problems; and while reiterating that her preference for a constituency from which she could enter Parliament was "always Chikmagalur" (a scarcely credible claim is that every preparation had been made to begin her election campaign in the Thanjavur), she has also expressed her annoyance and even apprehensions about the Karnataka chief minister. She was probably speaking nothing but the whole truth when, in answer to a question from a correspondent at Madras airport on Wednesday whether the Karnataka chief minister had anything to do with the Tamil Nadu chief minister's decision, she said "I do not know".

The poor response to the rally against the special courts bill ought to have convinced her that even within her own party, there is little enthusiasm to fight her personal battles. The substance of her speech during the rally only reminded one of the bad old days when she was ever ready to see in all opposition to her policies only prospecitve assassins of her and her family. Significantly, her latest utterances about the 'persecution' that she and her men are being subjected to are considerably less theatrical; the special courts, even though still considered as part of a programme of "political vindictiveness", are now acknowledged to be a "comparatively unimportant issue". This could of course be her own way of underplaying the seriousness of the endeavour of the Janata government to bring (however belatedly) the culprits of Emergency and every other excess that logically followed the original crime to book; but it also shows an awareness that her ploy of constantly harping on 'political vindictiveness' would not pay.

It is not as if there are no issues over which a serious political organisation can fight the present conglomeration at the Centre. But Indira Gandhi is peculiarly unqualified and ill-equipped to undertake the task because she, and even her party, have failed to make any headway from the apparently strong position they were in a year ago (soon after the split in the Congress) when it looked as if the rehabilitation of Indira Gandhi was just a matter of time. Despite all the help rendered to her by the Janata government by its own incompetence and worse, Indira Gandhi now appears to be in a far worse position politically than she was a year ago

LETTER TO EDITOR

Backward Class 'Benefits'

THIS is with reference to the special article on 'Backward Class Benefits in India, 1920-70', by Lelah Dushkin (April 7, 1979). In Table 2 the writer shows the position of Scheduled Castes (SC) and Scheduled Tribes (ST) in Class IV services (peons and other menials). The percentage is 18.64— i e, less than their proportion in the total population. It is enough to pass standard VII to be eligible for employment in Class IV services. Why their percentage even in this menial service has remained static is perhaps not clear to an outsider like Dushkin.

The fact is that this country is so caste-ridden that the superior officers and their families are themselves very caste conscious. Since these Class IV employees may have to work in the residences of the higher officers, or at least have to fetch a glass of water or tea for the officer while at work, the concerned officer is afraid that he might thereby lose his caste. This also applies to senior political leaders of the higher castes.

Is Realignment under Way?

Romesh Thapar

WE may not think that anything is happening in Bharat except a growing anarchy which is now beginning to take a toll of prices and the stability they enshrine. But this would be far from the truth. There is endless and frenzied activity of a political kind which keeps the readers of newspapers titillated. And the last few days have given us considerable titillation.

For weeks on end, to cite an example, the Capital was programmed into believing that May 16 would see a dramatic Congress(I) manifestation against the impotent Janata Party and that there would be repercussions all over the land. The gullible of both Right and Left persuasion serenaded these tidings to all and sundry. When Sanjay Gandhi, and some 200 mobsters, was permitted to indulge in a rampage against the shopkeepers of Janpath earlier in the month, it was seen as a dress rehearsal. After all, in the language of Sanjay, there's only one way of dealing with his Indian critics: kick them in the teeth.

The story was current through the first half of May that the Congress(I) mobsters were planning daily jail-going, with Sanjay in tow. This, it was said, would confuse the public when jail sentences passed in criminal cases were carried out. It is difficult to say who concocts these rather sophisticated forecast. Maybe, 12 Willingdon Crescent, where that frustrated and demoralised family lives which imagines that it has some divine sanctions to rule this land.

Came May 16. The great rally was a fiasco. In fact, it must have been difficult to persuade Indira Gandhi to attend the paltry gathering — and the vulgar showmanship was naturally highlighted by the lack of people. But — and this is important — a tame government did refuse permission to the mobsters to march through Connaught Place on another inevitable rampage, and there was enough police to control whatever assembled at Ramlila grounds. Will any lessons be learned by our ruling politicians who imagine that hired processions disrupting the city and closing in on Parliament are the stuff of democracy. In fact, along, this path lies fascism.

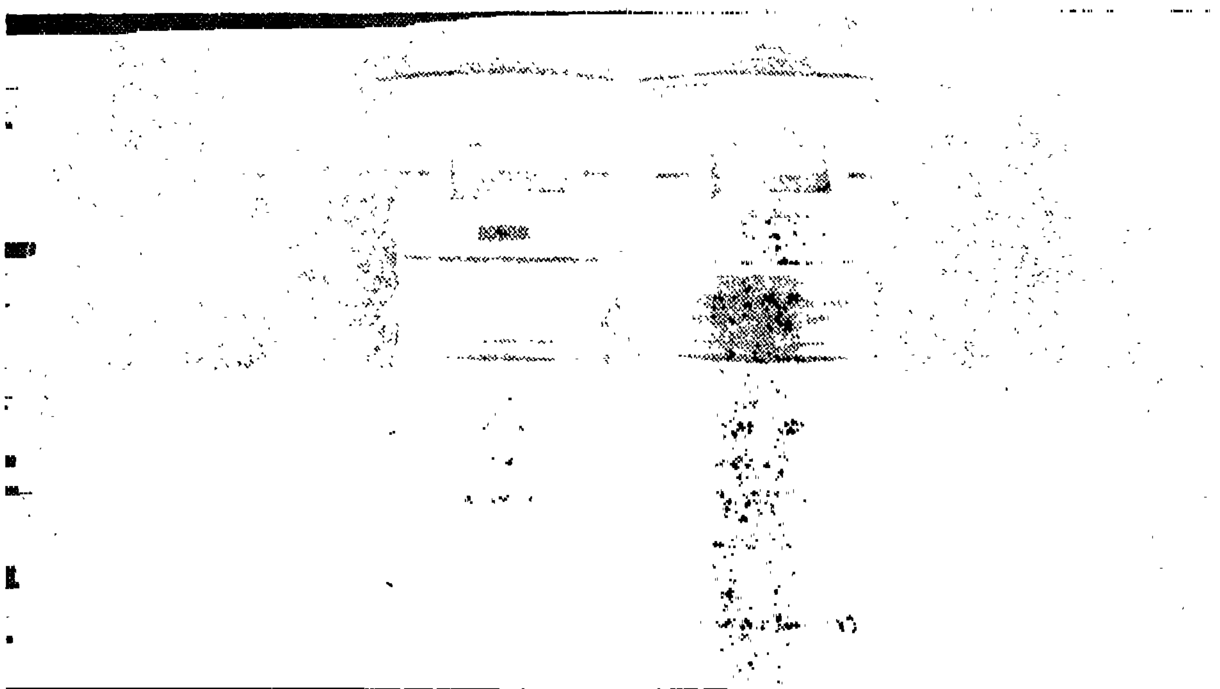
The police in the Punjab are in fact trying to give us a lesson in this area of governance. The misbehaviour of mis-be-gotten politicians against policemen who do not bow-knee, and the daily interference in postings to police stations so that the local SHO is the politician's willing tool, is not a new phenomenon. It may have assumed crude dimensions under inexperienced Janata ministers and civil servants who have given up any pretence to independence. But these practices were, after all, part of the former ruling family's methodology.

Clearly, a new constellation of political forces is attempting its adjustment with a corrupted and dissatisfied police force. The most drastic punishment has to be meted out to those who violate disciplines in these organisations — or else there will be no organisation left! — but fragmented, panicky ameliorative measures (as in the Punjab!) are the worst possible solution. They put power into the hands of the blackmailer, the conspirator, and those who are determined to hand this country over to authoritarian manipulators.

The easy way in which people in the Capital are comparing 1979 with 1974 suggests that the thought of another Emergency is very much with the well-to-do of the cities — and, probably, of the villages. To the extent that the crisis of the system continues to sharpen and become more complex, the fear is valid. But the political situation has passed beyond the patterns of the 1971 General Elections which gave Indira Gandhi and the Congress Party unprecedented power thoughout the country. That kind of situation will not return. The subcontinent is dividing among the major parties. Only new alignments among them are on the agenda.

These alignments are forever merging and dividing the politicians in all camps — even where they speak of "Indira is India". The alignment that is likely to come on top will have to demonstrate its ability to rule effectively during the tempestuous transition that India has to make in the coming years, a transition to a new and more workable economic and political system. So far, the perspectives are woolly. All the more reason, then, that governance should be more down-to-earth and more precise.

I think some such vague reasoning lies behind the surface consolidation that is taking place in the Janata Party behind Morarji Desai. He is aged and limited, served badly by those around him, but cannot be run off his feet like so many of his colleagues, old and young. That's the real trouble. No alternative 'captain' is emerging from our motley crowd of politicians who are even incapable of seeing the Constitutional Bill through Parliament. Charan Singh weeps over his isolation in the Janata Party parliamentary elections. But hasn't he realised that he no longer possesses a reassuring image.



The only positive developments of the past few weeks revolve around the first signs that the constituents of the ruling Janata Party are entertaining thoughts of splits. If the Congress(O) and the Jana Sangh/RSS groupings are intact, the Socialists, the BLD and the CFD are in a ferment. If George Fernandes, Madhu Limaye and Madhu Dandavate are not moving in step, Bahuguna is no longer Jagjivan Ram's confidant. Could it be that, as the question of double membership entraps the Jana Sangh/RSS, Atal Behari Vajpayee may take a bolder posture? No one really believes that the Janata Party is beginning to fuse. Maybe, it would be more accurate to say that these speculations are part of the realignment now under way.

It is worth recording as a footnote that the despair is now so widespread that large sections of opinion are beginning to wonder whether non-governance does not demand a shedding of the extraordinary powers government possesses. Today, these are being used only to escalate corrupt practice. A sobering through for those who see a free-wheeling India as an economic disaster zone, but who do everything to destroy the fabric of a socially-conscious democratic policy that has been sought to be built.

The roll call is frightening. Massive power house closures. Strikes on the railways — and elsewhere in the government system! — for bonus. Strikes in the coalfields despite three wage hikes. Controversies between the ministries over the availability of coal. Shutdowns on a large-scale for lack of power. Black money again flourishing. Demand for goods rising despite the rise in prices. Critical supplies of steel and cement disappearing from the markets. No priorities. No urgencies. If something works, disrupt it — like Air-India and Indian Airlines. So it goes on, into every field...

We certainly need to stop—and think.

May 19

Better Performance despite Excess Capacity

Hansavivek

GOODYEAR INDIA has barely maintained dividend at 6 per cent, despite better performance. It was able to sell the entire output in spite of the competitiveness in the market due to excess capacity in the industry. Sales increased from Rs 37.60 crores to Rs 45.39 crores and the outcome was a gross profit of Rs 367 lakhs against only Rs 79 lakhs previously. After necessary provisions, there was a net profit of Rs 76 lakhs compared to a net loss of Rs 45 lakhs previously. While last year's dividend came from past reserves, this year's payment is covered by earnings nearly 1.5 times. The company's exports declined from Rs 2.91 crores to Rs 2.15 crores, due to loss of Turkey as an export market, because of foreign exchange difficulties, and increased competition in international markets in general. Labour relations were strained throughout last year. Towards the end of the year, the company experienced a series of slowdowns in various production and service departments at the factory. This was followed by a tool-down strike. After seven days, the management declared a lock-out which lasted until March 22, 1979. Production was resumed from March 30.

There have been quite a few changes in the board of directors. C J Pilliod and T E Wightman resigned and J R Sardas and J E MacDonald were appointed to fill the vacancies. V Narayanan, sales director, was redesignated executive director with wider management responsibilities. N F Cope, managing director, and B M Robertson, director, resigned on March 6, 1979. V Narayanan was elevated to the position of managing director. J R Hicks and J E Purcell were appointed directors in place of B M Robertson and N F Cope.

SKOL BREWERIES' efforts at pioneering the cultivation of hops in Kashmir have been successful and have resulted in foreign exchange saving. This year's crop is expected not only to meet most of the company's own needs but also to leave some quantity for sale to other breweries. Demand for the company's beer continues to increase steadily. In fact, production had to be restricted last year having regard to the industrial licence. But this left unsatisfied demand in several parts of the country. Maharashtra, the principal market, was serviced first and foremost. But the future prospects of the company are uncertain because of the prohibition policy of the Central government, particularly because a major part of the equipment at the brewery is not capable of being used in the production of any other beverage. During 1978, the brewery produced 63,010 hectolitres of beer—against the licensed capacity of 50,000 hectolitres and installed capacity of 80,000 litres. Sales increased from Rs 217 lakhs to Rs 258 lakhs. With margins

enhanced, gross profit expanded from Rs 39 lakhs to Rs 61 lakhs. Net profit was Rs 47 lakhs (Rs 25 lakhs). Dividend stepped up from 9 per cent to 12.5 per cent was covered 3.45 times by earnings.

WIMCO's sales of matches have been adversely affected by the sharp increase in excise duty. Representations made by the company, employees' trade unions, chambers of commerce and by parties indirectly dependent on the company—such as farmers, tradesmen, and ancillary industries—and by consumers have not persuaded the government to revert to the pre-budget level of excise duty. The management is examining some new projects. Swedish Match Company has agreed to give the necessary technical know-how for those projects which are within their existing lines of activity. At the instance of Andhra Pradesh Industrial Development Corporation, the company proposes to make an additional investment of about Rs 13 lakhs in the equity shares of Cleanfoods Corporation which will increase its total holding in the company to 51 per cent. The company is setting up a project at Madanapalle in AP for manufacture of tomato paste. The proposed tie-up with this company would bring in an assured supply of tomato paste to WIMCO's subsidiaries, Sun-Sip and Chandigarh Super Foods, and it is also likely to result in good export business. Sun-Sip has already shown fairly satisfactory results in the very first year of operations. The plant of Chandigarh Super Foods has been overhauled and production commenced in March last. WIMCO's factory at Ambernath has introduced new cardboard matchboxes with printed friction. Sales of this new product are at present restricted to a few cities in Western India, as the capacity of the specialised machine is limited. This, however, has resulted in considerable saving of timber. Inner boxes, made of cardboard, are now being used in the Madras factory, thereby effecting further economies in the use of timber. The company has initiated a programme of rural development through silviculture of poplars which yield matchwood of good quality in about 8 to 10 years. Nurseries have been set up in Haryana, Punjab, UP, Assam, and West Bengal, to raise and distribute suitable hybrid poplar cones, entire transplants and seedlings free of charge to the forestry departments of many states as well as to farmers. In a joint report submitted by the Khadi and Village Industries Commission and WIMCO to the Central government, the extent to which the latter can extend assistance to the former has been set out. The report recommends, among other things, that government should give fiscal reliefs on cardboard and wax paper, create additional capacity for the manufacture of match wax, allocate adequate power and actively participate in the regeneration of matchwood. WIMCO's performance during 1978 has been good with sales, profits and margins higher than their respective levels of the previous year.

HERDILLIA CHEMICALS' application for substantial expansion of its phthalic anhydride plant, from 6,096 tonnes to 12,696 tonnes, is still being considered by the government. The company has also made an industrial licence application to endorse various by-products, based on in-house research and development, on its industrial licence. Some of these items will be marketed in India for the first time and will save considerable foreign exchange. The company is installing facilities for manufacture of phthalates like diallyl phthalate and butyl octyl phthalate. Meanwhile, the management is examining several other avenues of expansion and diversification so as to ensure future growth of the company. During 1978, all the plants operated satisfactorily and overall production of finished products was about 12 per cent higher than in 1977. Production of phenol and phthalates was the highest recorded so far but that of phenol was more or less equal to installed capacity. The company is in the midst of a renovation and modernisation programme of its cumene/phenol facilities. This will cost around Rs 2.5 crores and is expected to further improve plant utilisation and efficiency On sales of Rs 23 30 crores against Rs 20.45 crores, gross profit is up from Rs 4.75 crores in the previous year to Rs 5.24 crores. Net profit is Rs 1.91 crores (Rs 1.77 crores) and dividend, lowered from 25 per cent to 18 per cent, on the capital as enlarged by a one-for-two bonus issue, is covered 1.34 times.

ION EXCHANGE (INDIA) has earned an unchanged gross profit despite higher turnover. Viewed against the background of loss of production of the first quarter of the year due to an 'illegal' strike at the factory, this outcome is considered satisfactory. With reduced tax liability, net profit is higher, and the 24 per cent distribution on the enlarged capital is well covered by earnings. The company is seeking approval of the Controller of Capital Issues and RBI for issue of bonus shares. Work of expansion of capacity of the resin plant to 50,000 cu ft has been completed. The dispute regarding reclassification of Ion Exchange resins and levying excise at 40 per cent *ad valorem* is still pending with the excise authorities. The company continues to pay excise duty under protest and has been recovering it from customers. The subsidiary, Ankleshwar Ion Exchangers and Chemicals, has gone into production in January last.

WARNER-HINDUSTAN has achieved further growth of sales and profits during 1977-78, in spite of uncertainties caused by the drug policy announced by government in March 1978. Sales advanced by 21.8 per cent from Rs 10.41 crores to Rs 12.68 crores and gross profit rose by 19 2 per cent from Rs 213 lakhs to Rs 254 lakhs. The slight slackening of pace in the latter has been, obviously, due to rise in raw material costs. With the tax liability taking away a larger chunk, net profit is only a little better at Rs 77 lakhs (Rs 72 lakhs). Unchanged total dividend of 25 per cent is covered 1.2 times. Export sales expanded from Rs 15 lakhs to Rs 47 lakhs. With the improved liquidity position, the company redeemed the 3,00,000 five per cent preference shares of Rs 10 each on May 15, 1978. These shares were redeemable at par between May 11, 1979, and April 29, 1981.

NEW DELHI

The Impossible Package

B M

RAJ Krishna, Member, Planning Commission, seems to have earned a lot of criticism for his public warning that, unless proper steps are immediately taken, the much-vaunted price stability will soon yield to an inflationary spiral. His critics even argue that such a statement by a responsible member of the Planning Commission may actually induce a market psychology which traders would be only too glad to exploit. Such a criticism is indeed naive, because the Indian trader is very sensitively tuned to market trends and would act faster than would any structured official machinery or expert.

The fact is that, for all the past talk about price stability, official circles do seem to be anxious about the looming price increases. This has already resulted in the Reserve Bank, the Economic Affairs Department of the Finance Ministry, and the Planning Commission, giving a closer look to the inflationary potential in the situation. It has led, in turn, to a frantic search for measures which will forestall a price spiral. At this stage, the effort is confined to officials and experts in the government. It is, of course, unlikely that whatever officials and specialists propose following from their own analysis will be readily accepted and implemented by the political leaders. It will, indeed, be interesting to watch how the various groups of political leadership react to the 'package of measures' being assembled in Yojna Bhavan, the Economic Affairs Department, and the Reserve Bank to arrest inflation The first draft of a paper embodying the package has reportedly been prepared in Yojna Bhavan, and may become the basis for further policy formulations

Any talk of a 'package' to arrest inflation is reminiscent of the 1974 measures taken during Indira Gandhi's regime and enforced late in 1974. That had been a ruthless exercise, directed essentially at curbing demand by curtailing the purchasing power of the working people. A bonus cut was part of it. So was a steep increase in interest rates and ostensible curbs on credit expansion. Government expenditure was simultaneously sought to be contained — mainly by reducing and phasing out developmental outlays. It is widely acknowledged, now, that this combination of measures had brought about a recession and arrested growth. There is widespread apprehension, therefore, that if the present government, too, relies on a similar package it will spell disaster for the economy. But the planners contend that such repressive solutions may not become necessary. They argue that there is enough cushion available in the economy today, which was not so in 1974. Price stability can still be restored without sacrificing growth or cutting into the standards of living of the working people.

Planners, the Economic Affairs Department, and the Reserve Bank seem to broadly agree that three sets of measures would be adequate at this stage, if these are competently implemented The first set of measures would comprise tightening of control over private credit and an upward adjustment of the interest rate structure for trade and commerce as distinct from manufacturing. It is being argued that the commercial banks will have to be disciplined as they have been far too liberal with credit to private interests and have even violated norms set by the Reserve Bank. The second set of measures concern government expenditure with a view to reducing the extent of deficit financing The appointment by the Finance Minister of a Commission on Government Expenditure, under the chairmanship of the BLD aide and MP, S N Mishra, has not been received too well. It is stressed that the immediate need is to contain deficit financing What is needed in this context is a reduction — and eventually elimination — of food, fertiliser, and export subsidies, which serve no productive purpose but are cornered by sectional vested interests. Concern is also expressed about the mounting defence and other expenditure. Similarly, the loss of revenue from liquor sales and incurring of expenses on prohibition is thought inadvisable. However, both sets of measures have political overtones.

The third set of measures stressed is an efficient public distribution system for a few selected wage goods — in particular foodgrains, sugar, edible oils, and NTC cloth — at a maintained price level. The planners are rather concerned about Dharia's much-publicised expanded public distribution scheme, which they think would be not only wasteful but would divert attention from the purpose in hand.

An issue on which approaches seem to differ even among the planners is that of wage revision, bonus payments, and claims to higher emoluments on the part of employees in the government and public sector. While some argue that strong measures need to be taken to curb wage demands, there are others who contend that it may not be possible to do so without dislocating efficient production such that the loss thereby would exceed the saving in payments. It is believed that the so-called vicious circle of wage-price increase can be avoided if other measures are taken well in time to control prices of essential wage goods. That the more sober view of wage claims has prevailed may be seen in the negotiated settlement of coalminers' wages. The question of bonus for railwaymen, however, is becoming contentious because it has not mixed up with shifting group alignments within the ruling party.

Related to the question of wage revision is that of planned price revision — for instance, of coal for which an increase has been long overdue But planners are not quite so at ease about the pressure from the farm lobby for constant increases in procurement-support prices for agricultural commodities. The recommendations of the Agricultural Prices Commission for a further increase in the support price for paddy have thus come in for sharp criticism in Yojna Bhavan On the other hand, planners also deplore the clamour for a downward shift in prices when production and productivity grow — as with cotton and sugar.

However, the principal hurdle faced by those engaged in framing the so-called package of anti-inflationary measures is whether the politicians in power, presently at loggerheads with one another, will take a cool view and the needed steps in this situation The position is extremely disheartening in this respect Each group in the ruling conglomerate has its own constituency to serve and protect Hence the politicians will be ready to accept any measure which would hurt a rival's constituency but not one that would touch their own It is this warring to protect the interests of competing interests that will make an acceptance of a coherent policy most difficult.

MASS MEDIA

Marketing of Leaders

Mukul Dube

OPINION POLLS are, unfortunately, getting more and more readily accepted as accurate and reliable indicators of objective trends. A recent issue of *Sunday* (April 1) carries a report on 'What the Cities Feel', based on a survey conducted by the Indian Market Research Bureau (IMRB). The following is a discussion of some of the many things that seem to be wrong with the report.

The sample consisted of 1,367 men and women from five cities — Bombay, Calcutta, Delhi, Madras and Trivandrum. According to the 1971 figures, the populations of Trivandrum and the urban agglomerations of Bombay, Calcutta, Delhi and Madras, aggregate 20,390,476. Assuming a 20 per cent growth since then, the total would now be over 24 million. Assuming, further, that half are below 20 years of age, we are left with over 12 million adults. The sample of 1,367 thus forms 0.0112 per cent of those people from the five cities who are over 20 — or, slightly over 11 out of every one lakh.

There are means by which the representativeness of samples can be ensured, within limits; but this becomes less effective as sample size decreases. Some form of wizardry would be necessary to make a 0.0112 per cent sample representative. The analyst describes the sample as "fully representative", saying that this is because the "findings were weighted by income". In accepted usage, this would mean that wealthy people's opinions were treated as statistically more important than poor people's opinions, or *vice versa*, neither of which makes much sense. What this bit of jargon probably means is that efforts were made to achieve equal representation for all income groups.

Since nearly anything can be justified, however, by referring to limitations of time and resources, we must take the survey as it stands and see whether the best was made of a bad job. The first question, "In your opinion, who should succeed Morarji Desai as the Prime Minister?" is based on the assumption that Morarji Desai will, or should, cease to be the Prime Minister. This is bound to happen some day; the question however clearly implied that this succession will, or should, occur soon, for only four leaders who are known to be contenders have been named. Further, the question asks, apparently without asking — an old ploy — which party should provide the next Prime Minister as well as which faction within the Janata, should there be a preference for that party.

The text accompanying this question does not discuss these matters, but that is not the only gap in the analysis. The category 'Others', which comes to 12 per cent overall, shows a great deal of variation among cities. This needs to be explained, particularly in the case of Trivandrum (25 per cent). The names of these others were presumably not mentioned because they may have been too numerous and sometimes, unimportant to list. Was there, however, a pattern (or patterns)? If some names were mentioned more often than others, the analyst might have tried to look for pointers to the future.

Another omission, and a glaring one, is the absence of any explanation for the remarkably large residual category of 'Not specified/None' (30.4 per cent overall, and above 40 per cent in three cities). On the face of it, this indicates that over 400 of the people questioned tacitly believe that Morarji Desai will go on forever, or want no Prime Minister after him, or do not care. Any of these three, if true, is significant.

As regards the hidden question, of which party should provide the next Prime Minister, Janata collectively leads with 35.8 per cent against the Congress-I's 21.8 per cent. These are minimum figures, for 'Others' may include unnamed (unmentionable?) people from these parties. An important consideration is, would the supporters of individual Janata leaders withdraw their support for the party if it were to be led by a person not of their choice? An answer to this would show whether the people interviewed regard Janata as an integrated party, as opposed to a coalition.

This distinction between party and leader(s) does not seem to exist so far as the Congress-I and Indira Gandhi are concerned : The analyst treats them as interchangeable, and the figures justify this to a great extent. Answers to the first question give Indira Gandhi 21.8 per cent overall, and those to the third question, "Whom would you vote for?" (i e, which party), give the Congress-I 23 per cent overall; the difference is as small as 1.2 per cent. Comparing the responses to these two questions, however, we find that all cities do not equate the party and the leader. This certainly merits comment, for it may indicate that the Indira Congress is not led wholly everywhere by the person from whom it takes its name.

The second question is a straight contest between Morarji Desai and Charan Singh, which the former wins with a sizeable margin. It should be noted that this question, unlike the first, does not rule out Desai's continuing as Prime Minister; moreover, it assumes that the Janata will (or is likely to) provide the next Prime Minister and that there are only two contenders.

The manner in which the questions have been framed shows heavy bias in favour of Charan Singh. In an introductory paragraph, the analyst expresses the opinion that Charan Singh (who becomes, incidentally, more important when he gets the Finance portfolio than he was as Home Minister) has carried the entire Janata Party closer to the villages in people's eyes. A questionable opinion indeed, and one that obliges the analyst to express surprise at the 'high marks' notched up by Charan Singh in responses to the first question. These 'high marks' (15.2 per cent) may well indicate that the analyst's opinion was incorrect; nor should it be forgotten that three leaders of a party supposedly "closely associated with rural India" together gather the support of 35.8 per cent respondents, all urban. But then what are 'high marks'? The analyst gives this title to 15.2 per cent, but completely ignores the 30.4 per cent taken by another category in the same table.

The fourth ("Can Prime Minister Desai lead the Janata Party to another electoral victory?") and fifth ("Would Desai's exit from the Janata Party help or hurt the Party?") questions are fairly straightforward, and the analyst is correct in interpreting responses to mean that people believe that Morarji Desai's presence, though not as PM, would help the Janata. The high percentage (28.6) of "Can't say" responses to the fourth question has been mentioned, but neither it, nor the higher proportion (31.8 per cent) of the same response to the fifth question, has been explained. Surely it is significant that nearly a-third of the people interviewed are either not clear or are not concerned or are deliberately reticent about the country's Prime Minister.

There is another curious fact which the analyst has either not seen or not considered worthy of mention. "Can't say/Not specified" responses are remarkably high in Madras and

Trivandrum, compared to the other three cities, in the second, fourth, and fifth questions. How is this to be explained? Was the survey conducted differently in these two cities? Have Tamilians and Malayalis suddenly lost their ability to think and speak? Or — and this is a more likely explanation — do matters concerning the Prime Minister and the Janata not interest them particularly?

What really brings the value of such opinion polls into question is another report: 'What Caste Hindus Feel' (*Sunday*, April 8). The sample is again 1,367, which is too much of a coincidence. One is forced to conclude that, in the interests of economy — to get the maximum mileage out of one round of questioning — the same sample is featured in both surveys/reports. The second report contains the unequivocal statement, "For the purpose of ascertaining the views of caste-Hindus...1,367 people were interviewed". There can be little doubt that the 'city-dwellers' of the first survey are also solely caste-Hindus. It would appear as though Harijans, Muslims, Christians, and others who are not caste Hindus, have either ceased to exist or have all migrated to the villages.

All in all, such surveys show how 'market' research, with its quite flexible approach to reality and its popular image as a form of scientific investigation, can go well beyond its traditional role — that of an aid in the selling of soap Properly used, surveys and opinion polls can help in the marketing of those who are perched upon the highest soap-boxes of our polity.

KERALA

Politics of Rape

Mukundan C Menon

AVALAKKUNNU COLONY is part of the Nannampilli Municipal Ward, north of Alleppey in Kerala. The colony came up in 1955 with the government allotting plots to about 160 households. People belonging to scheduled castes, including 14 ulladar and seven harijan families, are neatly segregated in Avalakkunnu in a place commonly known as harijan colony. Besides these harijans, other settlers of Avalakkunnu are Muslims, Christians, Nairs, Ezhavas, etc.

Recently Avalakkunnu has been in the news following incidents of atrocities on harijans — particularly the kidnapping and raping of some harijan women. Gangsters belonging to affluent sections and enjoying political patronage of the ruling parties, have for long been active in Avalakkunnu. However, in the last few months, they seem to have run amuck, breaking into houses, kidnapping women and subjecting them to mass rape, and burning down the huts of those who resist. The victims have rarely ventured to speak of their ordeals since the aggressors belong to the higher castes and wield political influence. During the Emergency, these poor harijans were under the influence of the Youth Congress and a few of them even derived some benefits from such an association. Now, however, *while they are subjected to various* atrocities, including the raping of their women, the entire Congress bloc has not only disowned them but (as the statement of the Alleppey Congress leaders show) has also denied the raping incidents.

The Avalakkunnu incidents drew particular attention because it forms part of the constituency of the CPI chief minister, P K Vasudevan Nair. Interestingly, none of the CPI leaders has so far spoken about the incidents. M N Govindan Nair too, the CPI MP, who undertook at Delhi probably the briefest on record 'fast unto death' last year, to draw the Centre's attention on harijan atrocities in the North, has been silent on Avalakkunnu.

Padmini, 16-years old, lives along with her widowed mother, Pappi, in the harijan colony at Avalakkunnu. According to the statement made by the Home Minister, K M Mani, in the State Assembly on April 4, some miscreants entered the house of Pappi on the night of February 2 and demanded that Padmini be left with them. According to the minister, Padmini escaped and took shelter in the house of one Bhakthan. The miscreants chased her there and a quarrel ensued at Bhakthan's house. Some days later, on February 26, Bhakthan's hut was burnt down by the miscreants The minister also informed the Assembly that cases were registered against four persons (Prakasam, Philip, Thanakachan and Chandran) who had been arrested by the police. The minister, however, firmly denied that there was any rape However, this account does not tally with the account given by the victims a week later before the enquiry commission appointed by the state government.

According to the minister's own statement, it is worth noting the incidents took place about two months before they became generally known to the public. The episode, in fact, came to light only when some social workers courageously exposed the facts to the press and public. The district collector, after making his customary denial, was forced to visit the place. But he could collect little information as the visit was neatly arranged by the top brass of the district police. With more and more facts coming to light, government was forced to order its own enquiry.

The commission has till now had two sittings at Avalakkunnu, on April 9 and 18, and four girls — Kochupennu, Sarala, Kanaka and Padmini — besides several harijan leaders and social workers have so far given evidence. Both Sarala and Kochupennu told the commission that the attackers broke into their houses and bodily lifted them when they were fast asleep. They forced cloth pieces into their mouths when the girls tried to raise alarm. They were also *threatened with dire consequences at* knife-point. Later, both of them were subjected to repeated raping spread over 3-4 hours. Both victims told the commission that they could identify the criminals.

According to Padmini and her mother Pappi, Pappi was threatened with murder if she refused to leave her daughter with the intruders: Padmini too was subjected to rape at knife-point.

Bhakthan informed the commission that his hut was burnt down when he questioned the miscreants on the rape and molestation of his niece, Sarala. Several other people who saw the burning of the hut gave evidence too. One, Thankappan, informed the commission that he saw some miscreants forcibly taking away the women who were fleeing from the burning hut of Bhakthan. Krishnankutty, a one-legged petty shopkeeper and brother of Sarala's father, informed the commission that the attackers had threatened to burn down the whole harijan colony if he informed the authorities regarding the raping of Sarala.

The Kerala government makes many claims about the various benefits it has brought to the weaker sections — benefits which have obviously served the political needs of the ruling front partners than the needs of the wretched. Yet they *seem incapable of ensuring* the honour and safety of people such as the inhabitants of the harijan colony at Avalakkunnu — a settlement provided by the government itself almost 25 years ago.

WEST BENGAL—I

Collapsing Power

Timir Basu

THE power situation has deteriorated to such an extent that the government of West Bengal had to issue on April 10, 1979, a notification under section 22 of the Indian Electricity Act, 1910. By it, the industrial consumers were not to draw power for six days from either the high tension or the low tension systems of the Calcutta Electric Supply Corporation (CESC) and WBSEB. In fact, the availability of electricity in greater Calcutta had been as low as 50 MW for quite some time, against the peak-hour demand of 575 MW. The major industrial sectors in the state had suffered a total production loss of Rs 35 crores to Rs 40 crores in March owing to the unprecedented power cut. As the crisis assumed unmanageable proportions S S Dasgupta, chairman of WBSEB was saying: "We are still trying to analyse the situation and discover what has gone wrong."

When Jyoti Basu reportedly visited the control room of CESC, the CESC authorities are said to have apprised him of the alarmingly low coal stock at their plant sites. The poor performance of this once prestigious plant is not to be explained by its recent Indianisation as by a lot of other factors plaguing it for the last decade. Actually nobody knows how much the CESC can produce at its normal rated capacity. Not even half of Calcutta's requirements come from it. It is yet to be declared sick. Despite repeated representations by workmen, and the distress expressed in different media by consumers, CESC's age-old boilers, which outlived their normal functioning period some 20 years ago, have yet not been replaced — either at Mullazore or at Metiaburuz. Nevertheless, there has been constant expansion of its real estate holdings worth crores of rupees. Now there is a reported move by CESC to install two new boilers at its Mullazore power house, so that it can raise its generating capacity by 20 MW — a replacement which should have been executed much earlier. In fact, if all the old boilers of the CESC are removed and new ones commissioned, the power position would certainly improve.

The CESC has slowly but systematically cut down generating capacity over the last two decades on the plea that worn-out machinery had to be husbanded. Erosion of existing capacity may have been allowed because power trading is more lucrative than power generation Indeed, CESC today is primarily a power-distributing house While the CESC thus enjoys the cream, the government agencies bear the brunt of the staggering loss and consequent humiliation. And now, dependence on foreign expertise has made matters worse.

WBSEB, DVC and DPL — on which Calcutta city's supply system depends — are all in a bad shape, and the State Electricity Board's plants are facing chronic mechanical troubles severe enough to result in shutdowns. Indeed, four out of the seven units at Santaldih and Bandel went out of commission. The Bandel units supplied by the Americans may have served well, but they were overworked, ignoring the complaints of workmen. Unit 4 at Bandel was closed when everything went out of control. Unit 2, which broke down as a result of tube leakage, was brought to this state as overhauling was denied for a long time. Meanwhile, there is a shocking report that Unit 3, which had to be overhauled some 12 months ago, is still working in full steam and might any day develop cracks. The maintenance staff at Bandel is working under severe strain since the so-called campaign against sabotage went into full swing. One technical hand told this correspondent that an accounts clerk was planted at the plant to keep watch on workers who owe allegiance to 'extremist' views. Even engineers who fail to fall in the line with CITU are watched by the CPI(M) activists. The reported visit to the plant by the state information minister, who happened to be a youth leader of CPI(M), could not possibly help the working atmosphere at this plant in such circumstances. There are, moreover, the para-military forces who are still present in large numbers at the Santaldih plant.

The Santaldih power house — which hit the headlines, in June last, for what was known as "workers' indiscipline" followed by a series of penal measures and police actions under the notorious 'Murshed plan' — now stands as a symbol of inefficiency, mismanagement, callousness, lack of national sentiment, corruption, and last but not least naked utilisation of government offices to expand the influence of CITU. Santaldih has neither coal nor water easily available. Perhaps it is the only power station which depends entirely on the waters from another state. For drinking water, too, some 1,300 staff members depend on the Damodar flowing through Bihar 8 km away. The failure of this plant is the result of various factors. The inner tubes of the boiler of the third unit (which was commissioned in December last after much delay and was guaranteed for a year) were blown to pieces some weeks ago. True, boilers of ABV developed trouble, but BHEL is responsible for the installation of all the three units at Santaldih. Santaldih was the first in this country to use the 120 MW BHEL units. These 120 MW units could never pick up load of above 70 MW, though the rated capacity is 120 MW, thanks to the sub-standard Russian steam turbines.

None of the units was fully synchronised since they were put into operation. The boiler of the third unit is now out of commission. The tubes of the boiler were in a damaged condition and this was reported by the workmen concerned who refused to work it, apprehending an accident. However, the authorities reportedly advised continued operation. Finally, CITU laymen came to work and tried to raise the load above 90 MW to tide over the crippling power shortage plaguing this state. In the event, the tubes were blown up when the generating capacity reached 90 MW, it is alleged The boilermen in question were freshly-recruited as per CITU advice. At the time of Kamal Ghosh's dismissal, 57 heads were appointed on an *ad hoc* basis and thereafter another 147 men came to strengthen the otherwise thin CITU membership register.

Meanwhile, experts from BHEL and elsewhere have visited the plants to solve the difficulties of their own creation. From the very start, Santaldih has had mechanical troubles whenever the units are on load. At the beginning, five major areas of trouble were identified among others — boiler feed pumps, use of high viscosity furnace oil, breakers, seal oil system, and valve leakage. All these remain. BHEL experts have made modifications and faced fresh troubles that have reached proportions which no patch-work arrangement can surmount. BHEL equipment is clearly inadequate — notwithstanding the defence of BHEL expertise by P Ramamurthy which is an importation of second grade Russian technology. It is now well known that WBSEB engineers differed sharply with BHEL experts on a number of occasions — an instance is their disputing the earlier suggestions for modifications in the design of the boiler feed pumps which were nevertheless later incorpo-

rated in the feed pumps. Opinion is that tube leakage which has become a regular feature at Santaldih will not stop so long as bad equipment from BHEL remains in operation. Poor quality coal, thanks to mounting corruption in Coal India, is another important factor which damages machinery Unwashed coal with a high degree of free silica, etc, simply intensifies corrosion — thereby shortening the life of the tubes. The boilers supplied by ABV Babcock of Durgapur are not of good standard. But it is Babcock's workmen, who were retrenched during the Emergency by its management and which are now on the WBSEB's pay-roll to replace alleged 'extremists', who are now caretakers of their earlier employers' condemned boilers at Santaldih. WBSEB has staggering liabilities of roughly Rs 1,213 lakhs to BHEL. A 220 MW fifth unit is to be installed at Bandel by BHEL. Such high-capacity unit is a new experimentation even for BHEL. So Bandel will have to brace itself for the operations to come.

Meanwhile, the sense of complacency among official circles in the state as power from UP and Orissa has started to flow (Bihar will earn the handling charge for relaying UP electricity to Bengal) seems unwarranted. Dependence on other states is no surety in today's national power management. Closure of industrial units also is no reasonable way to tide over the crisis. Already, labour unrest is growing, and there are widespread industrial actions as not all central trade unions are ready to accept the forced lay-offs resulting from the failure of power policy. Enforcement of the Electric Supply Act had already resulted in disconnection of five jute mills and one big engineering firm If the situation does not improve, which is likely, more disconnections will result and employers are hardly likely to oblige with lay-off benefits

Nobody knows when the nightmare will be over — not even the power secretary, S M Murshed. A section of Press, which supported him earlier on stories of workers' indiscipline, has now turned away. The formation of an informal body — including the state Finance Minister and the Chief Minister's Political Secretary — to monitor information on power and to keep the Chief Minister informed on the power situation, may signify a silent relegation of Murshed. But such aggregative monitoring will hardly improve the plant-level problems or for that matter the working problems arising from the utilisation of government machinery to curb the influence of other trade unions. If the present working of the power plants is to be improved, the plants should be free from CITU toughs, the working atmosphere will have to be immediately restored to normal, technical hands given due importance and recognition, and partisan recruitment stopped. This is clear in the strike by the WBSEB Workers' Union demanding, among other things, reinstatement of dismissed chargeman of Santaldih, impartial probe into the actual cause of load-shedding and reduction in electricity rate. These are not really economic demands but essentially democratic and political ones.

WEST BENGAL—II

Defensive in Power

Jayanta Sarkar

EVERYWHERE in Calcutta, when people meet these days, they talk of the power shortage and of the dreadful prospect of having to live with it—with consequent loss of work—for months and possibly years to come. The authorities are rather on the defensive. The defensiveness is reflected in a sullen silence. As the crisis has dragged on, government spokesmen have chosen more and more not to share information with the people at large. The people are thus forced to live in the dark, literally and figuratively.

The few bits of information made public hardly amount to a coherent picture. The fourth 120 MW unit at the state's newest power station at Santaldih is expected to be commissioned soon, and the fifth unit at the Bandel plant should also go on stream by early 1980. The Calcutta Electric Supply Corporation's 240 MW Titagurh unit is expected to be switched on in 1982 or early 1983.

All this sounds promising, but it is not much of an assurance. Between 1966 and 1973, not a single megawatt was added to the state's generating capacity, though demand was rising steadily and overtook the supply. The lead-time in investment lost in that period cannot be made up quickly or easily. Besides, the situation would not have been so difficult had the utilisation of installed capacity been a little better. On some days, the generation falls to just about 40 per cent of the rated capacity. If, in the circumstances, people have developed a scepticism about deadlines of commissioning and expansion of capacity, it is a healthy sign. Experience has been that more units often do not mean more power. There is also the necessity of scrapping or derating existing capacity, besides that of ensuring proper utilisation of the workable units. When the promised Titagurh unit comes into operation, it is apprehended that nearly 100 MW out of CESC(I)'s present capacity of about 300 MW would have to be scrapped on grounds of age. Similarly, much has been made of the five 20 MW gas turbines—four of them for South Bengal and one for north Bengal—which are to be in operation by August or September. These are intended to act as a stand-by and supplement supplies during peak hours They are not designed to be run round the clock for any length of time. Being highly sophisticated, they would also need a very high level of maintenance. But now the idea seems to be to make them run as long as possible. A representative of the supplying company will be in India for some time to help in this, but maintenance and operation have to be done by the State Electricity Board.

Chief Minister Jyoti Basu, who holds the power portfolio too, is conscious more than anybody else of the need to tone up the operational standard at the power stations. He and other Left Front leaders are aware that part of the problem is the result of attempts to politicise the power plant workers under earlier regimes. To add to the Left Front's discomfiture, they have to live up to the image of a government committed to safeguarding the interests of the workers. Last year, Jyoti Basu caused quite a flutter in the Front's dovecots when he despatched a contingent of para-military personnel to make the workers at Santaldih 'behave' after a functionary of an extremist trade union was sacked. Given the choice, the Chief Minister would probably not want to repeat that performance. The Front leaders at one time talked about a 'political solution', but this has never been spelt out nor pursued.

The government is now looking for new men to take charge of some of the key posts in the power administration. But a few changes at the top can at best have a limited spread effect. Moreover, it is true that some of Jyoti Basu's trusted lieutenants could have played their cards with a little more foresight and astuteness and could have, at least partly, averted today's administrative void.

As in the case of the flood havoc in September-October last year, the Left Front is hamstrung by the alacrity of detractors to say: "Look, this government cannot even manage a situation such as this". It would be a pity if that, more than other plans and considerations, dictates its power policy and publicity.

REVIEW OF MANAGEMENT

May 1979

Review of Management is published four times a year, on the last Saturday of February, May, August and November.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

Sickness on the Side

EVEN as the government has been claiming a near-doubling in the growth rate of industrial production in 1978-79, over the rate of 3.9 per cent recorded in the previous year, it is clear that industrial sickness is also spreading at a rapid rate. While the government does not seem over anxious to update the data on the sick industrial units, what is available so far is revealing enough.

The latest data are for the first half of 1978. These show that, at the end of June 1978, there were 325 large sick industrial units with outstanding bank credit of Rs 956 crores. These were units with limits of Rs 1 crore and more with the banks. Just six months earlier, at the end of December 1977, the number of large sick industrial units had been 289, and total bank credit to them had amounted to Rs 858 crores. A year before that, at the end of December 1976, large sick units numbering 241 had drawn Rs 609 crores of bank credit. Going by this past steady increase and other current indications, it seems likely that bank credit to large sick units has by now crossed the Rs 1000-crore mark. Yet for all the pumped-in credit, sick units have tendency to remain sick. Even the few textile units and mini-steel plants which have during the past year or so improved their working, have not been necessarily able to come out of the red. This may well be because while the market conditions of some industries have improved, many units belonging to these industries are not in a position to take advantage of the better fortunes because of their inability to diversify production according to market demand.

Certainly, a comparison of the number of sick units, industrywise, at the end of June 1978 as against December 1977, suggests that the industrial growth has completely by-passed a large number of units in several industries. Sick units in the engineering, electrical, and iron and steel industries numbered 112 in June 1978 as against 96 in December 1977, in the textile industry 78 against 73, in jute 31 against 30, in chemicals 21 against 17, in sugar 31 against 27, in cement 5 against 3, whereas in rubber this remained the same. It is possible that the current standard explanations will be offered for this spreading sickness — that coal, power, cement and transport shortages as well as labour problems were the contributing factors. Yet these could hardly be the determining factors.

Rs 347 crores advanced to the sick units by the banks during the 18 months ended June 1978 have been justified as advanced to prevent the unemployment that might otherwise result. With the aggravation of 'sickness', incremental credit to sick units may well assume far larger proportions.

Though the credit to the sick units may dissuade the closure of certain units it also evidently does not help them to recuperate. Indeed, the assets against which banks lend to sick units seem to be heavily inflated — no doubt because such inflation makes possible the attraction to and the diversion of funds from the sick units. One reason why, despite the amendment to section 72A of the Income-Tax Act facilitating takeover of sick units by sound ones, there are very few cases of amalgamation, may correctly be found in this artificial inflation of the sick units' assets.

At the same time, IDBI soft loans for modernisation have hardly been tapped by the cement, jute, cotton textiles, sugar, and engineering industries. It is reported that of the 62 units to which funds are being disbursed, only two have drawn funds to the full. Modernisation and diversification, though they involve productive activity, are evidently less profitable propositions than the drawing and diversion of working capital funds. Lingering sickness in certain kinds of political economies is obviously a paying proposition.

Project Appraisal for LDCs

O P Sharma

A Guide to the Economic Appraisal of Projects in Developing Countries, Ministry of Overseas Development, London; Her Majesty's Stationery Office, 1977 pp ix + 169, £ 4 Net.

THE theory of social cost-benefit analysis in its modern form is of relatively recent origin, having its roots in the theory of new welfare economics. The starting point is basically the neo-classical competitive model which generates a pareto optimal situation under conditions of perfect market, homogeneity of goods and factors of production, convexity of production possibilities and instantaneous and costless operation of market forces. In such a scheme of things, social preference can be derived by mere mathematical manipulation of individual preferences. Even inter-temporal choice problems wither away by the assumption of perfect foresight and rational behaviour of economic agents.

Under imperfect competition, or in general when there is market failure, consistency between individual and social preferences is not achieved. There emerges a divergence between social and individual valuation. Time myopia creates a saving problem for the society which goes against the unrepresented future generations. Intra-temporally priorities get distorted and there is maldistribution of consumption among contemporaries.

These problems encouraged researchers into an altogether new area—that is, how to construct indices or yardsticks which could be applied to take socially optimal decisions. At the theoretical level, efforts are continuing to construct social welfare functions to satisfy certain minimum acceptable conditions. At the practical level, attempts are made to provide yardsticks to decide on allocation of investment or any other scarce resources from a social angle. The latter subject encompasses areas such as static allocative efficiency, development dynamics, inter-temporal and intra-temporal income distribution, nature of dualism, and structure of foreign trade.

One indicator of the growing importance attached to the subject in less developed countries (LDCs) is the increasing availability of guides or help books for ready use of project appraisers. These guides, however, have originated from the rich aid-giving countries or the institutions patronised by them. It is claimed that the aid donors are motivated to commission these studies to ensure smooth economic development of LDCs and in the process to make sure that funds provided by them are utilised properly. Another view is that, through projects selection, a sphere in which the techniques have been developed largely independently of planning methods, doner countries influence the formulation of national plans which is a matter of national sovereignty. There could be sharp difference of opinion on this. Still the increasing proliferation of appraisal agencies in LDCs, and the importance given to them, lends some credibility to the hypothesis

Between the two pioneering studies, one funded by the OECD[1] and the other by UNIDO,[2] the former has aroused more interest if the number of its followers and critics is a true indicator. It is being followed in practical *ex-ante* appraisal as well as *ex-post* evaluation by official appraising agencies in many LDCs; it has been applied by professional economists in case studies;[3] and its methodology has been used for appraisal of private foreign investment.[4] Attempts are made to integrate micro-project choice techniques to macro planning methods like Tinbergen's semi-input-output method.[5] Recently, there have also been some attempts to re-interpret the OECD methodology in a trade theoretic framework.[6] The present volume makes it clear to those who do not know yet, that the Ministry of Overseas Development of the United Kingdom also follows it to evaluate the projects funded by it.

The present volume, a revised edition of a less comprehensive one published in 1972, is meant to provide a practical basis for the economic appraisal of projects either financed by the public sector or seeking its approval. It is claimed that its methodology is such as to suit the time constrained and busy officials and that it is better than other methods, notably UNIDO method, as it requires less appraisal resources While going through the volume, it is clear that none of these assertions is wholly true. The claim, that the volume avoids theoretical issues and that it should serve as a practical basis for appraisal, is not sustained as all the theoretical issues are raised without necessary explanation. Polemics also take away a large part of the book. As for the comparison between the OECD methodology which the present volume follows meticulously and the UNIDO methodology, it is nowhere attempted in the volume in a meaningful manner.

From the point of view of this reviewer the volume can be divided in two distinct parts. Part one comprising Chapters 2-4, 6, 7 and Appendices A-C essentially give the details of the methodology of economic appraisal and illustrations for our understanding; in Part two we include only Appendix D which gives check lists of basic data relevant to appraisal of projects.

The basic thrust of Chapter 2 is to give yardsticks for valuation of labour, material inputs and outputs when the objective is to maximise allocative efficiency It is rightly pointed out at the outset that correction should be made for inflation but the importance of such adjustment is not clearly explained.

The problem of inflation is relevant to the investment projects in LDCs for two reasons: (i) with passage of time when projects face teething troubles, generally there are slippages which even with historical rate of inflation escalate project costs beyond proportions, and (ii) even if prices of inputs and outputs change uniformly within a sector, the ranking of projects might change due to differential rates of inflation in different sectors.

In valuation of inputs and outputs, there are essentially three things to do when the suggested methodology is followed. First, classify goods among traded and non-traded; second, identify the source of unskilled labour; and third, identify and if possible quantify externalities. Traded goods include goods that are actually traded or would be traded when country concerned follows optimal trade policies. Non-traded goods are those which are either banned or provided locally at substantially higher prices during the life of the project. Non-traded goods have labour inputs, traded good inputs and non-traded good inputs. Final identification and quantification of the social cost of these goods is thus more or less a standard problem in matrix algebra Empirically it could be calculated from a detailed input-output table, if available.

Once the break-up job is over, the rule is that labour, traded and non-traded goods should all be valued at their shadow prices. In case of traded input or output, these shadow prices are

approximately average border prices (or marginal border prices if the project is big enough or when there are quantitative restrictions in trade) adjusted for costs of transport and distribution. Non-traded outputs, which are sold — e g, electricity, water, housing, etc — can be valued in terms of their marginal social benefit to consumers which can be approximated by a relevant conversion factor adjusted for consumer surplus. Similarly, when non-traded goods are an input, output conversion factors are used for social valuation. The output conversion factor in simple terms is the weighted ratio of world prices to domestic prices excluding taxes and subsidies of other traded inputs Where the project output is non-tradeable and not sold, valuation will depend on the project's contribution to national objectives and income status of the beneficiaries.

Under a decision reflecting pure allocative efficiency, labour will be valued at its shadow wage rate which is taken as the opportunity cost at margin in terms of output foregone elsewhere adjusted for extra consumption cost of shifting labour to the project site. Like the use of conversion factor in valuation of material inputs, consumption conversion factor is applied as a standard device to convert market cost of labour to its social value Again, in simple terms, the consumption conversion factor is a weighted average ratio of world prices to domestic prices of a representative bundle of goods consumed by labour In case of externalities, the problem is mainly of identification of hidden inputs and outputs, linkage effects, indirect employment generation, consumer surplus and international effects Except for consumer surplus, other forms of externalities are neither important nor do they require separate valuation since these are already taken care of while calculating shadow prices of goods, shadow wage rate of labour and saving premium.

Suppose allocative efficiency is the basis for investment decisions, what are the pros and cons of the results generated by the valuation rules mentioned above? The related questions are: (i) are the shadow prices (that is prices reflecting optimal policy choices) really relevant to the LDCs where optimal policies are not followed many a time, (ii) are there a unique set of shadow prices for continual use in project appraisal; (iii) are border prices a good proxy for shadow prices, (iv) are conversion factors theoretically and empirically sound parameters to value non-tradeables and unskilled labour; and (v) what is the applicability of the set of rules suggested for valuation.

The basic premise for using shadow prices, though not spelt out in this volume, is that the developing countries will gradually follow optimal policies. But how does one estimate these shadow prices for an *ex-ante* appraisal. Obviously, *it is not correct to use shadow prices* from optimal choices already made as these could change substantially when a new project is introduced. This implies that there should be changing set of such prices as the situation changes. Calculation of this set of prices, by iteration and re-iteration, meets the criticism but practically such an exercise is not feasible at least in developing countries where project ideas do not spring up so frequently.

Also, in the long run, resource allocation could be based on these optimal prices if market distortion fades away — which is highly doubtful if one has a look at the industrialisation process of the more advanced among developing countries. In such situations, application of shadow prices on a selective basis introduces new biases without eliminating existing distortions. Despite a good amount of literature on the subject, a perfect method of calculating shadow prices is hardly available. This could be one reason why shadow prices in various case studies differ so widely.

The volume presents no justification for using world prices as a proxy for shadow prices. Little and Mirrlees justify it on the ground that: (i) domestic prices are distorted in LDCs; (ii) export-import prices can be collected more conveniently and further corrections therein are easier; (iii) most industrial projects are export-expanding/import-substituting type and therefore the opportunity cost at the margins is measured in terms of the project's influence on the balance of payment.[7]

These arguments imply that, at the margin, trade is indeed a feasible additional production possibility to the developing countries and that there is virtually full integration of the domestic economy to the world economy. It also implies that goods are either traded or non-traded and that no goods are partially traded. This is not quite true, and in many cases the implications of a project on the domestic economy cannot be analysed *via* its balance of payments effect.

There have also been arguments against using world prices for resource allocation on the ground that: (i) ruling world prices involve unequal exchange and ultimately lead to widespread negative transfers from developing countries to the developed countries; (ii) using world prices involves an implicit assumption that outside the domestic economy, there is rational allocation of resources which is not quite true; and (iii) world prices are not just supply-determined as implied in the present volume; these also reflect *the preference pattern of rich countries* holding a major share in world trade and production, and therefore their use as shadow prices has implications on the objective function of developing countries. These are by now fairly well-known arguments against the existing world economic order, and for a more equitable re-distribution of world income.

In economic appraisal of investment proposals, however, it is better to avoid such value judgments.

Even when there is general agreement that for a project which effects trade, world prices should be used merely because they reflect opportunity cost to the domestic economy, there remain problems of choosing from among a number of prevailing 'world prices' for the same, or similar products. Evidence on world prices amply demonstrates that transport cost and distributive margins do not wholly explain the differences in prices charged for the same or similar products by different suppliers. Similarly, there are problems in valuation of goods supplied under tied aid or bilateral trade agreements. Also, since the inputs and outputs are to be valued in the years in which they occur, there remains the problem of forecasting a correct price for valuation of output when construction period of the project is rather too long.

On conversion factors, the volume does not present any fresh ideas about their theoretical or empirical basis. Hence these are not amenable to criticism After the concept was introduced in the OECD volume, one expects that further literature on the subject should throw some light on the methods of calculation, feed-back mechanism, consistency, and verifiability of the conversion factors.

In valuation of unskilled labour, the approach followed is too general and escapist. Para 52 provides an illustration where after making the correct observation that social wage rate varies by sector, location, skill, and even season, it is assumed for simplicity that these are *constant over* time. But soon it is surmised that, if social wage rate is believed to change, then their forecast becomes necessary. How to make the suggested forecast is perhaps not the concern of the volume. It would have

been better if (i) the concept of social wage rate would have been clarified more appropriately and implications of using a range of such wage rates given explicitly, and (ii) the alternative use of labour for calculation of shadow wage rate should have been specified

The treatment of externalities is practically useless, except when the authors remind the user of the Guide in para 70 that he should keep "his eyes and ears open because the area is strewn with misplaced optimism and value judgment". Despite this, it is argued in a highly mystifying manner that there are reasons to believe that, if we follow the Guide, we shall not make major mistake in calculating present value net of the hidden goods. While not mentioning any reason for this belief, the authors persist in saying that for all these reasons it is suggested that resources available for project appraisal should be diverted to the valuation of hidden inputs and outputs only when these appear to differ from project to project and are likely to change". Such observations are not of much use in the high practice-oriented subject of project appraisal.

A more practical suggestion would have been to assume that hidden costs and benefits cancel out each other. Even the margin of error on account of this assumption might not be as much as might be due to the value judgment of the appraiser. The treatment of linkage and multiplier effects is no better. It is no novelty to point out that the multiplier effects are relevant only when there is slack capacity

A more interesting problem in LDCs is the valuation of goods of public utility-service sectors such as water, electricity, housing, transport, etc It is argued in the present volume that, in such cases, consumer surplus should be treated as a hidden output and necessary correction for this should be carried out in the benefit stream of the project. In practice, valuation of consumer surplus is very difficult. By definition, consumer surplus is the difference between willingness to pay and what is actually paid by the user. In the sectors mentioned above, administered prices charged are quite low, resulting in budgetary strain and sub-optimal utilisation of the products. Willingness to pay depends on alternative possibilities of getting the product and their end use. In LDCs' alternative possibilities are quite limited. It means that the willingness to pay essentially reflects the price that can be paid only by the well-to-do. Thus the value of output inclusive of consumer surplus may be inflated even on pure efficiency grounds. In fact, the problem in such cases is to fix a reasonable rate of return and only then can one say whether the users are enjoying any extra benefits.

Chapter 3 deals with the relevance of inter-temporal and intra-temporal distribution issues to project a choice when general economic policy tools are not feasible. In choice involving contemporaries, weights are designed such as to give more importance to consumption as well as saving of the poor. The social cost of the project, where distributional issues are considered, is derived by taking net additional consumption (that is, excluding taxes and savings) adjusted to world prices by using a consumption conversion factor and increased to the extent of the savings premium. Savings premium, in simple terms, is the ratio of weights attached to savings and consumption. The treatment of the concept in the present volume is simplistic and does not clarify the time path of the savings premium which is ultimately determined by the time path of rates of change of saving and consumption. These two rates are nothing but the accounting rate of interest (ARI) and the consumption rate of interest (CRI)

The explanation for a savings premium lies in the generation of sub-optimal savings in the developing countries. This is ably argued in the present volume (paras 86 to 91). However, the point that premium on saving conflicts with the employment objective (more appropriately expressed in terms of shadow wage rate) is not clearly brought out The neo-classical type of reasoning followed in last line of para 86 — that is, lower savings lead to lower investment and reduction in growth rate and consumption in future — may not be found appealing by many economists, particularly those emphasising excess capacity and lack of effective demand in LDCs The difficulties encountered by the project appraiser when distributional issues are introduced are, however, clearly pointed out in the volume. In the views of this reviewer, it is better to leave out these issues from project appraisal and to allow these to be settled by other appropriate policy instruments

Chapter 4 is of particular importance as it deals with choice of an appropriate discount rate and decision rule. The discount rate chosen is the accounting rate of interest in OECD terminology. Two basic rules for the choice of this rate are: (1) it should be equal for all sectors and (2) its level should be such as to exhaust the investible resources. The actual level of the rate is stated to depend on rate of inflation, accounting prices and consumption weights. It is pointed out that the rate of discount or target rate of return used by the Central authorities can be taken as accounting rate of interest and that a discount rate of 10 per cent is a useful operational guide (para 105).

Apart from the fact that no basis is cited for choice of 10 per cent rate of discount, the arguments put forth in the volume do not help in our understanding of how the rate is determined. After all, the rate varies from country to country. One gets the impression that the accounting rate of interest is determined, as in equilibrium analysis, by demand and supply of investible funds. That is why lower limit to the level of ARI is set by the rate of interest on marginal (most expensive) funds borrowed from abroad. The analysis in the volume does not throw any light on the relation between the domestic capital market, reasonable rate of return, and ARI. The reliance on a particular ARI is overemphasised in making investment decision.

It is for this reason that the net present value (NPV) criterion is considered better than internal rate of return (IRR) criterion. Once there is doubt about the discount rate chosen, NPV becomes a doubtful decision rule. However, there are problems with accepting IRR as the sole decision rule — for example, non-uniqueness In any case, the two rules are not always mutually inconsistent. Moreover, one cannot escape the use of a social rate of discount in project choice. The guide towards the end of Chapter 4 correctly emphasises that IRR or NPV may not be final word in choice of projects. Those who are actually engaged in the task of project appraisal sometimes find to their surprise how true this observation is.

The more useful material from the point of view of an appraiser is available in Appendix D, that is check lists of basic data. The areas covered are Transport, Services and Production Sectors (which includes agriculture, irrigation, petro-chemicals, fertiliser, forestry, wood processing, and tourism). There is increasing need being felt for a standard format for preparation of feasibility reports The check lists provided in the volume are highly deficient if these are to serve as guidelines for preparation of feasibility reports amenable to smooth and efficient appraisal

If on the other hand the purpose of

these check lists is just to get information from the project authorities for quantification of benefits and costs, then quite a large number of items are irrelevant. Moreover, the check lists for a number of sectors lack systematic presentation. In fact, the Ministry of Overseas Development can as well bring out a separate volume on this important aspect of project appraisal. It is surprising that, in the whole text, there is no reference to this important Appendix. After all, project appraisal is still the forte of general intellect of the appraiser, basic data in a standard format is a bare necessity to him. Fortunately, a beginning has already been made in this direction by Project Appraisal Division of Planning Commission.[8]

Excellent exposition, good layout, and concentrated brevity are good features of the volume. The last one is, however, at the cost of a fair treatment to the subject. Those who are well acquainted with terminology of OECD volume may find it an easy reading. Others, even when they rush frequently to a glossary of terms given at the end in the volume, may find it difficult to grasp the contents in the first instance.

Depreciation Practices and Dividend Decisions in Joint Stock Companies

N L Dhameja

The study relates to depreciation rules and practices among Indian Joint Stock Companies and shows how these practices influence their dividend decision.

The study is divided into five sections. Section I discusses the various depreciation laws and the practice of the changing depreciation method. The effects of the changing depreciation method are analysed in Section II. Section III collates the practice of depreciation change and the issue of bonus shares. Section IV reviews the various depreciation practices. Summary and conclusions are presented in the last Section.

I

Depreciation Laws and Practices

UNDER the Income-Tax Act 1961, depreciation on fixed assets other than ocean-going ships is to be provided on the written down value (WDV) method for assessment of income for tax purposes.[1] However, for financial reporting purposes, under the Companies Act, 1956, as amended in 1960, the companies are given the option to provide depreciation by the WDV method or by any other method so as to write off 95 per cent of the original cost within the specific life of the assets.[2] In other words, there is an option to provide depreciation for reporting purposes by any of the methods—such as written down value (WDV), straight line (SL), or sum of digits method; while for taxation purposes, depreciation must be provided on all fixed assets other than ocean-going ships on WDV method. In this study, depreciation for reported purposes is termed 'Financial Reporting Depreciation', and depreciation for tax purposes is termed as 'Tax Depreciation'. This accelerated method of 'Tax Depreciation' encourages companies to write off their investment in fixed assets as early as possible and is a postponement of tax liability.

In India, the sum of digit method of depreciation is not common and the SL and/or WDV methods are generally followed for reporting purposes. The SL method distributes the depreciation charge evenly over the life of the assets. Such a charge is lower in early years as compared to that of the WDV method. For instance, at a depreciation rate of 20 per cent under the WDV method, the depreciation amount per annum would be higher for the first five years as compared to under the SL method so as to write off 95 per cent of the cost of that asset over its life. In general, the lower the rate of depreciation, the longer will be the period for the 'Tax Depreciation' to be higher than the 'Financial Reporting Depreciation'.

By following the SL basis of depreciation for reporting practices, there is a difference between 'Financial Reporting Depreciation' and 'Tax Depreciation'. The straight line method enables companies to show better financial results in the early years of fixed assets acquisition. A number of companies change their method of depreciation from the WDV to SL method to take benefit of lower depreciation charge in earlier years. This section deals with the practices of changing depreciation methods and the impact of such change on reported profits and dividend practices.

The study relating to depreciation practices is conducted by analysing the balance sheets of companies for various years. It covers 23 companies from different industries or companies from different growth categories. The study relates to the period of the year of change of depreciation by a company upto the last balance sheet available for that company. Hence the period covered varies for each company.

The companies studied can be classified as those changing their depreciation method with immediate effect for the prospective period and those changing with retrospective effect from some past date.

Of the 23 companies studied, three companies changed their depreciation method only for the prospective period, while the remaining 20 companies changed their depreciation method with retrospective effect, adjusting for the excess depreciation provided under the WDV method in earlier years. Of the total difference between 'Tax Depreciation'[3] and 'Financial Reporting Depreciation' (called 'Total Depreciation Surplus') of Rs 3,840 lakhs, about 30 per cent related to the earlier periods, ie, for the years before the date of change of depreciation (called 'Retrospective Depreciation Surplus'), while about 70 per cent, ie, Rs 2,628 lakhs (called 'Prospective Depreciation Surplus') was for future years, ie, for the years after the date of change.

Change with Immediate Effect

The companies changing their depreciation method from the WDV to the SL method with immediate effect for the prospective period had the following features:

(i) They had good profit records and had followed 'non-decreasing dividend policy'.

(ii) They made high investment in fixed assets, and changed to the SL method 'to even out the burden of depreciation as much as possible over the years' and 'to obviate wide fluctuations in the amount of depreciation to be provided in the financial accounts from year to year'. The change in some cases was only with respect to plant and machinery acquired during or after the year of change.

(iii) Three companies changing their depreciation method with immediate effect, accounted for about 37 per cent of 'prospective depreciation surplus' or 25 per cent of 'total depreciation surplus'.

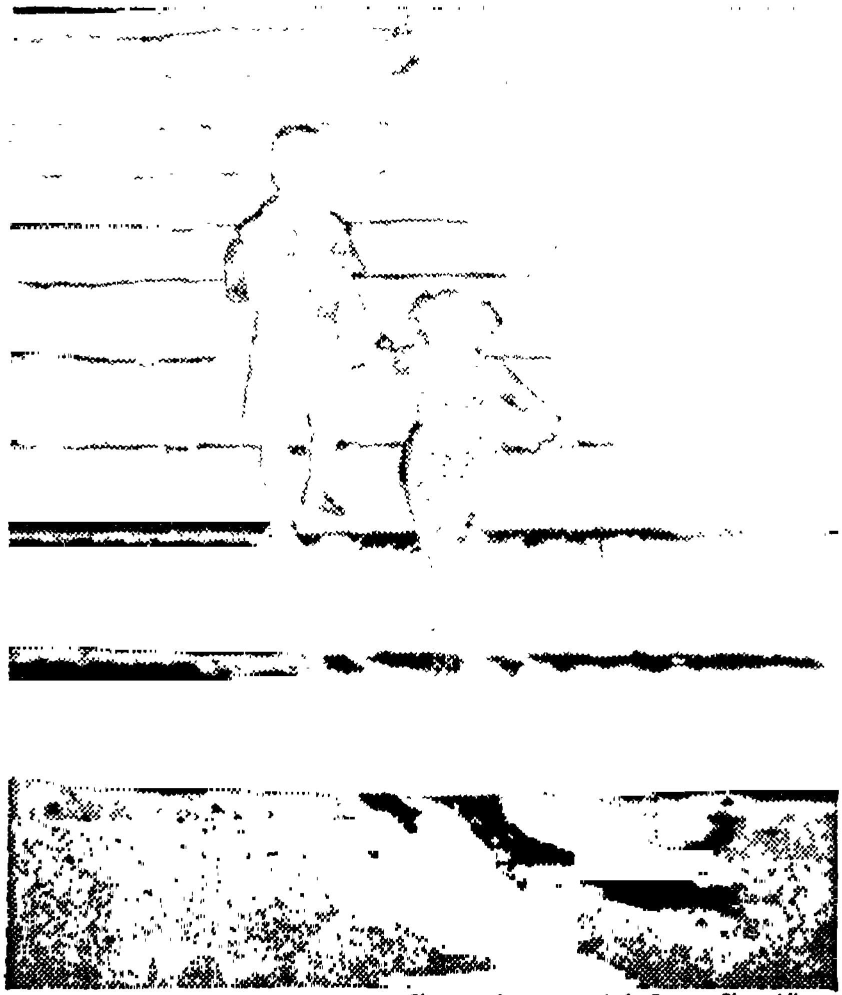
Changing with Retrospective Effect

Twenty companies, having changed their depreciation method with retrospective effect, are as follows:

(a) *New Companies set up after 1955:* Of these 20 companies, four were new companies set up after 1955 and had the following features:

(i) four new companies—one cement and three engineering companies—changed their depreciation method with effect from the date of their incorporation and were non-group companies;

(ii) with high investment and expansion programme, they were caught in a recession spiral before their gestation period was over and reported losses in a number of years before such a change;



(iii) they switched over to the SL basis 'to avoid excess depreciation charges in earlier years'. The WDV method was described as the conventional method, while change to SL method a 'realistic and in the general interest of the company', or 'logical as the burden is according to the capacity to bear the burden—heavier at a later stage when the capacity to bear burden is greater'.

In one company, depreciation charges were brought into line with current estimates of the useful lives of the assets, as past estimates were too low and depreciation was charged on the SL basis so as to avoid excessive depreciation charge in earlier years.

(b) *Companies set up before 1955:* Textile industry had the largest number of companies changing their method of depreciation and one observes the following:

(i) they reported rising cost of production and declining profits;

The future belongs to those who seek it

Photograph courtesy. Agfa-Gevaert Photo Library

**Whether you seek it or not, the future arrives.
But you have a choice—to make it yours.
We have chosen a future based on better technology, better products, better investments and better management—and an enduring process of change!**

To most housewives in India, Hindustan Lever is the supplier of well-known products—Sunlight, Dalda, Lux, Lifebuoy and a host of others. But this company has grown and changed especially in the last five years—so much, that we thought we should tell you something about it.

Do you know that about 60% of our total investments in fixed assets today are in projects in the core sector or sophisticated technology? That we have an investment of nearly Rs. 3 crores and a recurring expenditure of about Rs. 1.5 crores per annum in the largest private sector R & D Centre in India? That over 50% of all our managers are scientists and technologists?

A company goes the way its capital is invested and its management chooses the direction. Our direction is clear: technology-intensive sectors of national priority.

HINDUSTAN LEVER LIMITED
A changing organisation

HLL-19-234

(ii) of these companies having change in method of depreciation with retrospective effect, in about half of textile companies (six in number), the change was with effect from a period before 1957. Two companies belonging to a large business group, changed their method of depreciation to the SL basis with respect to plant and machines in 1966. These companies were not in a position to show better financial results due to slack demand for cotton and rising cost of production without any increase in selling price, and they decided in 1969 to change their depreciation method from the date of incorporation and the excess provision for depreciation was credited to profit and loss account, Such decision was stated to be made to maintain consistency and uniformity;

(iii) of these textile mills, about two-thirds were group companies, or were medium and low growth companies of small size;[4]

(iv) the change of depreciation method among low growth companies having a decline in their profits was described to have a 'true and better presentation of accounts' and the SL method of depreciation was described as 'appropriate and more convenient method'. On the other hand, among companies of high or medium growth the change was described to 'spread out the burden of depreciation on substantial addition to machines equitably over the years'.

Further, paper, engineering, and rubber companies changing their depreciation with retrospective effect were small in number, were mainly group companies, and had medium growth. Due to increase in investment, they changed their depreciation method to the SL method and described it a 'scientific method'.

In short, the practice of changing from the WDV to SL method, (a) was found to be followed in textile companies, particularly small size companies of low growth, and those belonging to large business groups, to camouflage their true financial position and withdraw from the business to the maximum possible extent; or (b) it was followed by companies, from textile and other industries, with a large expansion programme but squeezed between controlled selling price and rising production costs. Engineering companies caught by recession, changed their depreciation method so as to jack up profits.

From the above, the reasons for change can be summarised as follows:

(i) to reduce the burden of depreciation on fixed assets in years of large investment and in years of rising cost of production so as to have a 'true and better presentation of accounts'.

(ii) to identify specific property with specific values. In other words, to spread evenly and logically the burden over the life of assets according to the capacity to bear the burden and to obviate wide fluctuations of depreciation charge. This will help new companies to bear a heavier burden at a later stage when its capacity to bear that burden also becomes greater.

(iii) Lastly, as reported in a research study on depreciation practices of companies,[5] the market value of imported plant being more than its original cost, the SL method enables the companies to reveal better profitability, and the book value of the asset is nearer to the market value than it would be in the case of the WDV method.

II

Effects of Change of Depreciation

The effects of depreciation change from the WDV to SL method can be classified in two categories:

Jack-up of Profits: Depreciation under the SL method being lower than that under the WDV method in early years, the profits get inflated by the amount of such difference. But after a stage when depreciation under the WDV method reduces and is lower than that under SL method, this effect of inflated profits will get nullified. This will depend upon the rate of depreciation, and the expansion programme of the company. For instance, in Premier Tyre Limited upto the year ended March 31, 1971, 'Tax Depreciation' was greater than 'Financial Reporting Depreciation'; but after 1971 it was lower, offsetting the effect of inflated profits in earlier years.

The current year profit will be inflated by the amount by which SL depreciation falls short of WDV depreciation, assuming that any depreciation surplus for the years prior to the year of change is transferred to a General Reserve.[6] In other words, the current year profits are inflated to the extent of 'Prospective Depreciation Surplus' for the year concerned

Table 1 shows that for 23 companies, the reported profits of Rs 6,857 lakhs were higher than the true or assessed profits by 39 per cent. As a result of this jacking up of profits, the reported and true pay-out ratios were 48 and 79 per cent, respectively. The share of total depreciation surplus (or jacking of profits) among paper and cement companies, and among textile companies were 47 and 44 per cent, respectively. On the other hand, engineering, rubber and chemical companies had very little jacking-up of profits due to depreciation change.

Considering growth and control classification, the share of group companies in the total prospective depreciation surplus was about 79 per cent, and the corresponding share of medium and high growth companies was 55 and 41 per cent, respectively. The true pay-out ratio is relatively high in medium growth companies and group companies as compared to that in other categories. In medium growth companies, the True pay-out ratio of 151 per cent was twice that of Reported Pay-out ratio and in group companies the True ratio of 83 per cent was about 66 per cent more than Reported pay-out. In other cases, the increase in True pay-out was only 50 per cent.

The high depreciation surplus or wide gap between Reported and True pay-out ratio indicates that due to change in depreciation method the depreciation surplus jacked up the Reported profits which influenced the dividend distribution by medium and low growth companies, or group companies, or textiles, engineering, cement and paper companies.

Improvement in Debt Equity Ratio: By following the SL basis of depreciation, the fixed assets are shown at higher value and the reserve position also improves; as a result it increases the firm's capacity to borrow. Leverage—the ratio of debt to net worth—is calculated with net worth based on the SL method (called Reported Leverage), and with net worth based on the WDV method (called True Leverage). Taking the Reported and True average leverages for the period after the year of depreciation change, as shown in Table 1, one may observe that Reported leverage is about 10 per cent lower than True leverage for all industry categories. Leverage—groupwise and growthwise—indicates that the proportionate decrease in Reported leverage is high in group companies as compared to non-group companies, or is high in high and medium growth companies as compared to low growth companies.

The above two points indicate how a change of depreciation method jacks up the profits and reduces leverage.

III

Depreciation Change and Bonus Shares

How far is the depreciation change motivated to issue bonus shares? Does depreciation change enable a company to issue bonus shares?

Issue of bonus shares is the capitalisation of accumulated reserves and is a mere book entry. Issue of bonus shares is regulated by Capital Issue Control Act 1947 to protect the investors against unscrupulous company promoters, to have a balanced growth of industries, and to regulate the capital structure of the companies. With these objectives, every bonus issue must be in conformity with the 'guidelines' for the issue of bonus shares. Of these, two conditions are:

(i) residual reserve after the proposed capitalisation should be at least 33.33 per cent of increase capital after the proposed capitalisation. Upto May 1971, the residual reserve required was 20 per cent of increased paid up capital and development rebate reserve was not allowed to be capitalised.

TABLE 1: PROFITS AND AVERAGE LEVERAGES WITH 'FINANCIAL REPORTED DEPRECIATION' AND 'TAX DEPRECIATION'

(in Rs lakhs)

	Prospective Deprecia-tion Surplus	Total Dividend	Profits		Leverage	
			Reported (SL dep)	True (WDV dep)	Reported	True
Total (23)	2628	3309	6857	4228	1.55	1.7
Textile (12)	1163	1014	2969	1806	1.8	1.98
Engineering (4)	88*	91*	139*	51*	2.71	2.86
Paper and Cement (4)	1226	1996	3046	1821	1.21	1.3
Rubber (2)	103	143	464	361	1.43	1.5
Chemicals	9	66	184	171	1.4	1.41
High Growth (7)	1076	973	3658	2580	1.49	1.67
Medium Growth (10)	1438	2207	2901	1463	1.46	1.6
Low Growth (6)	96*	131**	267**	171**	2.42	2.54
Group (12)	2072***	2632***	5223***	3150***	1.55	1.70
Non-Group (10)	451	556	1381	930	1.46	1.54

Notes: * relates to three companies.
** relates to five companies.
*** relates to eleven companies.
Figures in parentheses indicate number of companies.
Leverage (Reported) = Total Debt/Networth (with SL basis).
Leverage (True) = Total Debt/Networth (with WDV basis).

(ii) 30 per cent of the average pre-tax profits of the company for the previous three years should yield a rate of dividend on the expanded capital base of the company at 9 per cent (earlier 8 per cent) or the average rate of dividend in the preceding three years, whichever is lower.

Verifying these two conditions for the various companies issuing bonus shares in various years, it is observed that companies would not have been allowed to issue bonus shares had they not changed their method of depreciation. By shifting to the SL method of depreciation and crediting the total depreciation surplus to general reserve, the companies could increase their reserves and satisfy the two tests. Under the guidelines, reserves created out of 'genuine' profits or share premium is permitted to be capitalised, but any upward revaluation of assets are not allowed to be capitalised. The question of enquiry is: Should the excess depreciation provided in earlier years be written back and allowed to be capitalised or be taken into account while calculating residual reserves for issue of bonus shares? According to the Department of Company Law Administration there is no legal bar to write back excess depreciation, if Directors view it so. However, it would not be in accord with sound company practice to utilise the excess amount resulting from the recomputation of depreciation for distribution to members by way of dividend or otherwise. They also advised that, it would be appropriate to show the excess amount under a separate head "Reserve not available for distribution in the books" (Company News & Notes, July 1, 1963).

Table 2 gives the list of various companies (fictitious names are given to conceal the identity of the companies) issuing bonus shares. It indicates that the companies used depreciation surplus due to change in method of depreciation—both prospective and retrospective depreciation surplus—as free reserves so as to satisfy residual reserve test. Had there been no change in the depreciation method, in the various companies as given in Table 2, the residual reserves would not have been adequate to satisfy residual reserve criterion.

Similarly, the high pay-out ratio (the ratio of dividend to true profit) and low profit rates indicate that average rate of dividend could not be maintained on increased capital without changing the depreciation method.

Lastly, the issue of bonus shares and change in depreciation method in the same year by a number of companies (particularly when companies reported a fall in profits in the year of bonus issue and depreciation change) may lead one to observe that depreciation change was motivated to enable the company to issue bonus shares.

IV

Review

Let us review the practice of changing depreciation method from the WDV to SL method. Should the companies be allowed to follow the SL method for financial reporting purposes and use the excess depreciation provided in earlier years for declaration of dividend or inflating their earnings?

The corporate financial statements are drawn to reflect economic realities of the situation and supply full information to investors, consumers and bankers, and so depreciation, a charge for use of assets must be adequate. By omission or understatement of depreciation, earnings would be overstated, managements and investors would be misled and there would be a tendency to have a liberal dividend policy by distributing capital in the guise of earnings. Both omission or understatement of depreciation would foster impairment of resources and the difference between the two is only of degree.[7] On the other hand, the decision of management to change the policy of depreciation from excess depreciation to normal depreciation, should not be viewed with suspicion.

In the US, different methods of depreciation are followed for tax and for finance reporting purposes. Survey[8] of Senior Financial Executives of 229 corporations by the Central Board revealed that nearly two out of every three companies use a different method for computing depreciation for tax purposes than they do for financial reporting. About 50 per cent of the corporations surveyed followed the SL method for reporting purposes.

This difference in methods is due to different objectives of tax and financial reporting. For tax purposes, the method giving greatest tax deduction is preferred, while for financial reporting purposes, a method that depreciates assets over the period of benefit and affords a means of identifying specific property with specific values is preferred.[9]

There are different practices and different opinions regarding use of depreciation method for financial and reporting purposes:

Survey by the Conference Board in the US showed that some executives feel that financial statements and tax returns should report depreciation on a consistent basis. The survey quotes treasurer of an aircraft company following double declining method of depreciation for financial, internal reporting and tax purposes as,

> ..I believe that these three reports should always be prepared on the same basis except under extremely unusual circumstances. It has been my experience that problems which arise when using different bases far offset any advantages gained.

Similarly, NAA, Research Report 33 points out that companies followed accelerated depreciation method for reporting purposes, in the light of their expansion programme, as such method provides equally important advantages with respect to financing new facilities, the immediate tax savings and conservation of working capital, allowing companies to reinvest in additional facilities.[10]

On the other hand, survey by the Conference Board indicated that a few companies are contemplating to change the method of depreciation for financial reporting to the SL method as they feel that operations are being unduly penalised with the much heavier depreciation that is reflected by using the sum of the year digits method.

Similarly, NAA Research Report 33 points out that a number of companies continue to employ the SL method of

depreciation for all purposes as they do not need additional funds for replacement, modernisation of expansion and the SL depreciation is thought to be adequate to provide funds for maintaining desired productivity capacity

The following statement by a Financial Analyst in a Symposium on Corporate Financial Reporting cell concludes the differences of opinions.

> I would ask the question of steel companies today. Did they make the change in depreciation and investment credit accounting because they suddenly discovered—all of them at the same time—that a better statement of economic realities comes from their new method of accounting? And if I do not find the answer to be 'yes' then I say; 'For what other reason did they do it?'
>
> In case of some companies when we see one change this year followed by another two years from now, we begin to have a feeling that this is to simply improve the reported earnings.
>
> But I think we must attack each of these changes and find out what are the facts. If it is simply to dress up the earnings, then it does shake your confidence. If it is changing to reflect economic realities, then we say 'Great'!

Relating the above-mentioned observation to depreciation practices of our companies under study subjected to the differences in the technologies of industries in different countries, it can be stated that a switch-over the SL method of depreciation with a view to inflating profit or to camouflage the true financial position in many of the companies was not a healthy step. On the other hand, such a step, because of liberal tax depreciation and with heavy investment programme, was in the interest of the investors and the company. The High Powered Expert Committee on Companies and MRTP Acts (also known as Sachar Committee) is against frequent changes being made by the companies in the method of charging depreciation. The Committee has recommended that a company shall have an option to provide depreciation by any method so long as it writes off 95 per cent of over its prescribed life, and shall not change the method of depreciation without the prior approval of the Central government. The change, according to the committee, shall be allowed only once. The fact thereof shall be shown clearly in the accounts of the year in which such change takes place. To safeguard the interest of investors and others interested in the company, the following steps are suggested:

(i) The change in depreciation method should be with the prior approval of the Central Government, should be once in the life of an asset, and the change should be explicitly stated in the annual report.

(ii) The basis and amount of depreciation for each asset both for financial and for tax purposes be mentioned, and the amount of difference between the WDV depreciation and the SL

TABLE 2: CASES WHERE RESIDUAL TEST OF BONUS ISSUE IS NOT SATISFIED IF THERE IS NO DEPRECIATION CHANGE

(1) ABC and Co No 1	*(Rs lakhs)*			*(Rs lakhs)*
Paid up equity capital		Depreciation Change in 1966:		
as on 31-3-67	23.95	Free reserve as on 31-3-68		21.3
Bonus shares (1:5) 2400		Less depreciation:*		
shares of Rs 200 each	4.8	For previous years	15.23	
		For 1966-67	9.23	24.53
	28.75			−3.23

Reserve less than 20 per cent of increased capital; so Residual Reserve Test *not satisfied.*

(2) ABC and Co No 2	*(Rs lakhs)*			*(Rs lakhs)*
Paid up capital as on		Depreciation change in 1966:		
30-6-66	143.0	General reserve as on 30-6-67		48.94
Bonus shares (1:6) 2.38		Less depreciation*		
lakh shares of Rs 10 each	23.8	For previous years	87.65	
		For 1966-67	124.3	201.95
	166.8			−163.01

Reserve is negative and so *test not satisfied.*

(3) ABC and Co No 3	*(Rs lakhs)*			*(Rs lakhs)*
Equity capital as on		Depreciation change in 1970:		
30-6-70	966.8	Free reserve		699.7
Bonus shares Rs 125		Less depreciation:*		
paid up capital	429.6	For earlier years	733.0	
Other issue	343.6	For 1966-67	299.74	1034.0
	1740.0			−334.3

Since free reserve is negative or less than 20 per cent of increased capital; so *test not satisfied.*

(4) ABC and Co No 4	*(Rs lakhs)*			*(Rs lakhs)*
Paid up capital as on		Depreciation change in 1973:		
30-6-72	149.5	Free reserves as on 30-6-73		91.05
Bonus shares (1:4)	37.4	Add development rebate		
		reserve		65.95
				157.00
		Less depreciation*		
		For previous years	96.5	
		For 1972-73	89.83	186.33
	186.9			—29.33

Reserve is negative *Test not satisfied.*

Notes: *Depreciation indicates the amount of excess of WDV depreciation over SL depreciation credited to General Reserve.

depreciation be shown in the annual report of the company.

(iii) The change should not be made to declare cash dividend or stock dividend. Depreciation surplus or accumulated depreciation surplus should not be utilised to be capitalised or be utilised to compute residual reserves for issue of bonus shares.

(iv) Clause 3(xv) of Part II of Schedule VI to the Companies Act provides that "the amount if material by which any item shown in the profit and loss account is affected by any change in the basis of accounting, shall be spelled out". The statement on auditing practices issued by the Institute of Chartered Accountants of India also provides that "any change in the basis of providing depreciation from year to year amounts to a change in the method of accounting, the result of which in terms of profit should be disclosed by way of a note to the profit and loss account, if material". Our analysis shows that only in a very few cases, such note is given by the auditor specifying the amount involved, when in a number of cases the amount involved is quite large. Recently the Government has laid down in June 1977 an additional guideline for the issue of bonus shares. According to this guideline in case of a change in the method of depreciation, the companies should ensure that adequate provision for deferred taxation liability is made and the auditor's certificate to this effect should be furnished along with the application of bonus issue. No doubt, a number of companies even at present mention in their balance sheet the effect of change of depreciation method on tax liability, but in the interests of shareholders and investors, any change in profit due to change in depreciation method should be spelled out in the profit and loss account.

V

Summary and Conclusions

The change in depreciation method from the written down value to straight line was found to inflate profits by 39 per cent and to improve the debt-equity ratio by about 10 per cent. This practice of depreciation change was found among textile, engineering and other industries. Most of these companies were group companies indicating the intention to draw out funds as early as possible. The low growth companies changed their depreciation method to jack up profits and to camouflage the true financial position, while high growth companies changed their depreciation method to even out the burden of depreciation throughout the life of the assets. Depreciation change was also used to enable companies to issue bonus shares and to declare cash dividend. Had the depreciation change not been resorted to, number of companies could not have been able to issue bonus shares.

Thus the practice of depreciation change, if followed to rectify the earlier practice of providing high depreciation or if followed in the interest of the company, is a good step. On the other hand, if it is done, as found in most of the companies, to dress up earnings and declare dividend, it is not a step in the interest of the company or financial institutions or the economy, and it therefore needs to be checked.

Notes

[The author is grateful to SC Kuchhal, Suresh A Seshan, and Paul Mampilly, for their guidance in carrying out this study and also for their comments on the earlier draft.]

1 Before the assessment year 1940-41, depreciation on fixed assets was provided on straight line method.

2 For financial reporting purposes, Companies Act 1956 made it compulsory to provide depreciation so that balance sheet and profit and loss account exhibit a 'true and fair' state of affair of business. However, the Companies Act Amendment in 1960 gave an option in methods of depreciation for reporting purposes.

3 The amount of depreciation on the SL (Financial Reporting) method and the WDV (Tax Depreciation) method are drawn from Income Statement and *Statement of Managerial Remuneration* respectively. In cases where managerial remuneration computation is not given in the Annual Report due to inadequate profit or losses, tax depreciation is computed on the written down value of assets immediately prior to the year of change of depreciation method, at the depreciation rates given in the Income Tax Rules. Any biasness in such computation due to subjectivity of depreciation rates or the amount of WDV is of marginal significance as such cases are very few.

4 The companies have been classified according to control, size and growth on the following basis:

Control Classification: Companies belonging to large or larger business groups given by Licensing Enquiry Committee Report 1969 are called 'Group' companies and others not belonging to such business groups are called 'non-group' companies.

Size Classification: Size classification is done on the basis of total assets as under: Small—total assets less than Rs 2.5 crores. Medium—Between Rs 2.5 and 5 crores. Large—Rs 5 crores to 10 crores. Largest—above Rs 10 crores.

Growth Classification: Companies have been classified on the basis of their compound rate of growth in total assets and their earning rate as follows:

High Growth: Growth rate of above 10 per cent and earning rate of above 12 per cent.

Medium Growth: Growth rate between 5 and 10 per cent with earning rate above 10 per cent.

Low Growth: Other cases not covered in above two growth classes.

THE SEA CHANGE!

Yes it's a total transformation that is in store for Cochin.

Behind the great transformation is the Greater Cochin Development Authority

Greater Cochin Development Authority has envisaged 40 detailed town planning schemes that will give Cochin a new look, a new identity.

Housing schemes to suit people from all walks of life...at Panampilli Nagar, Gandhinagar, Kaloor, Rameswaram, Koovappadam, Mamangalam, Parur, Vaduthala..

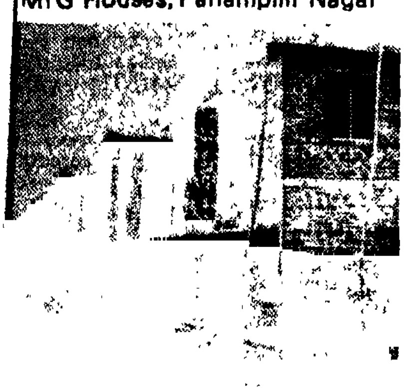
Slum improvement schemes at Fort Cochin, Mattancherry, Elamkulam..

Shopping Centres at Panampilli Nagar and Gandhinagar

Mini Stadium, with the highest pavilion in Kerala at the Maharajas College Grounds...

Rajendra Maidan Open Air Auditorium at Ernakulam...

Changampuzha Cultural Centre at Edappally in memory of the late great poet Changampuzha Krishna Pillai of Kerala...



Subhas Park with all modern amenities..

And the pride of tomorrows' Cochin— the Marine Drive Scheme—a complex of flats, shopping arcades, cinemas...

Come participate in the sea change that is coming over Cochin.

Towards a Greater Cochin- Greater in everyway!

MIG Houses, Panampilli Nagar

Inflation Accounting: Some Recent Developments

Ramesh Gupta

With the rejection of Exposure Draft No 18 (ED-18) on July 6, 1977, the continuing battle over the precise methods of 'Inflation Accounting' seems to have come to a standstill; whereas the UK accounting profession is living with "An Interim Recommendation", the US, through its Security Exchanges Commission requirements, is content with disclosure of fragmented and piecemeal information about replacement cost.

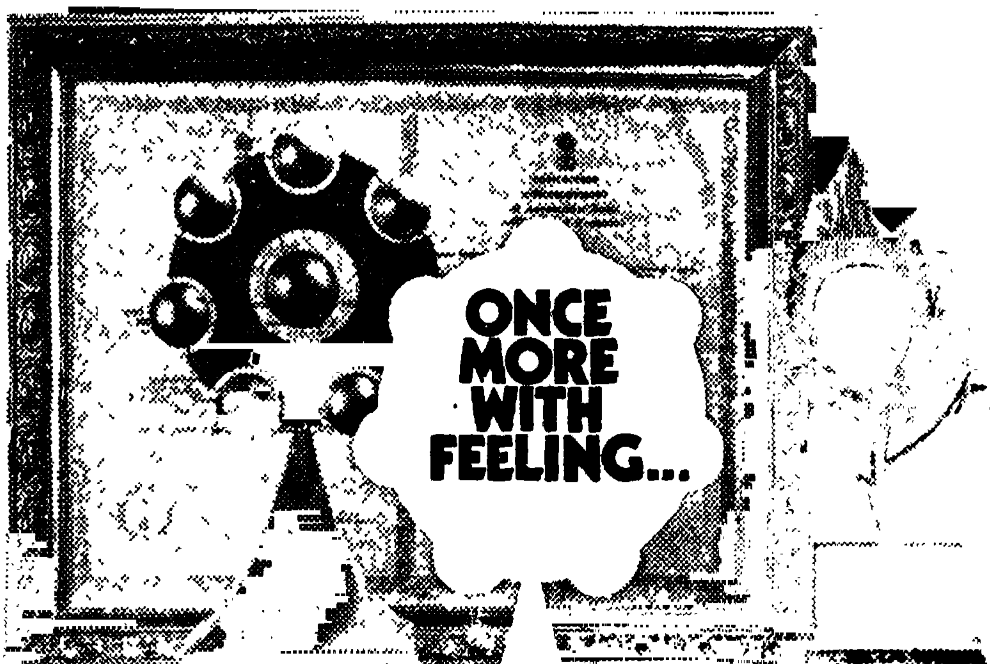
This paper seeks to examine and review critically the various stages in the development of the concepts and practices of accounting for changing prices. It concludes with a case study of the managerial uses, by an Indian firm, of one of the suggested inflation-adjustments methods.

I
Historical Developments

ACCOUNTING for inflation first became a subject for serious debate as a potential practical proposition in the early 1950s. The efforts did not go too far, because the inflation rate was not high enough to warrant any change in traditionally established and generally accepted accounting principles. However, the markedly sharper twist to the inflationary spiral during 1970s has alarmed the businessmen to concentrate on the problem of financing industrial plant replacement and the drain on working capital resources brought about as a consequence and aggravated by the level of taxation on corporate profits.

In June 1969, the Accounting Principles Board of the American Institute of Certified Public Accountants (AICPA) issued Statement No 3, 'Financial Statements Restated for General Price-Level Changes'. This document is an extension and improvement of Accounting Research Study No 6 issued by the AICPA in 1963 titled 'Reporting the Financial Effects of Price-Level Changes'. In January 1973 the Institute of Chartered Accountants in England and Wales published 'Accounting for Inflation — A Working Guide to the Accounting Procedures" as a companion to the Exposure Draft (ED-8) on 'Accounting for Changes in the Purchasing Power of Money' issued by the Accounting Standards Steering Committee (ASSC).

ED-8 proposed adoption of a method of adjusting published company accounts by reference to an appropriate index that would measure the degree of fall in the purchasing power of the monetary unit and enable comparisons to be made with the historic cost figures used in the statutory accounts of the organisation.



The Exposure Draft (ED-8) was debated at length and in May 1974 it was followed by ASSC's 'Statement of the Standard Accounting Practice' (SSAP), No 7 in a series of such SSAPs This document, provisional in its nature, requires the quoted companies to provide inflation adjusted accounts as a supplement to the statutory accounts prepared under historic cost conventions. In January 1974 during the discussion period of ED-8, the government set up the Independent Committee of Inquiry into Inflation Accounting to look into all aspects of the problems of accounting for price changes The committee chaired by Francis Sandilands submitted its report in September 1975.

The Sandilands Report took a different view to the ASSC on the most appropriate method of inflation accounting and it came down in favour of 'Current Cost Accounting' (CCA), as opposed to the 'Current Purchasing Power' (CPP) method which formed the basis of the ASSC's SSAP No 7. The two systems are based on fundamentally different concepts. Under CPP, all the items in the financial statements are presented in a unit of measurement that represents the same amount of general purchasing power — the general purchasing power of monetary unit on balance sheet date. It also recognises the general price-level gains and losses that result from holding monetary assets and liabilities during inflation or deflation. Barring these two changes, the financial statements prepared under CPP method suggested by SSAP 7 are similar to the conventional statements based on historic costs CPP preserves the cost basis and the realisation rule of historic costs conventions In contrast to the CPP approach to inflation accounting of adjusting the historic cost accounts by reference to an index of the purchasing power of the currency, the CCA system as recommended by Sandilands adopts the concept of revaluing physical assets such as building, plant and machinery at their "value to the business". This principle has now been enshrined in the Exposure Draft (ED-18) prepared by the Inflation Accounting Steering Group (IASG) under the chairmanship of Douglas Morpeth. We will come back to it later.

Current Cost Accounting in US

On the other side of the Atlantic in the US, in 1974 the Financial Accounting Standards Board (FASB), a successor to Accounting Principles Board of AICPA, issued a proposed statement of Financial Accounting Standard that would require, for fiscal years beginning on or after January 1, 1976 the restatement of conventional financial statements for changes in the general purchasing power of the monetary unit and the reporting of certain information from adjusted statements. Their statement is formally known as "Financial Reporting in Units of General Purchasing Power". Later in August 1975, the US Securities and Exchange Commission (SEC) asked for comments on proposed disclosure requirements which would require corporations to measure and report the current replacement cost of certain assets. In March 1976 these requirements were made mandatory for approximately 1,000 of the largest US manufacturing corporations. In a release — Accounting Series Release No 190 dated March 23, 1976 — the SEC stated that the purposes of the required disclosure of current replacement cost information were "to provide information to investors which will assist them in obtaining an understanding of the current costs of operating the business . (and) to provide information which will enable investors to determine the current cost of inventories and productive capacity as a measure of the current economic investment in these assets "

On March 31, 1977 many of the United States' largest public companies

ONCE
MORE
WITH
FEELING...

filed with the Securities and Exchange Commission their first annual reports containing the disclosures required by the Commission's controversial replacement-cost rule. In a study made by Arthur Young (a prominent CPA firm in the US), summarising the results of 175 companies which disclosed the data by the time of study, the current cost of replacing gross productive capacity was, on average, about two times the original cost; net productive capacity was from two-thirds to three-fourths higher on a replacement cost basis; and current-cost depreciation expense averaged two-thirds more than historical-cost depreciation expense. However, the degree to which replacement costs exceeded historical costs varied widely among the companies included in the study. The ratio of replacement cost to historical cost of inventories varied significantly, depending on whether the FIFO or LIFO method was used in preparing financial statements and whether additional replacement cost depreciation was included in estimating the replacement cost of inventories.

The SEC has decided to continue with its replacement cost disclosure rule for the time being. On August 5, 1977, it issued a release confirming that it would again require replacement cost data for the current year. Meanwhile, to assist Financial Accounting Standard Board (FASB), the rule-making body for the US accountants, in its efforts to develop a conceptual framework of accounting and reporting, the American Institute of Certified Public Accountants has set up a task force to study the various proposals of concept and measurement and to encourage experimentation with a minimum number of financial accounting models formulated from various alternative measurement methods which have been proposed. US business executives, CPAs and regulators are also monitoring the latest British move. Thus, the FASB is in the throes of its own inflation accounting debate, and what others, particularly the British, do cannot help but affect the FASB deliberations.

Developments since Sandilands

Before considering the content of ED-18, let us review developments since the Sandilands report was published in September 1975.

In November 1975, the CCAB (Consultative Committee of Accountancy Bodies, the six British professional bodies which sponsor the ASC) issued its "initial reactions" to the Sandilands Report. Although welcoming the report as a valuable contribution to accounting thoughts, the CCAB said that CCA did not deal with changing value of money. Earlier ASSC in its publication "The Corporate Report" also insisted that a current value accounting must take account of the changing value of money. The problems of making valid comparisons over a period of time when the unit of measurement is unstable is not dealt in Sandilands report.

Later in the same month, the British government adopted the Sandilands Committee's proposals, and Douglas Morpeth was appointed chairman of the Inflation Accounting Steering Group (IASG). In the words of Westwick, a member of the committee, "our task was to convert the proposals of the Sandilands Committee on current cost accounting into a draft accounting standard which would be practical, acceptable and auditable". The IASG was told to prepare a proposal for an exposure draft on CCA after taking into account the initial reactions of CCAB as well as comments made by others. The proposed exposure draft was submitted to the ASC early in September 1976, and after intensive discussion and modification, was published two months later as ED-18.

Profit Measurement and Maintenance of Capital

One of the problems that is central to inflation accounting, and indeed to all accounting, is the definition of profit. In measuring profit, we are trying to determine if a firm has been able to maintain its capital, so that the firm may retain its 'welloffness' as it existed at the beginning of the period. The accounting aspect of capital maintenance has been under serious discussion at least since the pioneering work of Henry W Sweeney in the 1920s and early 1930s. Under historical cost accounting profit is what is left-over after maintaining the money value of capital. This is the 'legal' view embodied in conventional accounting practice. Under current purchasing power (CPP) method, it is what is left-over after maintaining the purchasing power of capital. It maintains the 'exchangeability' of the capital committed to the accounting entity by its shareholders. Under Sandilands' current cost accounting (CCA), the emphasis is on maintaining the actual physical material capital. The profits are calculated after charging against revenue the current value of the physical assets consumed during the year. The ED-18 accepts this view in calculating 'current cost profits' in the profit and loss account. In ED-18, the amount available for 'distribution and general reserve' is the sum of current cost profit for the year and the surplus on revaluation of assets during the year, less the amount appropriated to revaluation reserve by the directors. The amount to be appropriated is a discretionary sum to be decided by the directors based on what they consider 'substance of the business' to be maintained. Should this substance be maintained in money terms or general purchasing power terms or specific power terms is for them to decide.

II

Major Provisions of ED-18

Under ED-18 the limitations of historical cost accounting under inflationary conditions are to be corrected in the following manner:

(1) Depreciation and cost of sales for the year is to be calculated on 'value to the business' of these assets, and not on their original cost. Thus, calculation of profits is based on *current cost of assets* consumed during the year.
(2) The balance sheet will show current values for most assets and will no longer show their historic cost. The current cost is based on the 'deprival value' of an asset.
(3) There will be a new statement in the annual accounts — the appropriation account — in which there will be brought together the current cost profit, the revaluation surpluses, the amount which the directors consider should be retained within the business having regard to their assessment of its needs, and dividends. Directors may transfer from this surplus to a capital maintenance reserve, amounts required to maintain the 'substance of the business'
(4) There will be a note to the accounts entitled 'The Statement of the Change in the Equity Interest after Allowing for Changes in the Value of Money' The statement will clearly show how the company has performed in relation to the rate of inflation and will also show its losses or gains from the holding of monetary items

It is hoped (vide para 5 of the report) that CCA will provide management, and the users of published accounts, with more realistic information on costs, profits, and value of assets, and the return on capital and on assets. It also provides a distinction between the profits earned from the operations of the business and the money gains resulting from changes in the price of a company's assets. Vide para 6, annual accounts prepared and presented on the basis set out in this draft should contain a profit and loss account, an appro-

priation account and a balance sheet. Except for wholly-owned subsidiaries there should be included in the notes to the accounts a statement of the change in shareholders' net equity interest after allowing for the change in the value of money.

In profit and loss account, the operating profit or loss is arrived at after charging depreciation and the cost of sales on the basis of current 'value to the business' of the physical assets consumed during the year. The guideline to determine the value to the business of different assets in the balance sheet is as follows.

Plant and Machinery: Plant and machinery in the balance sheet will be shown at their 'value to the business'. This will be their net replacement cost except where this is greater than both the economic value (which is, the present value of the income that will be earned from using the machine during the rest of its life) and the net realisable value in which case it will be the higher of the economic value and net realisable value.

The general rule of ED-18 is that the 'value to the business' is its 'deprival value' that is, the maximum loss accruing to the firm if it were to be deprived of its assets. This deprival value will depend upon the intentions of the firm with respect to its assets. The firm can replace it, sell it or hold it. In each situation, net replacement cost, net realisable value and economic value respectively becomes relevant. Depending on the circumstances, economic value or net realisable value could be the appropriate value to the business. For example, if asset's net replacement cost was Rs 10,000, and if the present value of the net income that will be earned from using the machine during the rest of its life is only Rs 8,000, then the firm would not seek to replace it. Although economic value and net realisable value are possible bases for value to the business, the ED-18 Guidance Manual stresses that in most situations the most appropriate value to the business will be net replacement cost. Sandilands report also supports this view.

Technological Change and the Use of Indices: The gross current cost of plant and machinery is the cost to be incurred to obtain and install a substantially identical replacement or the cost of modern equipment in case technological changes have taken place, whichever is lower. The value of the assets that the company has gets affected by the existence on the market of new, improved asset. The Sandilands report favoured the use of industry-wise indices in determining the value to the business of plant and machinery. Sandilands implied that such indices incorporate the effects of technological change, whereas in fact they are constructed to eliminate such effects. Sandilands' reliance on the use of official indices, while giving the impression of uniformity and accuracy, could in many cases be misleading. ED-18 recognises this, and it sensibly expresses a preference for asset-based indices rather than industry-based indices.

However, ED-18 introduces a considerable degree of subjectivity into fixed assets valuation by the way in which it recommends that if technological improvements reduce asset costs this should be reflected in the current cost of the asset. In doing so, the estimated cost of the 'modern equivalent asset' which would be deemed to replace the asset now owned by the firm, is to be adjusted to take account of (a) the present value of estimated differences in future operating costs, (b) differences in output capacity, and (c) the estimated life of the improved machine over a substantially identical replacement.

Where the gross current replacement cost of plant and machinery is estimated, by reference to the cost of a substantially identical asset, that cost should be calculated by reference to one or more of the following sources of data:

(a) Suppliers' official price lists, catalogues, etc, with appropriate deductions for the trade discounts.
(b) The company's own replacement cost estimates based on expert opinion.
(c) An index compiled by the Company from its own purchasing experiences.
(d) Authorised external price indices analysed by asset type.
(e) Authorised external price indices analysed by using industry.

It is envisaged that most companies will use a combination of methods, using the methods higher in the list for the more important and more expensive items of equipment, and the methods lower in the list for the less expensive and less important items of plant and machinery.

In the United States, where the FASB and the SEC are moving much more cautiously in introducing current value accounting, the expected difficulties likely to be associated with accounting for technological change are already receiving attention. The SEC Accounting Series Release No 190 (issued in 1976) requires only to disclose the estimated cost of stocks and of fixed assets in corporate annual reports. There is yet no requirement for replacement cost figures to be incorporated in income measurement, but an editorial in *Business Week* (August 9, 1976, p 80) commented on such possibility in the following words:

> In a world of rapidly changing technology no one replaces old equipment with an exact duplicate. Replacement will take the form of new machinery that costs more but produces more efficiently. And so, to calculate earnings on a replacement cost basis, accountants must not only charge more depreciation, they must also adjust for differences in output and operating costs. When they have done so, they wind up in a curious dream world where companies substract savings they did not realise from costs they did not incur to derive earnings they did not make.

Recognition of technological change in the manner proposed by ED-18 not only leads to subjectivity of assets valuations, it also raises the important theoretical issue as to whether resultant depreciation charges are in fact a measure of the current value of the costs actually incurred by the enterprise in the current period, or whether they entail an unwarranted anticipation of possible future cost saving.

Land and Building: Like plant and machinery, the land and buildings are to be carried at their 'value to the business' which in owner occupation will normally be their open market value for their existing use, plus estimated attributable acquisition costs. Open market values are to be supplied to the company by professionally qualified surveyors.

Professional valuations are to be carried out at least every five years unless there has been a substantial change in the market in that period. If such valuation cannot be made, the value to the business should be the total of the depreciated replacement cost of the buildings and the open market value plus estimated attributable acquisition costs of the bare land for its existing use. If economic value of such land and buildings is smaller than the value estimated as above, then the economic value would be the value to the business.

Depreciation: The charge to the profit and loss account for depreciation should be equal to the value to the business of the assets consumed during the period. Since, when assets are valued on the basis of their net current replacement cost, the value consumed increases as the replacement cost of the assets increases, the charge may be based on average value for the period. The charge is obtained by apportioning the asset's average value over a period equal to the expected remaining useful life of the assets at the beginning of the period.

The selection of the average asset value for computing depreciation is a departure from the recommended use of the end-year value by Sandilands Committee.

In times of rising prices, the amounts charged to the profit and loss account will not be sufficient to accumulate a

total provision for depreciation equal to the asset's gross current replacement cost at the end of its useful working life. The accumulated depreciation at the beginning of each year and the charge for depreciation for the year are both likely to be based on values which are lower than the value at the end of the year. The sum of the accumulated depreciation brought forward and the charge for the year will, therefore, not equal the accumulated depreciation required at the end of the year. The shortfall is called 'backlog depreciation'.

In using average value for charging depreciation, there will be two elements of backlog depreciation. One, prior-year backlog depreciation—the amount of additional accumulated depreciation required to keep the accumulated depreciation account in the same proportion as over the year the replacement cost has increased. Second, current year backlog depreciation—the amount needed to uplift the annual charge based on the average depreciable value to the depreciation charge really needed to cover the replacement cost at year-end.

Para 11 of ED-18 suggests that backlog depreciation should be charged against the related revaluation surpluses, rather than to the profit and loss account.

Inventories: Inventories are to be stated at the total of the 'value to the business' of the separate items of inventory, or of groups of similar items. This will generally be lower of replacement cost and net realisable value. The current replacement cost of stock and work-in-progress should include the cost of purchased items, together with the cost of manufacturing, processing and other expenses incurred in bringing the product to its present location and condition. This should include all related production overheads even though they accrue on a time basis.

The general principles in relation to stock and work-in-progress stated in ED-18 follow closely the recommendations made in the Sandilands report. One difference however is that ED-18 proposes that stock and work-in-progress be shown in the balance sheet at its 'value to the business', while Sandilands recommended such value to be shown only by way of a note.

The sources of data used in the calculation of the current replacement cost of stock, and the current cost of sales are in descending order of preferences as shown below (vide para 164).

(1) The costs currently being incurred by the company at the date of consumption for various cost elements.
(2) Suppliers' official price lists, catalogue, etc, in respect of purchased items with appropriate deductions for trade discounts.
(3) An in-house index compiled by the company from information on its own costs of purchases, labour and overheads.
(4) An authorised external price index for the costs of each type of stock used by the company, or for the costs of stocks of companies in the relevant industrial category.

The ED-18 does not prescribe any particular method to be employed to determine the current replacement cost; each company will need to develop the techniques appropriate to their business.

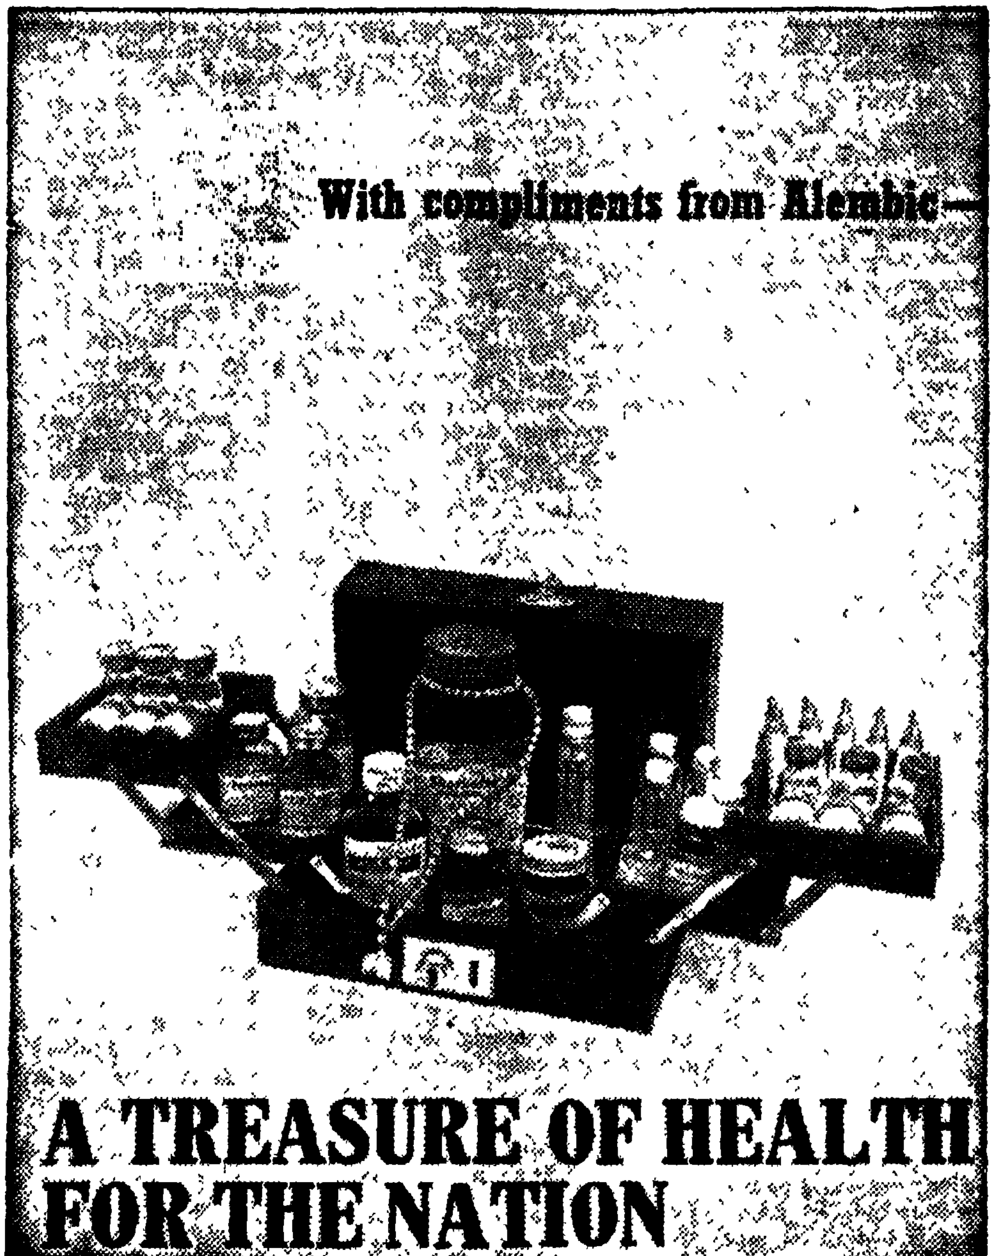
Cost of Sales: Para 15 states that "the amount charged to the profit and loss account for the period for stock and work-in-progress consumed should be the value to the business, at the date of consumption, of the stock and work-in-progress consumed during the period". The calculated cost of sales adjustment (COSA) would be added to or, where appropriate, deducted from the cost of sales charged to the profit and loss account for the period and included as part of the surplus or deficit arising on revaluation of stock.

The ideal would be to determine current cost of sales on an item by item basis, but it may be impractical. Generally, companies calculate cost of sales on a periodic basis. If a company has a fairly regular sales pattern and if prices have increased steadily during the period, ED-18 has recommended *averaging method* for calculation of the current cost of sales. The objective of averaging method is to charge stock consumed at the average current cost during the period.

Further, a number of circumstances have been listed in which it will not be necessary for companies to make cost of sales adjustment. These are:

(a) Work-in-progress which is being carried out as part of a contract, including stocks of materials ordered for a particular contract, and finished products not yet delivered.
(b) Assets which were purchased solely with a view to gaining the benefit of an increase in their market value, e g, the stock of a commodity dealer.
(c) Stocks which were increased significantly in order to avoid increase in price.
(d) Stocks which were purchased substantially below (or above) the market price.
(e) Seasonal agricultural products.

Contract Work-in-Progress: The most important of these exemptions where COSA is not required is contract work-in-progress. Morpeth Committee recommended that once a material had been allocated to a specific contract no further adjustment for increase in its cost should be made. This may appear to be a divergence from the strict theory of CCA. However, when allocated to a contract, materials cease to be part of general trading stock of the company and it is appropriate to provide for their replacement by charging to the contract their replacement cost at the date of such allocation.



Another problem for contract work-in-progress is the question of financing of the cost of the contract by means of progress payments. Morpeth Committee decided that work-in-progress for a specific customer, less progress payments on this account, is more in the nature of a monetary asset than a physical asset and, therefore, needs no adjustment in cost of sales.

Gains due to Skilled Buying: One of the criticisms that was made of the Sandilands proposals is that the results of skilled buying would be shown as holding gain, whereas the results of skilled selling would be shown in the profit and loss account. Morpeth Committee has proposed that any profits made from skilled buying: (a) when a company make a significant departure from its normal buying pattern by purchasing stock in advance of normal requirements in order to avoid an expected increase in price, or (b) when stock is purchased at a price substantially below the relevant market buying price at the date of purchase, should be included in the profit and loss account and not in the appropriation account.

Capital-based Government Grants: An aspect of valuation not covered in the Sandilands report is the treatment of government grants. According to ED-18 (para 48), in arriving at a replacement cost of assets, the grant receivable from the government should be deducted from the gross current replacement cost as it is only the net outlay that the company would have to bear. Although this treatment is consistent with the theory of value to the business, it does have a rather odd consequence in that if the rate of grant falls, the 'value' of the asset will increase and the company will therefore show a holding gain.

Intangibles: In dealing with the valuation of intangibles ED-18 makes proposals which are both subjective and illogical.

In the case of goodwill only purchased goodwill is continued to be shown in the balance sheet at cost less amount written off. Such value at the time of purchase is to be determined by valuing the net assets acquired "at their value to the acquiring entity according to the principles of CCA". In order to avoid introducing "too great a degree

With compliments from Alembic—
A TREASURE OF HEALTH
FOR THE NATION

of subjective judgment into the preparation of balance sheet", it is recommended that no account should be taken either of any subsequent increase in the value of purchased goodwill or of any internally generated goodwill. ED-18 is also indifferent as to whether the every year write-off goodwill is to be made to the profit and loss account or to the appropriation account.

Not only does this introduce confusion into the problem of income measurement, it is also inconsistent with the proposed treatment of other intangibles.

All other intangibles (including research and development expenditure) are to be recorded in the balance sheet at their current value, if such value can be established. If value to the business cannot be established the intangibles are to be written off in the profit and loss account. Such intangibles are not to be shown at their historical cost figure, since this figure "may bear no relationship to the current value".

It is difficult to understand why, ED-18 is so selective in its disapproval of subjective estimates in case of goodwill and of the use of historical cost as a proxy for current value where the latter is indeterminant.

Trade Investment: ED-18 draws no distinction between those held as current or as long-term assets. Quoted investments should be valued at their mid-market price (the average between 'bid' and 'asked'). Unquoted should be stated at their value to the business as determined by the directors; this would normally be related to (a) the net asset value to the company on a CCA basis; and/or (b) the present value of the expected stream of income from investment.

Investment in associated companies are to be shown at the applicable proportion of their net assets as shown by their CCA accounts. However, where the associated company is a quoted company, the investment may be valued at their mid-market value.

Liabilities and Deferred Tax: Deferred tax should be accounted for on the liability method in respect of all timing differences "other than any tax reduction which can be seen with *reasonable probability* to continue for the foreseeable future, either by reason of recurring or continuing timing differences or in the case of revalued assets by the continuing use of the assets or the postponement of liability on their sale". The potential deferred tax liability for all timing differences should be disclosed in a note.

Liabilities other than deferred tax should normally be shown at their face value. Discounting or the use of market values is not to be permitted. In case of quoted securities mid-market price at the balance sheet date should be shown by way of a note to the accounts.

The Exposure Draft introduces wide variations and inconsistencies into the use of market values and discounting in making valuations. Neither can be used for liabilities (even for quoted debentures, etc) except that a new kind of discounting (involving a notion of reasonable probability) is introduced into deferred tax accounting.

If quoted market values are to be used under ED-18 to produce current valuations of investments (vide para 63) and if discounting is acceptable in determining economic value and in valuing the impact of technological change on the value of plant and machinery, it is difficult to understand why the use of either basis is rejected in arriving at a valuation for liabilities. It is difficult to see what logical justification there is for excluding the use of discounting technique in valuing liabilities. Can it not be concluded that expediency rather than principle governed the decision to use 'reasonable probability' (discounting having been rejected) in dealing with the problem of deferred taxation?

The Appropriation Account: Under ED-18 the figure of current cost profit in the profit and loss account is the same as recommended by Sandilands report. Current cost profit is what is left over after charging against revenue the current value of the physical assets consumed during the year. One of the most significant and controversial departures which ED-18 makes from the recommendations of Sandilands comes

Appendix

SPECIMEN COMPUTATION OF INFLATION CHARGE

For fixed assets, the practice is to compute replacement values using inflation indices applicable to buildings and plant. These indices are cleared with the Chief Engineer of the company and reference is made to economic journals and Reserve Bank bulletins to decide on the index. In the computation of trading profit statistical depreciation on replacement value is calculated and, therefore, the charge to results includes the provision necessary for inflation in replacement of fixed assets.

For working capital, the procedure is to estimate the gross working capital at the end of the year and this is reduced to the extent of estimated bank borrowing, long term loans, provisions for taxation, etc. The difference gives you the uncovered working capital which is supposed to be financed from company's past and current year's retained profits. The assumed rate of inflation for the following year is applied to the uncovered working capital amount to arrive at the net inflation charge. This amount represents additional finance necessary to be found from within the business for maintaining the substance of the business. However, the amount needs to be grossed up at the applicable effective tax rate of the company to arrive at the gross inflation charge. This is essential as the company needs to earn that much extra pre-tax profit to be able to finance the additional net working capital necessary to cope with inflation. To this gross amount is also added all interest payment on short term and long term loans which is in excess of 6 per cent. The excess interest over 6 per cent is considered of inflationary nature and therefore added to the gross inflation charge. Since interest is a tax deductable expense in the company assessment it is not necessary to gross up the element of excess interest. The computation is done as under:

		Rupees Thousands
Gross working capital (stocks plus debtors less creditors) at end year		
Less:		
Bank Overdrafts	( )	
Long term loans	( )	
Tax Provisions	( )	
Deferred Dividends	( )	( )
Uncovered Working Capital		———
Inflation charge @ X per cent		———
Grossed up for tax		———
Add interest above 6 per cent		———
Total inflation charge		———

The total company inflation charge is allocated to the product groups in the ratio of average working capital employed by them.

in the form of an appropriation account. The appropriation account should show (i) the current cost profits or loss for the year; (ii) the surpluses or deficit for the year arising from the revaluation of assets; (iii) the amount appropriated by directors to or from revaluation reserve; (iv) dividend distribution; and (v) balance being transferred to general reserve.

It is envisaged that, in deciding what amount to appropriate, the directors will have regard to two matters :

> What is the 'substance of the business' that they consider should be maintained (is it the physical assets, or all the assets, or the long-term capital, or the owners' capital, etc)?
> Should this substance be maintained in money terms, general purchasing power terms, or specific price terms?

Such transfer to revaluation reserve account is left at the discretion of directors. Sandilands was uncompromising in his refusal to allow any holding gains resulting from the revaluation of assets to be treated as part of distributable income. ED-18, on the other hand, recognises a number of situations which may lead the directors to appropriate more or less than the amount of revaluation surpluses. It suggests that appropriation to revaluation reserve in excess of holding gains may be necessary to provide for such items as backlog depreciation, the amount required to finance an increased volume of trade debtors, and stock as a result of inflation; or even an amount to maintain the purchasing power of stockholders' equity.

Directors also have discretion to provide less than revaluation surpluses, that is, to treat part of holding gains as distributable profits. ED-18 provides that, in general, holding gains are to be treated as capital. There are, however, three situations in which it is specified that holding gains should be treated as income. These are : (a) where the asset was purchased or held 'solely' with a view to gaining the benefit of an increase in its market value (the main example being in investment and commodity dealing activities); (b) where usually large purchases are made in anticipation of future price increases; and (c) where stock is purchased at a price substantially different from "the relevant buying price at the date of purchase".

Thus ED-18 blurs the whole concept of profit. The distinctions between capital and revenue charges are of arbitrary nature. This makes it all the more important for the profession to sharpen up its conceptual thinking on the question of what it means by 'profit'.

Change in Net Equity Interest: The decision by the Sandilands Committee to recommend current cost accounting (CCA) rather than the current purchasing power (CPP) basis advocated by the Accounting Standards Steering Committee in its earlier statement of Standard Accounting Practice No 7 has undoubtedly tended to confuse many people who were already bemused by the whole controversy. By recommending current cost profits on replacement cost basis ED-18 seems to be wholly consistent with Sandilands recommendation. However, the most heated argument in recent years within the area of inflation accounting has been over the treatment of the maintenance of purchasing power of the equity interest and also over the gain or loss resulting from monetary items. One may recall the controversy followed by the publication of Sandilands report, in which ASSC insisted that a current value accounting must take account of the changing value of money. This reaction found favour with ED-18 and a statement by way of notes to accounts has been recommended.

This "Statement of the Change in

Shareholders' Net Equity Interest after allowing for the Change in the Value of Money" shows whether the shareholders' net equity interest, value both at the beginning and end of the year in CCA terms, has been maintained in real terms. This statement converts the shareholders' net equity interest at the beginning of the year into uniform purchasing power units based on Retail Price Index (RPI) at the end of the year. This figure then is compared with net equity interest at the end of the year based on current cost accounts; so a comparison can be made whether shareholders' have been able to maintain the purchasing power of their interest in the company against the vagaries of inflation.

Also to be found in the notes to the accounts will be amount of gain or loss to the company as result of owing monetary liabilities or holding monetary assets It can be observed, in the words of Westwick, a member of the Morpeth Committee, "that the Steering Group decided to put the items about which there was the greatest measure of agreement, namely depreciation and cost of sales on a CCA basis into the profit and loss account. Those items about which there was still some controversy have been dealt with as non-mandatory transfers within the appropriation account, and finally those items which are the most controversial are to be shown as notes to the accounts."

Auditing Current Values: One of the most important criticisms of the CCA method as proposed in ED-18 is that in determining the value to the business of the fixed assets such as building, plant and machinery, reliance will have to be placed to a considerable degree on the subjective judgment of officers of the company and on the opinions of professional valuers who may be called in. It can be seen that ED-18 will make life much more difficult for auditors and will greatly increase the subjectivity of accounting measurement and scope for errors therein. And then, there are conceptual problems with regard to concept of profit and capital. It is evident that the more we blur the distinction between profit and capital, and between capital charges and revenue charges, the more scope we shall be giving to management to indulge in what Americans have stigmatised as 'imaginative accounting' on the lines of "Unaccountable Accounting", by Briloff (Harper and Row, New York, 1972).

Post ED-18 Developments: To the surprise of most, ED-18 was rejected by a majority of British Chartered Accountants on July 6, 1977. One of the accountants' chief criticism of both Sandilands and Morpeth was that they focused on adjustments to physical assets and ignored the effects of inflation on monetary assets and liabilities. If a company holds net monetary liabilities, the argument runs, a company gains purchasing power during inflation because it will be able to pay off its liabilities in cheaper pounds or rupees. One can make a similar argument for replacement calculations. To the extent that higher replacement-based cost of sales and depreciation can be financed by debt, there is no real replacement problem.

The Consultative Committee of Accounting Bodies (CCAB), on rejection of ED-18, appointed Hyde Committee (headed by William Hyde, Chief Accountant of Oxford University) to 'come up with a quick solution so that investors would have access to some kind of information of inflation adjusted data. The committee's report known as "An Interim Recommendation" dated 4th November has been adopted by Accounting Standards Committee (ASC). The 'Interim Recommendation' is a short and fairly simple statement. It leaves balance sheet values untouched, and recommends only adjustment to income. The information is to be inpluled as "a prominent separate statement" and would not affect the ordinarily published financial statement.

It is recommended that three adjustments should be made to the financial results as computed on historical cost convention. The adjustments are: (1) depreciation, (2) cost of sales, and (3) gearing. The first two adjustments are aimed to raise the historical cost to current cost, while the third adjustment is to account for purchasing power loss or gain on net monetary assets and liabilities.

Depreciation Adjustment: An adjustment should be made for the difference between depreciation based upon the current cost of fixed assets and the depreciation charged in computing historical cost results. Where the company already has 'appropriate' ways of determining cost depreciation, these should be used. Otherwise, the company may correct the historical cost with specific index factor—either to the industry or the type of asset. To find the correction, the assets need to be grouped according to the year of purchase; the more recent the purchase, the smaller the factor.

Cost of Sales Adjustment: Here also, where the business has already developed appropriate methods of computing the current cost of sales, it may continue to use so. For instance, standard costs, the base stock method or LIFO will also be acceptable. The companies which do not have appropriate method of computing current cost, the cost of sales adjustment (COSA) should be computed using specific index factor. They will be used to revise the historical costs of both opening and closing stocks to the average current cost of the year to compute the cost of sales.

Gearing Adjustment: Its suggested rule vary according to whether the figure for net monetary assets is positive or negative; that is, whether company has net monetary assets or net monetary liabilities position.

Where monetary assets exceeds monetary liabilities, the profits should be charged with an adjustment for the purchasing power loss in value over the year. The charge is to be found by applying an "appropriate" index factor to the net balance of monetary assets (on a verge of the opening and closing balances, unless some other averaging method would give a better view).

Where monetary liabilities exceed monetary assets, inflation accounting aims to show the benefit of gearing. The guidelines state that "where the total liabilities of the business, including preference share capital, exceeds its total monetary assets, a calculation should be made of the proportion of the net monetary liabilities to the net balance of monetary liabilities plus the equity share capital and reserves (including asset revaluation surplus). An amount equal to this proportion of the depreciation and cost of sales adjustments should be credited as a separate adjustment in the statement".

The concept behind these adjustments seems to be fairly simple. In a business either of the two possibilities are there: a (a) company has fixed assets, inventory, and net monetary assets; all these three are financed by equity; or a (b) company has fixed assets and inventory; financed partly by equity and partly by net monetary liabilities. In case (a) where the assets of the company are fully financed by equity, all inflation related cost (that is, current cost adjustment) is charged to the profit and loss account. Current cost adjustment is provided using respective specific indices for different assets. In case of net monetary assets the specific index would naturally be the index reflecting the purchasing power of monetary unit. Therefore, the use of general price index seems to be appropriate to account for loss in value of net monetary assets holding. In case (b) where the company's fixed assets and inventory are financed partly by equity and partly by net monetary lia-

bilities, then only part of its additional inflation-related costs for sales and depreciation will be charged to its income statement. For example, if a company's debt-equity ratio is 1 to 1, then only half of its additional inflation-related costs will be charged to profit and loss account.

III

Managerial Use of CCA : A Case Study

Surprisingly, we find that in India, one company (Hindustan Lever) has been using such procedure for quite some time. To retain 'substance of the business', the company management, in evaluating departmental performance, feel that each product group must make necessary provision for inflation in arriving at the trading profits of the group. The basis of computing total inflationary charge for the company and allocating it to the product groups is given in the Appendix.

For fixed assets, the management provide for an additional depreciation charge which is a differential between current cost depreciation (they call it statistical depreciation) and historic cost depreciation. For inventory, they do not make any cost of sales adjustment as in this case the turnover of inventory, being mostly consumer items, is too fast to recognise any price change during inventory holding period. Nevertheless, in computing cost of sales the company is using some sort of replacement values. An acceptable surrogate of replacement values in computing cost of sales may be LIFO or base stock method.

To compute inflationary charge on monetary items, for no justifiable reasons (at least conceptually), the company is treating inventory as monetary asset to compute inflationary charge (see Appendix). With this treatment of inventory, one may notice from the company's past balance sheet data that it holds a net monetary asset position, which they term as uncovered working capital. On this uncovered working capital they make an inflation charge using general price index Further, the excess of interest over 6 per cent per annum is also considered to be of inflationary nature, and therefore, is added to the gross inflation charge This total inflation charge is then allocated to the product groups in the ratio of average working capital employed by them.

The practice of making inflationary charge seems to be roughly in accordance with 'An Interim Recommendation'. The company must be given credit for initiating the practice well before anybody else. It is yet to be seen, however, whether the management would take the next logical step and publish the results.

Economics of Steel Technology in India

S V Char

The policy implications of the necessary major criteria for choice of technology in steel making include autonomous growth of the iron and steel industry, with a heavy reliance on the integrated BF + LD units. Large investments cannot be avoided. Computations in this article show that, for India to attain its objectives in steel, the ratio of BF + LD to DR + EF capacity would have to be approximately 70 : 30, if not higher.

One could begin long-term planning on such a broad premise, and periodically revise it in the light of new developments such as the discovery of new coking coal mines in Dhanbad and Birbhum districts, discovery and availability of natural gas, electric power generation and availability, etc. It will, of course have to be ensured that vested interests of the one or the other route do not foreclose a periodic review of the choice of technology.

THE Draft Sixth Five-Year Plan (1978-83) envisages a growth rate of 8 45 per cent in the iron and steel sector (metal and ferro-alloys, No 57). To attain this rate, steel ingot capacity would have to be stepped up from 13 30 million tonnes in 1977-78 to 17.60 million tonnes by the end of the Plan. In fact, the existing capacity for crude steel production, including a capacity of about 3.9 million tonnes in mini steel units, adds up to 14 67 million tonnes.

Other projections have placed the required crude steel production at about 25 million tonnes by 1988. The White Paper on the Steel Industry (1976) had set a tentative target of 75 million tonnes by the end of the century. It is against such a background that the Government is attempting to forge collaboration with, Germany, USSR, UK, US and others for establishing new capacity—both by way of expansion, of Bhilai, Bokaro, and other plants as well as by way of greenfield sites. The sites for the new plants already selected or likely to be selected are: Vizag, Vijayanagaram, Goa, Mangalore, Nayagarh, Paradip, Bailadilla, etc.

In the discussion about steel targets, two major lacunae are evident. First, it is not widely understood that the development of steelmaking capacity and the supportive ironmaking capacity have to be in step, and in style, with each other. No discussion can be considered complete or meaningful without an equally elaborate discussion about ironmaking facilities which would, after all, feed the steelmaking units. Secondly, a conspicuous lacuna relates to the selection of a relevant technology. This note, therefore, attempts to discuss briefly the choice of technologies available and the major criteria that should govern technology selection.

Basically, there are two iron and steelmaking processes. One is the conventional route, based on coke metallurgy, i e, Blast Furnace + Linz Donowitz (BF + LD) converters. Instead of the converters, more recently Q-BOP (Quick, Quality, Quantity — Bottom-Blowing Oxygen Process) is also coming into vogue. Under the coke-metallurgy route, it is necessary to make lumpy investments in a coke oven battery complex in addition to heavy investments in certain indivisibilities such as BFs, LDs, post-ingot facilities, auxiliary work-shops, power systems, and townships. The route also presupposes adequate resource support—particularly the existence of adequate coking coal deposits in the region.

A second route which is not so conventional is the Direct Reduction + Electric Furnace (DR + EF) route. The chief attractions of this combination of processes are: that it can do without coking coal which is a very scarce item and that capital costs per tonne of capacity created on greenfield sites would be far less than under the BF + LD. It could be even slightly less than the per tonne capacity created on a brownfield site through expansion. DR of iron-ore into sponge iron, which is the feedstock (along with ferrous scrap) of electric furnaces, is possible with ordinary coal and may be possible even with lignite abundantly available in the country. However, where it is desired to undertake DR with the help of natural gas, it is necessary to ensure that not only are natural gas supplies available but also that they are permitted by government to be used for sponge-making. The price of gas should also be, calorie for calorie, as attractive as that of coal.

More recently, however, synthetic gas from coal gasification is being considered as a dependable fuel for DR. Studies have shown that, in favourable circumstances, the manufacture and use of synthetic gas can be economical as an alternative fuel. The major hitch here,—as in the case of DR itself—is the technological immaturity of the processes for making synthetic gas on a commercial scale.

There are several other variations in the processes of making iron and steel. For instance, where power availability is assured at a low tariff rate, it is possible to smelt iron-ore into pig iron in Tysland Hole or Elkem furnaces which can be vertically integrated with an LD converter. In steelmaking, there are the open hearth, twin-hearth, LD-AC, rotar, Kaldo and other processes. For practical purposes, as well as for the limited objectives of this note, we can choose to ignore them and concentrate on the two basic routes mentioned above — *viz*, the BF + LD and the DR + EF.

Technology or route selection needs to receive much more attention than it has received hitherto. Studies by us have indicated that, for a long time to come, the country would have to rely, to a very large extent, on the BF + LD route or the BF + Q-BOP route—both of which would be based on our limited stocks of coking coal. There can be only marginal increases in electric furnace steel-making capacity. We shall presently see how these tentative conclusions are suggested by certain key considerations.

A comparative study, of the economics of available alternatives in technology, is of overwhelming importance because heavy investments are involved — as high as Rs 8,000 per tonne of ingot capacity even within the battery limits in the case of the BF + LD route. For the DR + EF alternative, this would be considerably less — Rs 3,000 to Rs 4,000, depending on whether the unit is gas-based or solid-fuel-based and whether additional facilities of power and rolling have been provided for within the battery limits. While, therefore, one may instinctively wish to go

in for this lower capital cost technology, in respect of operating costs, the main steel plants have a definite edge over the DR + EF plants which are generally known as 'mini steel units'. But again, it can be established that, the cost of production and fixed overheads in greenfield site DR + EF plant — assuming favourable factors such as adequate power supplies at special rates as in the case of aluminium units, and reasonable prices of coal or gas, scrap, graphite electrodes, refractories and so forth — can be lower than the cost of production in a greenfield site BF + LD steel plant, complete with a coke-making complex. As for the resources support for the two routes, our computations show that, at a relatively high level of steel production of about 60 million tonnes employing only the BF + LD route, the existing deposits of prime coking coal which can be won at reasonable costs, would have a life-time of as long as 43 years. This assumes, reasonably enough, that coke requirements are reduced from around 800 kg/t at present to, say, 600 kg/t (Bokaro's blast furnaces are close to such a level of consumption). A second assumption is that the coking coal/coke ratio would be at a high level of 2:1. If prime and medium coking coals are taken together, their deposits, at the same consumption rates, would last 90 years or more than three times the life-time of a steel plant. Thus it is possible to maintain high levels of hot metal production in BFs — such as 50 to 60 million tonnes per annum for extended periods of upto 100 years or more — by using a judicious mix of prime, medium, and blendable coking coals.

Improvements in BF operations such as tuyere-injection of auxiliary fuel can bring down coke consumption significantly to levels found in the advanced countries (400 to 500 kg) and contribute to the conservation of reserves. If there is a breakthrough in the production of formed coke with the help of blendable coals and inferior coking coals, the life-times would be much longer. However, arduous R & D problems have to be overcome, particularly in respect of the high ash content (27-28 per cent at present as against 23-24 per cent a decade ago). The major bottleneck appears to be inadequate coal washery capacity which even at present needs to be augmented. What is called for are: techniques such as beneficiation of high ash coals won from lower seams, oil agglomeration for upgrading the quality of inferior coking coals and other more commonly known measures.

Coming to the resource support aspect of the DR + EF route, it needs to be understood that the further development of EF units based on ferrous scrap alone is not possible on account of the non-availability of scrap in the market and the soaring price for it. Although imports can temporarily, alleviate the position, the sponge substitute alone can provide a lasting solution to the present difficult situation.

In respect of gas-based DR, as noted above, the major problem so far in the way of setting up units has been one of not only obtaining adequate allocation of gas from Bombay High, but also of obtaining it at a reasonable price. There are other priority consuming sectors which compete for the limited volume, *viz*, fertilisers, power generation, domestic consumers, and others.

To be economical, gas thus made available would also have to bear a price that has some relationship with the price per calorie of coal. If gas is priced at about the replacement value of coal, it would be too cheap at 20 paise per cubic metre and the gas cost alone per tonne (assuming a consumption of 3.2 Gcal/t as under the Midrex process) would be as little as Rs 64.00/t. On the other hand, if it is priced at the replacement value of fuel oil (which is much more likely), the gas cost alone would be Rs 320/t. Gas would thus appear to be pricing itself beyond the reach of the proposed DR units along the West Coast.

It should be noted, too, that even if an entire quarter of the Bombay High gas production of 2.2 million m^3/day is earmarked for gas, it can sustain sponge production of about 500,000 t/year for a period of only 15 years by which time the gas wells may be fully depleted.

In this setting, the recent conclusion of an agreement with Indonesia for production of sponge iron in that country, making use of its ample volumes of natural gas should be welcome. Production arrangements of this kind augur well for augmenting the quantum of feedstock available for the existing EF steel units in the country which are not only starved of good quality ferrous scrap but have also to pay an increasingly prohibitive price for it. At current levels of scrap prices (April 1979) or even at three-fourths thereof, the substitution of scrap by sponge should prove to be economical. It would also have a salutary effect on scrap prices. One can even reckon with a better control of the quality of steel produced.

In respect of solid reductant DR, which has been attracting for the last few years the interest of state industrial development corporations as well as the Ministry of Steel, unless there is a measure of success in the case of a couple of units to begin with, there may not be any desirable demonstration effect. As yet, in India, there has been no sponge production except on a pilot plant scale. As such, there has been no proven commercial success with any of the several available DR processes using solid reductants, in particular with the well known SL/RN, Krupp, NML process, TISCO process, or any other. Therefore, the sooner a breakthrough is achieved in this respect, the brighter would be the prospects for the coal-based DR + EF route. The Kothagudam (AP) plant based on Lurgi knowhow and the Nayagarh (Orissa) plant based on Allis-Chalmer's technology, can therefore be deemed to be bellwether plants on whose success so much of the future of solid reductant based sponge-making in India squarely depends.

In the case of the DR + EF route, one would also have to take due account of the present unsatisfactory electric power supplies. Power is one of the basic inputs for melting ferrous scrap in EF. This should be worrisome, no doubt. What one is concerned with, however, is the future position in this respect — say, 15 to 20 years hence. In planning the facilities, it is but natural to make an intelligent guess whether there would be adequate inter-sectoral balanced growth, such that, there would be no power inadequacy for electric furnaces, making a claim of not more than, say, 1 to 2 per cent of the entire power generated.

The present trends in technological choice, in both the developed and the developing countries, are more or less in favour of cautious adoption of the DR. But the developed countries have been rather chary to take up this frontier technology as enthusiastically as have the developing countries — in particular, Mexico, Brazil, oil-rich countries and others. In the case of Spain, Italy, and a few others including India, in which the share of EFs in overall steel capacity range from 27 per cent (India) to 37 per cent (Spain), there are hardly any DR plants of proven commercial success. The feedstock for EFs happens to be ferrous scrap. In Spain, domestic availability is substantially augmented by imports and also by undertaking ship-breaking activities. In Japan, where EFs account for about 20 per cent of steel production, there have been encouraging results with the forerunner DR plants.

Most of the EFs, anywhere in the world, are unsupported by DR; but they serve to recycle scrap arisings within a steel plant, in engineering industries and on account of obsolescence and wearing out and junking of capital equipment and vehicles. In the coming years, EF capacity can expand practically everywhere only if there is a simultaneous growth of DR capacity — scrap availability not matching the needs even as of now. In contrast with such difficult circumstances obtaining in respect of the basic inputs of the EFs, it would be safe to assume that the old iron horse BF would continue to be the most dependable process for bringing about sizeable increases in the hot metal-making capacity to feed the LD and Q-BOP steelmaking facilities.

The global process-wise data for steelmaking indicate that there is an inexorable trend towards giving up the outdated open hearth furnaces and for employing LD converters where bulk steelmaking is called for as well as towards resorting to EFs where it is a question of only meeting the incremental demand for steel. At present, world steelmaking capacity is approaching the 1000 million-tonne mark. The processwise break-up, going by trends hitherto, is likely to be Basic Oxygen Furnace (BOF or LD converter) 60 per cent, EF 19 per cent, and OH and others 21 per cent.

Several joint ventures, tying-up resources and finances, are coming into vogue. There is also a tendency towards semi-integrated units : mining iron-ore and other raw materials in a region well-endowed in them, producing sponge iron in a gas-rich area, making steel in yet another place, and may be rolling and shaping them at an altogether different location. A pre-requisite for such production-sharing and tying-up arrangements is the availability of all the necessary inputs and services at the lowest possible comparative cost. The loss in economies due to non-integrated production and long haulages can be compensated, theoretically at least, by the lower prices of inputs.

Four more important criteria governing the choice of technology need to be underscored here :

First, in deference to the fact that India is long on labour and short on capital, every attempt should be made to ensure that the technology selected, other things being equal, gives employment to a larger complement of the work force and at the same time makes a relatively smaller claim on the limited capital resources. At the same time, one cannot ignore the fact that, by its very nature, the steel industry, particularly the coke metallurgy route, calls for considerable capital deepening and as such, one cannot expect steel plants to create jobs to any large extent.

A second criterion relates to the requirements of funds to establish steel capacity. This is, in fact, a more relevant criterion to govern the choice of technology in iron and steelmaking. The DR + EF would definitely be the choice, provided the location has the necessary resource support to sustain such technology, and it is available cheap.

Thirdly, discussions about new steel capacity to be meaningful have invariably to be informed of size-related economies. One should exercise sufficient caution to ensure that the economies of scale, which are very sizeable in the BF + LD route, thanks to the indivisibilities and capital deepening, are achieved to a large extent. Our computations show that about 90 to 95 per cent of the economies can be achieved at a minimum economic size of about 5-6 million tonnes. There are economies of scale, even in the case of the DR + EF, but at a relatively small scale of about 250,000 tonnes. The economies based on scale are soon exhausted and replicated units or modules under this route have almost the same capital cost. The DR + EF would enable establishment of additional capacity within a short time, merely by the addition of modules, so that incremental demand for steel can be easily met. Where, however, large increases are called for over any given period and there is an assured supply of coking coal, the BF + LD route, notwithstanding its higher capital costs, can prove to be attractive. The economics of BF + LD can be vastly improved by achieving size related economies, individual pieces of equipment themselves being of the largest technically feasible size such as 7-metre high coke oven batteries, 10,000 tonnes per day BFs, 250 tonnes per day LD converters, and so forth. Such technical economies are available for DR + EF also, but as stated only to a smaller extent. Against this techno-economic guideline, one is concerned to note that the sizes of the proposed new steel plants at Vizag, Vijayanagaram, Goa, Mangalore, Nayagarh or elsewhere have been decided upon without reference to the minimum economic sizes of the plants as a whole or individual pieces of equipment. This would invariably involve loss of size-related economics. Secondly, fragmentation of future capacity in several plants at different locations are proposed mainly on the basis of extra-economic considerations, and would handicap them in techno-economic viability. Such a development would have far-reaching significance for public policy.

A fourth criterion, which in recent years is being granted considerable weightage, is energy. From the iron-ore to the ingot stage, the energy required under the BF + LD route is 5.34 Gcal, whereas under the DR + EF the requirement is significantly less at 4.5 Gcal. But one would also have to take particular note of the fact that, the DR + EF requires such energy to a considerable extent, in the form of hydrocarbons which is fast getting depleted and becoming scarce. The BF + LD on the other hand requires them in the form of fossil fuel, *viz*, coking coals and other coals in which the country is placed in a more comfortable position. Electric power is another important scarce form of energy without which steelmaking cannot take place under the DR + EF route. While it is admitted that Indian coking coal is not of good quality and is also not adequate, a measure of optimism in the life-spans of such deposits, is not unjustified, even at high levels of pig-iron production by means of blending them with other coals and producing formed coke and adopting new techniques in blast furnace operations. For purposes of conservation of domestic coking coal it would be worthwhile also to import coking coal of superior quality provided the price/quality trade-off justifies it. The present experiment with Australian low-ash (7-10 per cent) coking coal at an average price of about Rs 700/t should therefore be followed with interest.

The policy implications of these major criteria for choice of technology are mainly that there would have to be continued autonomous growth of the iron and steel industry with a heavy reliance on the integrated BF + LD units. Large investments cannot be avoided. Our computations show that for India to attain any objectives in steel, the ratio of BF + LD to DR + EF capacity would have to be approximately 70:30, if not higher. One could begin long-term planning on such a broad premise and periodically revise it in the light of new developments such as the discovery of new coking coal mines in Dhanbad and Birbhum districts, discovery and availability of natural gas, electric power generation and availability, and so forth. It should always be ensured that the vested interests of the one or the other route do not foreclose a periodic review and discussion of those aspects of the long-term development of iron and steel industry that relate to choice of technology.

Organisation of the Carpet Industry of Bhadohi

Sheobahal Singh

The present paper attempts to describe the organisation of the carpet industry in Bhadohi. Though it is a cottage industry, many characteristics of the capitalist system of production are manifest. The present discussion, however, confines itself to explaining how the organisational structure is connected with entrepreneurial activity, and what sort of activity determines entrepreneurial success and economic development. Some of the activities expected of the entrepreneur are universal and standardised.

The present analysis is based on the field observations carried out in the woollen carpet industry of Bhadohi. The entrepreneurs in our study are the carpet manufacturers in the town.

BHADOHI is a flourishing class III town of Varanasi district with a population of 24,000 people. It is situated in the eastern part of Uttar Pradesh. The town is located on Varanasi-Delhi railway line, about 70 km to the West of Varanasi — a city known for its religious importance. The town is well connected by road and rail to other parts of the country. It is even internationally known exclusively for the carpets manufactured there. No other industry or business exists in the town. Although carpets are manufactured in the entire area known as the 'Mirjapur-Bhadohi belt' Bhadohi is the main trade centre. Woollen carpets are a luxury commodity to be sold at an exorbitant price. The carpet industry has played a big role in the economic development of the town.

Carpet weaving, in the area, has been the traditional occupation of Muslims.[1] But it is no longer their exclusive monopoly. A considerably large number of non-Muslims have now entered the trade Data gathered from the field in fact reveal that religion as such has not played any significant role in determining entrepreneurial involvement. Muslims were probably the most successful in carpet manufacturing because of the relations between the *weavers* and the *manufacturers*. But the Hindu entrepreneurs are not only larger in number but are also more successful in the carpet *business*. This reflects that local artisans cannot easily rise to the *position* of entrepreneur.[2] That the majority in the trade are Hindus is also a definite mark of change in their occupational outlook. We also found that, although caste plays no role in entrepreneurial involvement, yet Banias are more adaptable to occupational opportunity.[3]

While many Indian handicrafts succumbed to the challenges of technological modernisation, the carpet industry — one of the urban handicrafts[4] — has not only successfully withstood the onslaught of technological development but has flourished over the years. This is due to the adaptability that the industry has shown to new situations.

The carpet industry of Bhadohi manufactures artistic floor carpets and rugs of fascinating designs, which are a big attraction in the foreign markets. The tradition of carpet manufacture in Bhadohi goes back to at least 400 years. *"Ain-Akabari"* (1600 AD) by Abul Fazle is the oldest record in which reference appears to carpet weaving in the area.[5] The hand-knotted carpets of Bhadohi constitute 95 per cent of the total carpet export from India. Moreover, only about 10 per cent of the total carpet produced in India is locally consumed. The remaining 90 per cent is exported to foreign countries. The export of Indian carpets has increased from Rs 3.22 crores in 1947-48 to Rs 36.05 crores in 1974-75.[6]

Process of Carpet Manufacture

Carpet manufacturing involves a good deal of specialisation. The whole organisation opens up employment opportunities to a large number of workers, and represents a tightly knit nexus of interrelationships among the people engaged in the industry at different levels.

The carpets manufactured in Bhadohi are not all woollen. The warp is made of cotton twisted thread and knots of woollen yarn. The wool is procured from different parts of the country — such as Jhansi, Agra, Kanpur, Fatehpur, Rajasthan, Punjab, and Gwalior. The local names of the cotton thread and woollen yarn are *soot* and *aanga*, respectively.

The different processes in carpet manufacture include picking and sorting of wool, carding, spinning, dyeing, weaving, trimming and washing. The tasks of picking and sorting of wool, and carding and spinning, are not much in vogue today. Some people still do this work in their own homes. A rough quality of yarn is supplied to the small manufacturers. These works were previously significant when the industry was not so developed. Today, however, the manufacturers are supplied with ready-made woollen yarn by different woollen mills.

Woollen yarn is dyed in different colours as required in the design of the carpet. Previously, wool was dyed by indigenous methods. Few big manufacturing units have installed mechanised dyeing plants while many others have established kilns for the purpose of dyeing. The lower rank manufacturers do not have their own plants and manage to buy coloured yarn from yarn shops.

A major part of carpet manufacture is weaving. Carpet weaving is carried out on looms by weavers in their own homes. Most weavers have their own looms. Only a few do not own their looms and weave on looms owned by master-weavers or commission agents. Usually, commission agents or manufacturers advance some money to weavers to instal looms. Such weavers are contractually bound to weave the carpet for those, who have given them the money in advance. This contract is only socially sanctioned and there is no formal legal agreement.

The loom on which the woollen carpet is woven is of a vertical type consisting of two rollers — one for rolling the woven carpets and the other for holding the warps. In Bhadohi, the lower roller is generally placed in a trench, half a foot or so, in the ground. The length of the trench varies with the length of the roller which also depends on the size of the carpet.

The weavers hand over the woven carpet to the manufacturer who gets it trimmed or 'clipped' by the clippers Clippers are permanently employed by the manufacturers Small manufacturers do not employ these clippers permanently. They engage, professionally independent clippers, on daily wages,

according to their need. Like weaving, clipping is a skilled work.

Although clipping is the last stage in the process of carpet manufacturing, yet good-quality carpets have to pass through another stage before they are put for sale. This stage is that of washing and it comes after clipping.

ORGANISATION AND ENTREPRENEURSHIP

Since all the processes of carpet manufacturing are not carried out in the workshop of the manufacturer, he has to keep himself busy for a longer time than is normally required of entrepreneurs in general. The manufacturer has to get all the stages properly linked with one another in order to have a well-knit system of production.

The organisational set-up of the carpet industry has a peculiar nature It is a cottage industry but, unlike many cottage and small-scale industries, it has some characteristics of the medium-scale industrial system if evaluated in terms of the level of investment and the number of employees in the firm.

All the manufacturers have their established workshops either in their residential complexes or in a separate building in the town, where work such as dyeing, clipping, washing, and business correspondence is done Weavers are not employed in the firm. This is possibly because, such a large number of weavers cannot work under one roof. The manufacturers, however, reported that they would not like to employ the weavers permanently. This is for three basic reasons: paucity of the accommodation, payment of higher wage if weavers are directly employed in the firm and fear of unionisation of the weavers.

The weavers also do not want to be full-time employees in the firm. In the present situation, the weaver is a 'free' worker. He does his weaving in his own house where he is able to look after his family affairs simultaneously. He continues with his work on the piece of land he owns, which he would not be able to carry on if he were a permanent employee in the firm. The weavers' economic calculation is that, even if he would get an additional wage if employed in the firm, he would not be better off because he would not be able to cultivate the land. The weaver's lot in the present system is much better than it would otherwise be This reflects the prevailing economic situation, and hence outlook, of the people in the villages.

The style of entrepreneurial activity differs from manufacturer to manufacturer. As the scale of the manufacturing unit grows, the activity becomes more systematic and sophisticated. But the overall style of work is similar in all the industrial concerns whatever their size.

Most of the firms have export licences. Non-exporting firms either prepare carpets for local consumption or manage to supply them to foreign markets through the big exporters. The big firms usually get the carpets manufactured against orders placed with them by the buyers. How many orders there are with the manufacturer depends on the demonstration effect and the credibility he manages to earn The manufacturer has direct dealing with the buyers through correspondence. Big manufacturers sometimes visit foreign markets and also invite the buyers to their firms. Since the bulk of the carpets are made to order, entrepreneurship involves lower risk than in other export business. However, the manufacturer has to be time-conscious as he has to arrange the shipment in time. Failure to do so sometimes leads to cancellation of the orders or to awful delay in the shipment whereby the circulation of the capital is blocked.

In order to supplement the capital for investment the manufacturer has to take loans from banks. The banks extend loan to the manufacturer against LC (Letter of Credit). Therefore, the orders are helpful in procuring loans. Although there is a definite procedure for advancing loans by banks, some discretion is left to bank officials. The big manufacturers are favoured and given heavy loans on easy terms— which the small manufacturers are deprived of.

The manufacturers have to establish contact with different agencies, which provide them with different types of raw materials such as woollen yarn, cotton thread, and chemical dyes. The agents dealing with these materials, who have opened their offices in the town, are found to be more liberal and considerate in their dealings with upper and middle class manufacturers. They supply them raw material on credit for longer terms

The most important aspect of entrepreneurial activity in the carpet industry is the manufacturers' attempt to establish contact with weavers. This requires a great deal of talent, leadership and sociability on the part of the manufacturer. The industry is flourishing as a result of the demand for carpets from foreign countries. This has led to an increase in the demand for weavers whose number is more or less limited. Upper-caste people, particularly Brahmins and Rajputs of the area, have not generally taken to weaving so far In their opinion, weaving would downgrade their social position, as it is traditionally associated with Muslims and at present only lower caste people are engaged in this work. This has been an added factor in the shortage of weavers. In view of the situation a large number of training centres have been opened under the control of All India Handicraft Board at different places in the area. The institution imparts six months' training and provides trainees with a stipend of Rs 60 per month But still the supply of weavers is not commensurate with their demand. The situation has resulted in cut-throat competition among the manufacturers for engaging as many weavers as possible. The mode of approach to weavers, depending upon the personal style of work differs from manufacturer to manufacturer. However, a commonly noticeable style of approach is as follows. We may divide the manufacturers into big, medium, and small.

Mostly, big manufacturers get their carpets woven through commission agents. The commission agent is a middle man who keeps some looms and weavers at his command, either by giving some money in advance to the weavers or through personal influence Weavers thus engaged are locally called *asamis* (tenants). The relationship between weavers and commission agents or manufacturers is feudal to some extent. But there is an element of the democratic and the contractual and no case of bondage or serfdom prevalent in the strictly feudal system is seen. Weavers stop weaving for a manufacturer and start weaving for other manufacturer if they get a bigger amount of money in advance. The big manufacturers take full advantage of this and have managed to engage a large number of weavers because they are affluent enough to advance more money to weavers. Commission agents work for the manufacturer. They are supposed to transport the raw material to weavers, and subsequently transport woven carpets to the manufacturers They establish liaison between weavers and manufacturer and are paid by the manufacturer around 10 per cent of the total cost of weaving.

The middle class of manufacturers operate through commission agents as well as through direct contact with weavers. Manufacturers of this category have a more cordial relationship with the weavers.

The small manufacturers do not engage commission agents. They have personal contact with weavers, and since they are unable to make heavy investment because of inadequate capital in their possession, they do not engage highly skilled weavers. They get only a rough quality of carpets manufactured.

In the course of trade, manufacturers have to face many problems posed by government officials. They are required to please personnel connected with different departments, such as income-tax, sales tax, quality control, and labour department. We found the lower category of manufacturers more unhappy with the behaviour of these officials than the others. Medium and big manufactures do not feel harassed so much because they can bribe them and also establish good relations with them. Unlike other industrial concerns, the organisational set-up of the carpet industry is wide and fragmentary. This imparts on the manufacturers not only a managerial and bureaucratic responsibility but also requires him to be industrious and social, and to have leadership qualities.

In the carpet industry of Bhadohi, those manufacturers have proved to be more successful who are less authoritarian towards workers especially weavers and more friendly with bank officials and commission agents who supply raw materials. Formal relations do not help much. The industry at present has a profit-investment position which is so promising that there has developed cut-throat competition among manufacturers. Some manufacturers try to establish good relation with government officials and the political elite who are helpful in the course of their trade in one way or the other. But this type of network can only be supplementary. What matters most is the proper management and successful operation of the concern.

In the carpet industry of Bhadohi the immigrant manufacturers have been found to be more successful than the native manufacturers. These immigrant manufacturers, because their social position in the area is not established, neither have a relationship with local politicians nor are able to attract government officials. What has helped them is their devotion to and insight into entrepreneurial work.

In the carpet industry of Bhadohi internal network,[7] i e, the relationship with weavers, commission agents, different agents who supply raw material, and bank agents, is more significant than the external network, i e, the relationship with government officials or politicians. Panini, in his study of entrepreneurs in Faridabad, observes: "the entrepreneurs who become more successful and prominent are those who spend more time outside their workshops and factories and participate in cocktail culture.....The style that succeeds is one which lays stress on building and articulating a powerful network". His overemphasis on the network of relationships, i e, establishing relationship with politicians and officials, undermines the basic postulates of entrepreneurial theory. Maintaining a network of relationship with the personnel outside the industrial organisation may to some extent be necessary in business but it is in no way a substitute for enterprise in organisation.

The success of entrepreneurship depends on how skilfully an entrepreneur operates his business undertaking itself. The rest is useful only after considerable economic achievement has been made. Accessibility to high officials and the use of cocktail culture, referred to by Panini, is possible only for those who have become big entrepreneurs.

UGANDA

Fall of Idi Amin

TO many, Idi Amin's end was incomprehensibly anti-climactic. He was the tyrant who had smashed even a murmur of protest with brute force. Medieval savagery with modern weapons—that was his style. Now the very dictator who had brazenly flaunted his military prowess had simply melted away as the hour of reckoning approached, without so much as a fight. The most militarised regime in the region thus failed to survive a military confrontation.

To understand the source of Amin's weakness at the final hour requires understanding the source of his strength at its prime, his local base, his foreign support, the nature of the military machine he built up, and the character of the opposition that he faced. For, by the time he fell, his local base had disintegrated; his principal foreign supporters had deserted him; the pride of place in his fascist regime, the military machine, was riddled with factionalism and indiscipline; and Amin himself had succeeded in multiplying and unifying the ranks of the opposition, both internal and external.

Paradoxically, the regime that consolidated itself through the gun was weakened by the same gun. Many an observer was content to compile statistics of the regime's brutality and then wonder why it continued to survive in spite of such a staggering record. What such observers never understood was the social character of violence, that at every point violence is directed towards specific socio-economic ends. Should its use accord with dominant economic interests, foreign and local, it will be supported by them. Should it not, it will have to confront these, sooner or later. As the brutality of the Amin regime passed from the first category to the second, the regime became increasingly isolated and vulnerable.

Local Base

Local support for the 1971 coup ranged from Ugandan capitalists estranged by Obote's nationalisations to a section of the popular classes who momentarily welcomed any change from a regime that had muffled them. Technocrats and bureaucrats, the mechanics of a private enterprise economy, staffed Amin's first cabinet. Propertied interests, foreign and local, applauded. Both turned a blind eye to the first wave of massacres of thousands of Acholi and Langi soldiers towards the end of 1971.

But Ugandan capitalists have had a historical weakness which was to have a telling effect on their relations with the regime. They share the weakness of their counterparts elsewhere—they grew up in a colonial economy and continue to be dominated by foreign capital, there also exist sharp internal divisions within this class, a product of Uganda's specific colonial history Its strongest section, the Asian capitalists (for instance, the Madhvanis and Mehtas) came from a minority nationality and were closely identified with British colonial interest. The rest have also failed to coalesce as a unified force politically. Unable to form a single party to champion the interest of property, they formed several. Each section tried to rally behind it a segment of the people on a religious, regional, or tribal platform. Because of its organisational weakness, this class has often had to act by proxy, as at the time of the Amin coup.

In 1972, Amin took advantage of this division within the capitalist class. Also, like other fascists before him, he tried to channel the anti-imperialism of the people into a racist mould. He expelled the Asian capitalists (along with Asians of other classes) and promised paradise to the rest.

But only so long as this Paradise remained a promised land could it be shared by the multitude. Once the spoils had actually to be divided, only the fittest could survive. Now, Amin's officers were not about to queue up behind the big businessmen for a share of the loot. In no time, the cabinet of technocrats and bureaucrats was sent packing on a long vacation. The first predominantly military cabinet was formed. The most ambitious of the businessmen were either killed (for instance, Michael Kawalya Kaggwa and Augustine Kamya) or they simply ran away. The rest of them, to continue to function, became extreme opportunists ignoring all else so long as some money came their way. It was then that the military-capitalists, such as Ali Fadhul and Nassur (not to speak of Amin himself), were born as a group. The people baptised them the *Mafuta Mingis* (men of much oil) after *Operation Mafuta Mingi*, the name Amin gave to the Asian expulsion. Brought to life by Amin, the main local beneficiaries of the coup and the expulsion, the *Mafuta Mingis*, prospered under him but in time found him the main obstacle to their continued growth.

Foreign Support

Britain, Israel and the US were delighted with the turn of events in 1971, and they showed it. In fact, the first two had actively participated in the coup that realised their good fortune.

But soon these two were in trouble. To deprive the Obote forces of the base they had been granted in neighbouring Sudan—and to benefit from Libya's promises of aid—Amin expelled the Israelis who had used Northern Uganda as a base to supply Anyanya guerillas in Southern Sudan. That same year (1972) he expelled the Asian minority, the capitalists among whom were intermediaries for British commercial interests in Uganda. In retaliation, Britain and Israel tried to cut the regime's lifeline to the international market through an economic embargo. For an effective embargo, however, they needed superpower co-operation.

Now, no neo-colonial regime (let alone a fascist one) can survive if opposed by a united front of imperialist powers. Amin's regime survived as long as it did in part because it always found one or another imperialist power to patronise it. In 1972, the British-Israeli embargo failed because neither the superpowers nor other imperialist powers were willing to support it.

In fact, beginning 1973, both the US and the USSR stepped up their presence in Uganda. The US purchased the coffee that Britain would not. (Coffee sales accounted for over 90 per cent of Uganda's foreign exchange under Amin.) From buying a-fifth (20.6 per cent) of Uganda's crop in 1973, it took a-third (33.5 per cent) in 1976, emerging as the regime's principal trading partner. In time, relations between the two became even cosier—though covert—as US firms supplied Amin with much needed intelligence support.

The main external training ground for the dreaded State Research Bureau was the US and, later, also the UK. According to information that surfaced at the US congressional hearings on US-Uganda relations, in 1977-78 alone over 70 agents of the regime were trained in the US. Most of them were members of the State Research Bureau and many were trained as helicopter pilots or as 'communication specialists'. For example, the Harris Corporation, which sold Amin 'tactical trucks' and installed earth satellite stations and 'mass communication systems', signed a four-year contract on April 17, 1977 to train the necessary personnel. Bell Helicopter Textron, which sold helicopters to the regime, trained 21 pilots and mechanics at its Fort Worth, Texas facilities in 1977.

The Soviet Union, on the other hand, became the regime's principal arms supplier. Following the visit of a Soviet military mission in November 1973, MiG-19s and TU-54 tanks rolled in. By 1975, the fascist regime had received an estimated $12 million in economic 'aid' and $48 million in military 'aid' from the Soviet Union. According to the Soviet

Ambassador to Uganda, the "aid" was "in the interest of peace and security of all peoples"!

Once convinced that the regime was no passing affair, the peddlars of yens, marks, liras and francs—as those of dollars and rubles—rushed in. Japan came into road construction and transport, West Germany in mining and prospecting, Italy to shore up manufacturing and electricity generation, and Belgium to provide railway maintenance.

Its economic blockade having failed, Britain also made the best of the new situation, soon becoming the regime's second largest coffee purchaser (20.5 per cent in 1976). Barclays Bank returned to Kampala. Israel came in through the back-door, using front agencies like ATASCO (jointly owned by the Israeli Ministry of Defence, the US Export-Import Bank and an Israeli tycoon called Eisenberg) and Zimex-Aviation (a Zurich-based front for the Israeli intelligence, Mossad) to supply aircrafts and crew for Uganda Airways, established in 1977.

It is only in the context of this imperialist jamboree in Uganda that we can assess support from regimes such as Libya, Saudi Arabia, India, Pakistan, and Bangladesh. Whereas the latter three made available much-needed technical personnel, the reactionary Arab regimes gave Amin financial contributions at critical moments, such as at the time of the 1975 OAU summit in Kampala. The Libyan connection was by far the most important: investments channelled through the Libyan-Arab Development Bank in such spheres as sugar, transport and cement production were valued at $25.5 million in 1976.

So long as it was business as usual in Uganda, bankers and merchants were willing to turn a blind eye to all else. This was the first source of Amin's strength. Whatever the exposures of the regime's brutality, business came before politics.

RESISTANCE AND ECONOMIC CRISIS

Having consolidated its control over the State machinery, the regime tried to gear all economic activity towards building up a mighty war machine. Fully mechanised battalions, complete with tanks and armour, was the goal. Expenditure to maintain the social and economic infrastructure, let alone to develop it, was reduced to a trickle. Scarcity and inflation were the harvest the regime reaped in a short period.

The effect on the town population was immediate. Workers went on strike, in 1974, at the Lugazi Sugar Works, and in 1975, at the Kilembe Copper Mines. But every open manifestation of protest was suppressed. Strike leaders were killed and unions were banned.

The combination of repression and economic hardship also stirred student opposition. Makerere students' demonstrations of early and late 1976 evoked favourable response from the lower and middle strata of Kampala. But civilian protest, without clarity of long-run vision and a correspondingly high level of organisation, could not withstand the baton and the bullet the soldiers let loose against it.

In the countryside, matters stood somewhat differently. In a predominantly rural society, the effect of economic crisis moves from the town to the countryside. Because peasants grow their own food and build their own shelter, the effect on the countryside is necessarily limited. Subsistence production was the peasant's response to urban tyranny. And it was indeed a devastating response.

Faced with the inflation of industria prices (of textiles, sugar, soap, salt), while agricultural prices remained stagnant, peasants simply stopped growing cotton and began uprooting coffee trees. In his budget speech of 1974-75, the Minister of Finance estimated that cotton production had declined by 60 per cent. That minister was heard of no more. It was also the last budget speech under Amin. Meanwhile, a spiral movement had begun: repression coupled with harsh economic conditions fuelled the peoples' resistance which in turn deepened the economic crisis and made the regime even more repressive.

Under such conditions of tyranny and massacre, however, the opposition of an unorganised people could only be silent and sullen. Open defiance was sporadic and spontaneous. The few who could vote voted with their feet. This is why the first and for a long time the only manifestation of organised opposition was among exiles—particularly those in neighbouring Tanzania—who faced far more favourable conditions for organisation. But exile politics also had its drawback. Removed from the actual situation at home—and, therefore, from conditions which would have had a unifying effect on any opposition—exile politics was shaped by secondary questions, question far more divisive. Exile organisations were many and weak. This absence of an all-round organisation that could harness, concentrate and direct the entire opposition was the second source of Amin's strength.

WARLORDISM AND DISINTEGRATION

No organism is immune from its environment. The economic crisis could not but have an effect on Amin's army. A shrinking pie intensified squabbles among those who wanted a share of the spoils. It also affected the very character of the State power.

Amin's newly-rich officers knew the one sure way of making money—through the gun. Over the years, any civilian authority that could exercise a measure of control over the armed forces, in the name of preserving law and order to ensure regular trade, was done away with. When in 1972, the civilian cabinet was replaced by a military cabinet, a few of the civilians survived as members of later military cabinets. In 1977, those remaining also left Oboth Ofumbi for the grave and Henry Kyamba for the US.

The same tendency was evident at the local level. In 1975-76, the administrative map of the country was redrawn to create 10 provinces, each with its own military governor. Every one of Amin's top officers now acquired his 'own' province. He treated it more like the fiefdom of a feudal lord than the responsibility of a local administrator. From the revenue and the produce of 'his' province, the military governor could now enlarge his personal booty. Less and less of coffee, sugar, tobacco and tea found its way to Kampala for export. More and more was smuggled to neighbouring countries such as Kenya, Sudan and Zaire by the military governors.

The central treasury now looked more like a provincial chest. Amin found it difficult to ensure for his troops the sumptuous living to which they had become accustomed. The 'whisky run' to London's Standsted Airport could only suffice for a select few. Soon, Amin found it difficult even to pay soldiers' salaries in time.

This calamity had a two-fold result. On the one hand, in a situation where each military governor had his own domain, Amin himself began to resemble a warlord. He could no longer physically eliminate top military brass such as Colonel Moses Ali, the Minister of Finance, until July, 1978. He could only dismiss them, if even that. On the other hand, with soldiers increasingly exposed to economic hardships civilians had long known discontent spread within the lower ranks of the army.

The ground was rife for coups and mutinies, as in fact it was the case during the last years of the régime. In response, Amin relied more on non-national mercenary elements in the army—those from Southern Sudan and Eastern Zaire. He then cut off the rest of the army from access to the armoury. Thus, when Israeli commandos landed at Entebbe in July 1976, it is most likely that the soldiers at the airport were limited to the ammunition they had in hand and to no more. Also, the raid exposed to the outside world Amin's military weakness. Finally, those disgruntled officers whom Amin found difficult to eliminate for fear of their support in the army were transferred, demoted, or dismissed.

The round of coup attempts reached a

climax with the one in mid-1978 led by none other than Amin's second-in-command, Vice-President and Minister of Defence, Mustapha Adrisi. Sent to Egypt for recovery, Adrisi had to be returned to pacify troops loyal to him—though now stripped of his Defence portfolio. Such was the background to the widespread mutinies of late 1978 in the Simba (Lion) Battalion in Mbarara and the Chui (Leopord) Battalion in Gulu.

Kagera Invasion

By then, Amin's army was seething with internal feuds. The little discipline it could have boasted of earlier had melted away. Why then did Amin embark on an adventure such as the Kagera invasion?

Incredible as it may sound, Amin must have seen the invasion as a solution to his dilemma. The battalions that participated in the invasion were precisely those that were the most problematic to Amin, the Chui and the Simba battalions. The predatory character of the invasion—that the invading troops took with them all forms of movable property while destroying the rest—provided the disgruntled troops with new pastures for pillage and plunder. Finally and, probably most significantly, through the invasion and through his threat that the next time around he would permanently annex the Kagera salient, Amin hoped that Tanzania would permanently neutralise the Ugandan anti-Amin forces on its territory. For what Amin dreaded most was the possibility of a connection between the exile opposition in Tanzania and the mutinous battalions in Uganda.

But the invasion precipitated the very situation it was designed to avoid. Tanzania was determined not to get involved in the diplomatic quagmire Amin had prepared for it: a recipe designed to neutralise the Ugandan opposition inside Tanzania, to cast the whole question of fascism in Uganda and the fascist invasion of Tanzania in terms of the single issue of the territorial inviolability of all State boundaries and to shift the question from the battlefield to the conference table. It was a recipe designed to not only let Amin off the hook in exchange for no more than some pious proclamations but also to paralyse the exile opposition.

Instead, Tanzania gave free rein to Ugandan anti-fascist forces. It carefully and methodically prepared the groundwork—internally and internationally, militarily and diplomatically—for countering Amin's forces. Finally, Tanzania launched its own counter-attack.

The new situation provided the impetus for the entire gamut of Ugandan opposition forces, who understandably sought to take advantage of Amin's weakness, to come together at a conference in Moshi and coalesce into a single organisation: the Uganda National Liberation Front. As Julius Nyerere argued: "There are two wars going on in Uganda: one, by Ugandans fighting to free themselves from a fascist dictator; the other, by Tanzanians fighting to defend their national sovereignty". The point, though, was that both wars had the same target: the regime of Idi Amin Dada.

Ironically, it was none other than Amin himself who had played a central role in bringing together all forces, internal and external, opposed to him. And that too, at a time when his regime was wrecked with internal divisions and his margin of manoeuvre in the international arena was rapidly narrowing.

Foreign Powers

For the superpowers, the October War was one they had not initiated. But like other local conflicts around the globe, they had to reckon with it; if possible, by turning it to advantage. For the Western powers and the racist regimes they support in Southern Africa, the Kagera invasion was immediately a blessing from above. For some time, the racist regimes had sought to implement in Southern Africa the strategy Israel had perfected in West Asia: attack the Frontline States, one by one, make it appear as an inter-State conflict and neutralise them, also one by one. Thus the round of invasions against Mozambique, Zambia, Botswana, Angola. But there was a problem: neither South Africa nor Rhodesia shared a border with Tanzania. Now Amin, the man who was already training Sithole's private army, had presented them with a solution: a war by proxy. The most reactionary forces on the continent began to crowd around Amin.

Whereas the smaller reactionary powers are incapable of looking beyond their noses, the vision of the imperialist powers necessarily embraces the whole world. But no matter what their strength, the superpowers do not act on a blank State. It is objective reality, 'the facts of the matter', as they say, that compelled the US to shift its stance. Already by 1978, it had been aware of the weakness of the Amin regime, of both the necessity of law and order in Uganda to facilitate regular trade and profits and of the risks of political exposure—in the context of Carter's 'Human Rights'—if open relations with a regime as oppressive as Amin's continued. Of course, the US embargo on trade with Uganda did not put a stop either to covert relations or to indirect trade (to the purchase of Uganda coffee either smuggled through Kenya or flown to Djibouti and shipped to New York by French merchants). But now, it had to contend with a new factor: that while it could not openly support Amin, the possibility of his being overthrown was becoming a real one. A change of position was required to be on the right side of the wind. The US sought a foothold in the anti-Amin camp.

The USSR, on the other hand, had openly armed the fascist regime ever since 1973. Its options were far more limited. In this hour of Amin's crisis, the time had come for the USSR to support its ally. To do so, however, would be to risk political exposure without compensating gains. The USSR was paralysed. Soviet officialdom looked the other way as Ugandan students demonstrated against Libya in Moscow. Its official news agency, TASS, although with one of the few correspondents in Kampala during Amin's fall, could write no more than two short paragraphs on the fall—and that, too, anaesthetic quotes taken from the Western press.

This left Amin with his secondary allies, mainly the reactionary Arab regimes. Unlike the superpowers, Libya had less room for manoeuvre. It sought a middle ground—mediation—but could find none in a polarised conflict. Seeing the world mainly in terms of the Arab-Israeli conflict, Gaddafi came to the rescue of the demagogic anti-Zionist Amin with troops and equipment. But in a terrain they did not know and in a war whose meaning they did not understand, these young and aged sons of the earth—cannon-fodder in every reactionary army—faced a walloping defeat at the Battle of Entebbe. Those not captured were soon withdrawn. Amin's last days had begun.

Defeat

We return to our original question. Though left in the lurch by superpowers who had patronised him all along, with none but secondary allies to support him, why did Amin's military machine, built with all the resources the dictator could muster, disintegrate after the first test of battle? We can now bring together the threads of our analysis to answer the question.

First, the character of Amin's army. From the massacres of late 1971 and more so from 1975-76, the core of Amin's army were southern Sudanese and Eastern Ziarois, mercenary elements who remained to gather hay while the sun shone. The Ugandan elements in the army were predominantly recruited from the riff-raff of the towns, mainly Nubian. A marauding force used to medieval savagery to silence and strip a defenceless civilian population, it had no battle experience. At Masaka and Mbarara, and particularly at the Battle of Lukaya, Amin's army found out that it was one thing to harass unarmed civilians, quite another to face the armed forces of another State.

But that was not all. The army was

wrought with internal divisions from 1976 on. Officers had been recklessly transferred, demoted, dismissed and killed. Such a state of affairs hardly augured well for the discipline of the troops. It was a ragtag army that entered battle against the anti-Amin forces.

What Amin did have was military hardware, a lot of it new and very impressive. As many a field commander remarked, with their tanks and armoured cars Amin forces were confined to roads. Against long-range Tanzanian artillery, as against the ambush of infantry in bush country, Amin's army turned out to be as specialised as a dinosaur. At the first sign of defeat, the soldiers abandoned their new equipment and fled the Ugandan elements to shed their uniform and melt away in the local population, and the non-Ugandan mercenaries to roam the countryside as bandits until finally rounded up or killed.

The medieval savagery which had been the hallmark of the regime all along was also characteristic of its dying gasp. Not only that. When the anti-Amin troops entered Kampala, they found huge caches of arms from the USSR, Britain, Israel and Spain—all unused. In the final analysis, it was not the quantity of weapons but the quality of the organisation wielding them that mattered. Amin had demonstrated an important truth, though by negative example. In war as in all realms of social activity, it is not the technical but the political factor which is decisive.

REVIEW ARTICLE

Grand Conceptions of Supply-Demand Theory

A K Mallik

Classical Political Economy and the Rise to Dominance of Supply-Demand Theory by Krishna Bharadwaj; Orient Longmans, New Delhi, 1978; pp 106, Rs 14.

RECENT revival of interest in classical political economy challenging the neo-classical orthodoxy started on the analytical issues in value-distribution theory. Krishna Bharadwaj, in this series of lectures, attempts to view the two schools of thought in a much wider perspective. The transition from classical political economy to the demand-supply theory is viewed as a fundamental change in the vision of how the economic system works, ie, a transition at the level of ideology having its roots in the broader history of social movements. The methodological implications of this shift are then viewed with respect to the ability of the new theories to deal with a greater or lesser variety of observable change. On the one hand, theory as ideology and on the other, theory in relation to the problem of change, provide the overall perspective — the former for locating the origin or history of two streams of thought and the latter for evaluating their analytical power. Analytical problems in value-distribution theory are seen to fall into their proper places within this broader frame.

Appreciation of Krishna Bharadwaj's effort is not intended to suggest that the recent works on the logical foundations of classical value theory are without any sense of perspective. As acknowledged by the author, the present book owes a lot to Piero Sraffa's writings. The suggestion of an overall perspective, especially in regard to the point of view of change, was implied in Sraffas work. Nevertheless, an explicit discussion on the classical method of dealing with change was not within Sraffa's immediate interest in the analytical frame of value-distribution theory. The present book with its explicit concern for a total perspective, therefore, looks useful.

While agreeing with the basic theme of Krishna Bharadwaj's lectures, a few comments may be relevant on some of the points of detail raised in course of her discussion. The first lecture tries to bring out the difference between the two theories at the level of ideology and to trace their historical roots. The dividing line is drawn in the beginning (p 11) in terms of "production-relations" *vis-a-vis* "market-relations". "The primacy of production-relation in classical political economy" was replaced by "market-relations (or relations in circulation)". The discussion which follows centres upon 'the major problems and conceptualisation' of classical political economy where one gets the following picture. The concept of labour as the source of production enables one to make the distinction between labour and different forms of property as qualitatively distinct bases for claims on the social produce. The recognition of alternative bases of income leads to the concept of social class as the unit of analysis. Finally, class-relations are viewed as essentially antagonistic in nature. The demand-supply theory, on the other hand, views production as a process of transformation of factors of production the supply of all of which involves some subjective cost on the part of their owners. The concept of subjective-cost puts all types of claims on the social produce on a uniform basis and thus, eradicates the grounds for any class-distinction. The individual emerges as the unit of analysis with market as the only institution relating the anonymous individuals.

A question which arises is whether any mode of expression of antagonistic class-relations can be viewed as equivalent to production-relations. In Smith, for instance, the master-worker relation is viewed as bargaining relations. The bargain for wages is between unequal social classes and not between equal individuals. This inequality, Smith locates, in specific property bases. There is also the recognition that the dominant classes manipulate the state policies in their favour. But in Smith, there is no concept of 'production relations' in the sense of relations viewed from the standpoint of organisation of labour process within a production unit. While the basis of wage-labour is rightly located in property, the essence of wage-relation is not located in the capitalist's control over labour-process, ie, in the technology and work organisation of factory production. Social organisation of production is discussed in a general frame of division of labour. The sequence is from division of labour to the necessity of stocks in production to privately-owned stock or capital. Capital labour relation thus manifests only at the level of bargaining that determines the distribution of social produce. State power is viewed as strengthening the bargaining position of the masters.

One can, of course, understand the author's position. She is viewing theoretical development from Petty to Marx as a single tradition. The common concepts of labour-based production, property, social class and antagonistic class-relations are sufficient in differentiating the work of all these economists from the demand-supply approach. But her frequent and un-

qualified use of the term 'production-relation', perhaps, opens up a potential source of confusion. Antagonistic class-relation as a generic category with production-relations as a specific way of looking at class-relations, is useful in relating the works of different classical economists to their immediate historical context and purpose. Smith and Ricardo, for instance, were writing in the period of the emergence and consolidation of the capitalist order. Capital-labour relation was not their immediate concern. Dominance of older form of class-interest was manifest in state-policies like the mercantile regulations or the corn law. The main concern of political economy was to analyse the proper role of the state for the functioning and growth of the new production-economy. The relation between the stages of production, property and State was discussed at length by Smith. The functioning of a feudal agrarian economy requires that the propertied class must control the rest of the population through the use of political-power. But in the commercial stage of production, the state is needed only to protect property. The functioning of the economy can be left to the self-regulatory principles of commerce. The overall picture that emerges is that in a class-divided economy, either the dominant class must have a control-instrument at the political level or that it does not require any explicit control mechanism once the self-regulatory principles of commerce emerge. The stress is on the element of personal freedom under capitalism, although the basic background of an unequal class structure is not denied.

Marx, on the other hand, was focusing on the capital-labour relation in the post-Factory Acts phase. The Factory Acts were a progressive state legislation. But along with it, intensification of labour through the use of improved machinery emerged as the main instrument of labour-exploitation at the level of production. The concept of production-relations was meant to demystify the nature of class-relations by dislodging the state from its position of primacy in relation to class control and domination. The emphasis was on the autonomy of the capitalist production-economy with the instrument of control and command embedded at the level of production. 'Capital' was in this sense, a critique of 'Political Economy'.

At the level of ideology, the transition to a demand-supply theory is viewed as an effort to legitimise the claims of capital on social produce and to present a harmonious picture of the capitalist order against the trend of socialist movement. The labour theory of value, which the socialists used in their campaign was chosen as the explicit target of attack. The author cites numerous passages from the writings of the new economists which contain a clear expression of their motivation. In the context of ideology, she might as well have included a point that she discusses in the lecture on method: the resemblance between the theories of classical mechanics and the demand supply theory as a consciously chosen element in theory construction. Ideology, in the broadest sense of the term, implies a viewpoint When the tools and methods employed in one field of science are transplanted as a viewpoint in other fields, the scientific method becomes hardly distinguishable from ideology. This viewpoint method distinction might have been clear to a serious thinker like Marshall. He clearly recognises that mechanics cannot yield a viewpoint in economics but can only be used in the logical exposition of a viewpoint.

The same attitude, on the other hand, might not have been shared by others and it is very likely that the methods of méchanics provided the viewpoint in fixing the range of problems amenable to 'scientific' treatment in economics Enthusiasm for this kind of 'scientific' ideology, probably played an important role in the case of a Walras and his modern followers. As a result, the logical apparatus operates as a self-sufficient and neutral model while its real basis in a particular viewpoint is effectively disguised.

Coming to the problem of change, the author makes a distinction between 'quantitative' and 'qualitative' change. By this, she probably means the distinction between change within a system, more specifically, change within 'capitalism' (correspondingly, the market system in neo-classical theory) and change in the relational structure of society or social transformation. The treatment of the first type of change in the two theories is posed around the respective value theories. Neo-classical economics with its marginalist approach to value theory is required to introduce hypothetical change within the realm of the value problem, and also to put restrictions on the direction of these changes, in order to build up a consistent theory of price-equilibrium. Logical difficulties in accommodating phenomena like increasing return or re-switching of techniques arise precisely from this source. The classical theory of 'natural prices' or 'prices of production', on the other hand, looks for a set of prices consistent with a uniform rate of profit in all sectors on the assumption of given levels of sectoral output, given methods of production and a given real wage-rate. Changes in the variables treated as parameters for the value problem are analysed at a different level, because the forces governing them are different from forces governing the price-equilibrium. The problem of change thus provides the proper perspective for locating the formal analysis of the logical inconsistencies of neo-classical theory as well as of the logical foundations of the classical theory of value.

In identifying the location of forces of change in classical political economy, Krishna Bharadwaj has drawn mainly upon Marx. Unfortunately, there appears to be a misspecification of forces as one goes on. She relies primarily upon the Introduction to the "Grundrisse" for her purpose. But the primacy of production in the organic unity of production, distribution, circulation and consumption is too general a theme to throw light on the specific forces and the nature of changes within capitalism. The really relevant discussion for this is to be found in the chapters on accumulation in 'Capital' which the author, unfortunately, does not exploit. The primacy of production thesis, on the other hand, can serve as the basis for analysing changes in the relational

structure of society, or for economic history in general, which is Krishna Bharadwaj's concern in her last lecture.

Returning to the question of changes within capitalism, it is proper to start with capital. Capital as a form of private property is defined by the unity of the process — capital-profit-accumulation. In capitalism, the process operates on the basis of wage-labour and logically leads to definite changes in the scales and methods of social production and in the wage-rate. The force of accumulation governing these changes is different from the force which governs prices of production. A system defined by capital and wage-labour is thus a system of endogenous change. A system defined by the market, on the other hand, does not have an internal force of change. The force of change is replaced by choice, and the investigation centres on how exogenous forces lead to the displacement of variables in an interrelated system.

The last lecture deals with the problem of social change. Change in circulation-relations and change in production-relations are posed as alternative frames of analysis. The production-relations approach is considered to be a more general approach, because the sphere of circulation is secondary to that of production. Circulation requires as a precondition a well-developed system of division of labour, and any potential extension of the circulation network is effective only *via* a proper response from the sphere of production. While the primacy of production over circulation can be argued in general terms, social change without any specification of time and space is, perhaps, too complex and varied to be organised within such a general frame. Consistent with the theme of the book, the author could have centred the discussion around the transformation of medieval Europe into an industrial society. The significant point is whether one characterises industrial society as capitalism or as a market-system. The logical basis of the concept of capitalism, generalised as production-relation, fixes a certain way of looking at the medieval economy from the point of view of the internal organisation of its production-units. The process of transformation is, then, the transformation of the medieval-type production organisations into capitalistic units of production. On the other hand, the logical basis of the concept of the market, generalised as circulation-relation, gives the corresponding category of revenue-economy and the corresponding frame for viewing the process of transformation. The analytical abilities of the contending frames can, then, be judged in terms of their flexibility in interpreting a wider variety of historical experience for the relevant period. In this context, it is also to be noted that the specific concept of production-relations gives a complete frame of the transition from feudalism to industrial revolution. Smith's theory of transition based on the growth of manufacture and the consequent division of labour between the town and the country concentrates solely on the dissolution of feudal bondages and the rise of free commercial relations.

The works of Karl Polanyi and J R Hicks are specifically focused as illustrations of approaches to economic history from the point of view of the institutional aspects of trade and market. Hicks in his "Theory of Economic History" attempts to build up a connected story or a process leading upto the industrial revolution. The basic limitation of Hick's approach has been correctly pointed out. It recognises only one type of social conflict, that between merchants and the non-mercantile authority, as the dynamic force in the process of transformation. The conflict between landlord and serf, that between production and mercantile capital, and the position of the state in relation to these conflicts, are totally glossed over. As a consequence, the approach fails to explain different patterns of evolution in different economies integrated with developed systems of trade and commerce.

Polanyi appears less important from the author's viewpoint, for he abstracts totally from the process of change. But Polanyi, perhaps, is more consistent within his own objectives. The rules governing livelihood activities, or the processes of production, distribution and circulation, give the analytical category of the economy as an instituted process. Polanyi's concern is to locate the place of the economy in society as reflected in the consciousness of the participants in the social process. The market, and economising or money-making, are how people in industrial society perceive the economy. The separation between economy and society is not only analytical but also real. The distinction appears more analytical and less real as one moves back in history. Mercantile or capitalist trade is important in the sense that it marks the origin of the attitude of money-making that finally leads to the real separation between economy and society. This way of linking trade and industrial society is, perhaps, less objectionable than over-stretching the link to yield a dynamic process of change.

One may sum up the position as follows. In the present book, Krishna Bharadwaj's main concern is to view critically the grand conceptions of the supply-demand theory. The most important points that distinguish the demand-supply approach from its preceding theoretical tradition have been discussed very clearly. First of all, the approach attempts to eradicate the labour-property distinction on the basis of the concept of subjective-cost. Secondly, equilibrium-constructions based on the marginalist technique unnecessarily constrains the analysis of change. The present reviewer has difficulties mainly on two points with respect to the organisation of the theme of the book. The author has not been sufficiently careful to avoid the possible sources of confusion regarding the relation of Marx's conceptual frame to the rest of classical political economy Secondly, no clear-cut demarcation is made between the specific forces of change within capitalism and the theory of social change. Needless to add that these point are of a minor order from the point of view of the core-theme of the book. The author had to cover a 'vast territory' and the method of organisation can never look totally closed. This openness around a core-theme is what makes the book stipulating to readers.

Small Farmer Development

Raj Krishna

The economic philosophy which led up to the launching of the Small Farmer Development Agency (SFDA) scheme in 1971 is simply that special preferential arrangements are necessary for the supply of inputs to small farmers because the markets for inputs (and particularly credit which is the precondition for access to all material inputs and equipment) are imperfect and non-neutral. They discriminate systematically against the small producers both in respect of the quantity of inputs (credit) supplied to them as well as the price at which (or more generally the terms on which) they are made available to them in comparison with larger farmers.

Even the establishment of a vast State-supported co-operative network, and the nationalisation of commercial banks did not automatically reduce this discrimination. Therefore, the planners concluded eight years ago that special agencies of small farmers were needed to lobby for them even with nationalised and co-operative institutions.

Since seven years of experimentation have elapsed, it is essential to review the philosophy and the performance of the SFDA set-up. This paper offers some evaluative reflections on the SFDA approach and some suggestions for its further evolution.

THE economic philosophy which led up to the launching of the Small Farmer Development Agency scheme[1] in 1971 is simply that special preferential arrangements are necessary for the supply of inputs to small farmers because the markets for inputs (and particularly credit which is the precondition for access to all material inputs and equipment) are imperfect and non-neutral. They discriminate systematically against the small producers both in respect of the quantity of inputs (credit) supplied to them as well as the price at which (or more generally the terms on which) they are made available to them in comparison with larger farmers.[2]

Even the establishment of a vast State-supported co-operative network, and the nationalisation of commercial banks did not automatically reduce this discrimination. Therefore, the planners concluded eight years ago that special agencies of small farmers were needed to lobby for them even with nationalised and co-operative institutions. In order to induce institutional lenders to lend to small farmers the agencies were to operate not only as lobbies but also as guarantee agencies. And to reduce the cost of asset acquisition by small borrowers the agencies were also to administer asset purchase subsidies (to the extent of 25 to 33 per cent of the value of assets).

Since seven years of experimentation have elapsed, it is essential to review the philosophy and the performance of the SFDA set-up. This paper offers some evaluative reflections on the SFDA approach and some suggestions for its further evolution.

THE SMALL FARM SECTOR

For a proper assessment of the scheme it is essential to bear in mind the contours of the whole small farm sector. The share of this sector in the total availability of vital inputs needs to be examined.

According to the Agricultural Census of 1970-71 nearly 70 per cent of rural households had operational holdings of 5 acres or less, and 51 per cent had 2.5 acres or less. Since the number of holdings reported by the Census was 70.49 million, these ratios imply that about 49 million holdings belonged to the category of small farms, of which 36 million were marginal farms. As for landless workers their number has been estimated in the Draft Plan 1978-83 as 50.4 million in 1971.

But whereas 70 per cent of operational holdings were small, they accounted for only 21 per cent of the operated area.

However, we find that their share in the net irrigated area (31.4 per cent) was higher than their share in the total cultivated area (20.9 per cent)

NSS[3] data, collected in the 26th Round, also show that the share of small farms in total fertiliser use was 32 per cent.

As regards credit, if we combine the data about the distribution of agricultural credit given by commercial banks, co-operative societies and land development banks, the share of small farms in total short-term, medium-term and long-term agricultural credit turns out to be 33 per cent in 1975-76

In the totality of farm assets, the share of small farmers is found to be 34.5 per cent according to the Reserve Bank Debt and Investment Survey data for 1971-72.

Thus, it is remarkable that though the share of the small farm sector in cultivated area is only 21 per cent, its share in all the important inputs, namely, irrigated area, fertiliser consumption, institutional credit, and total assets is around one-third in each case. This means that small farmers, as a class, command more productive assets and inputs per unit of land than large farmers. But, of course, since they constitute 70 per cent of agricultural households, assets and input availability *per household* is less in the small farm sector than in the large farm sector. As a result, income per household, and even more, income per capita, is less in the small farm sector.

These macro relationships are consistent with the findings of micro studies suggesting that small farmers apply more input per unit of land than large farmers. But poverty persists in the small farms because they support a much larger population per unit of land.

The fact that input per hectare is already larger on the small farms than on large farms is no cause for complacency. We cannot use this fact to argue that further intensification of input per hectare is not necessary. On the contrary, input per hectare has to be increased until the gain in productivity per hectare permits income per head to be raised to the poverty line or above it. This must be the main policy for reducing poverty in the small farm sector because a substantial enlargement of the average holding size is ruled out by overall demographic pressure and the difficulty of reducing the share of agriculture in the labour force. This share has remained stuck around 74 per cent for at least 56 years (1921 to 1978) in spite of considerable industrialisation since the 50s. Even during the decade 1961-62/1971-72, population pressure reduced the average size of the operational holding in India from 2.6 hectares to 2.2 hectares. Thus the small farm structure is destined to remain with us in India for a very long time. And there

is simply no alternative to the maximisation of productivity per hectare, and hence per capita, within this structure, through increasing input intensification. The enormous unrealised productivity potentials of small farm agriculture have to be realised in the shortest possible time.

This policy imperative requires that a programme concentrating on the supply of credit, inputs and knowledge exclusively to small farmers should get the highest priority in the anti-poverty strategy.

COVERAGE

When the coverage of the SFDA scheme is examined in relation to the size of the whole small farm sector, it appears that the participants identified over 8 years up to September 1977 (13.056 million) comprise a little over a quarter of the small farm households.[4] The number of beneficiaries was much less: 6.448 million, or about one-eighth of the number of small farm households, even if we assume that every beneficiary registered as a member of a co-operative obtained credit, and there was no double-counting of beneficiaries under different programmes. It is clear that the proportion of small farm households identified remained small, and half of even the identified households were yet to receive any benefit. If the number of beneficiaries grows by 1 million a year, the programme would require 43 years to cover the present target population of small farmers, not to mention the increase in it. Therefore, an additional annual coverage of the order of 4 million seems to be necessary if the bulk of small farmers are to be reached within a decade. This would, of course, require that the SFDA scheme be extended to all the districts of the country in a short period of time, and its operations accelerated everywhere.

The definition of small and marginal farmers involves important theoretical and practical issues. The present definition specifies 5 acres of dry land as the cut-off point for identifying small farmers and 2.5 acres of dry land for identifying marginal farmers. Equivalents of these areas in terms of irrigated land are supposed to be computed by the agencies by using the conversion factors specified in the land ceiling legislation of every state. Many questions can be raised about *any* definition. But the present definition seems to me to be acceptable for practical purposes. There are two main questions we have to ask about any definition: (1) Does the definition bring within the scope of the scheme the major part of the universe of small farm poverty? (2) Does the farm as defined provide the minimum land base which can be made to yield the poverty-line income to the operating household with adequate technical and financial assistance for crop production as well as supplementary activities? The answer to both these questions is clearly affirmative. Landless labourers and farmers with dry land less than 5 acres do constitute the hard core of the rural poverty population. And it has been demonstrated by the SFDA as well as other schemes that irrigated agriculture, even on a one-hectare land base, combined with animal husbandry, fishing, forestry and/or rural industry can support a small farm family at or even above the poverty line income.

The total budgetary amount released for the scheme since its inception up to September 1977 was Rs 134.31 crores, the amount utilised being Rs 123.59 crores. Budgetary support, however, is not the main indicator of the magnitude of the scheme. The more important indicator is the additional credit which the agencies were able to secure for small farmers. The amount sanctioned up to September 1977 was Rs 243 crores, the amount released Rs 131 crores and the amount utilised Rs 124 crores (MAI 1978). The amount released averages only about Rs 200 per beneficiary. But without the lobby-guarantee-subsidy system of the scheme, the small farmers, on their own, could not have secured even this much additional credit.

It is also significant that only 14 per cent of the total credit disbursement has been short-term crop credit. The remaining 86 per cent has been medium and long-term credit for the purchase of productive assets. It cannot be overemphasised that a small farmer programme must be an asset delivery programme rather than a mere short-term relief or credit arrangement. For only the acquisition of new assets will yield a permanent flow of additional income to the poor, and bring about some redistribution of the means of production at the margin. From this point of view the dominance of asset credit in loan disbursement is a welcome development and must be maintained.

INCOME

The most significant test of the success of any scheme of preferential and subsidised supply of assets and inputs to weaker sections of the population is the additional net income per household generated by the supply.

Some evidence about the additional income generated by the scheme for beneficiary households has been collected at an aggregative level by the Programme Evaluation Organisation of the Planning Commission (PEO 1978) for the early years of the scheme, and at the micro level by other institutions.

PEO data show that in the 34 projects studied assistance under the scheme generated an additional annual income of Rs 1017 per beneficiary family in 1973-74. Minor irrigation assistance yielded Rs 1670 and dairy assistance Rs 829 as extra income per household. Income increases of this order are significant if we recall that the rural poverty line in 1973-74 prices would be about Rs 3000 per household. The additional income is nearly one-third to one-half of the target income. The income effect of agricultural and irrigation assistance was positive in 32 projects and of dairy assistance in 30 projects out of the 34 surveyed.

There is one project district (Vishakhapatnam) in which the reported income of non-beneficiary households was found to be higher than that of the beneficiary households. In that district, beneficiary households earned Rs 2580 and non-beneficiary households Rs 3480 per annum (in 1973-74).

Apart from the PEO study, a study of the Cannanore project by George and Chirayath (1978) concluded that:

> the average annual income of a beneficiary household was higher by 34 per cent, the household income being Rs 3447 in the case of beneficiaries and Rs 2580 for non-beneficiaries ... The average annual net income of beneficiary small farmers increased from Rs 1951 before implementation of SFDA scheme to Rs 3447 after implementation, registering an increase of 77 per cent.

S M Pandey (1974) has reported that in Mathura district (UP), only 5 per cent of beneficiary marginal farmers remained below the poverty line after the implementation of the scheme whereas among non-beneficiaries one-third were below the poverty line.

In one village (Nishana) in the Surat district of Gujarat SFDA assistance enabled 73 members of a milk society to acquire 103 buffaloes at a subsidised price. These members received a net sum (value of milk delivered minus loan adjustment) ranging between Rs 1600 and Rs 4100 per year. The members were given one or two buffaloes each. (72 per cent of the population of this village is tribal.) (NWSF/N1978.)

In another village (Mubarakpur) in Haryana, the SFDA scheme enabled 7 landless artisan families to increase their net combined income from Rs 9800 a year to Rs 21000 a year from the manufacture of *moodhas* on a co-operative basis. Thus the average income per beneficiary family from rural industry alone increased from Rs 1400 to Rs 3000. This industry employed beneficiaries for 200 days in a year. (NWSF/M 1978.)

A few other bits of income increase data derived from case studies are given in the Table.

The evidence leaves no doubt that wherever irrigation and dairy assistance is given, with access to technical help and

TABLE: ADDITIONAL BENEFICIARY INCOME DUE TO SFDA SCHEME

No	District/State	Year	Assistance	Additional Annual Income/ Beneficiary Household (Rupees)	Total Income After Receiving SFDA Assistance (Rupees)	Source of Data

marketing, increases in income per beneficiary household of the order of 75 to 300 per cent have been achieved. And the beneficiaries have either crossed or risen close to the poverty line. Thus the two programmes of minor irrigation assistance and animal husbandry assistance have proved their merit as sure income-raisers for small and marginal farmers. These results have validated the essential concept of the SFDA scheme that small farm households can be relieved of poverty if productive assets are delivered to them, and their new activities are linked with support systems. The main problems, then, which need to be attended to are problems of inadequate coverage, administrative apathy and laxity, and the failure to organise support activities.

SOME ORGANISATIONAL ISSUES

So far as coverage is concerned we have already noted that the SFDA scheme deserves to be extended to all districts over the next few years.

However, the extension of the scheme to other districts should be a part of a larger process, namely, the merger of all area-oriented schemes (the DPAP,[5] the CADP,[6] and the Desert, Hill and Tribal Area programmes) into a single Area Development Programme. The aggregate provision for all these programmes in the Draft Plan 1978-83 is Rs 2800 crores, excluding institutional finance. (Planning Commission 1978, p 20.) A look at the list of activities for which assistance is available, as well as the pattern of assistance for each activity, under these various schemes, would show that the differences are insignificant and the unification of all schemes can be easily achieved. (MFA 1978.) This would pool large resources, and simplify the task of the aid-givers as well as the aid-seekers. The particular mix of activities promoted will, of course, differ from area to area.

The area orientation and the target-group orientation are inseparable. The area orientation has been necessitated by the deficiencies of a purely sectoral approach to rural development. Similarly, the target-group orientation is essential because of the general tendency of untargeted programmes to carry benefits mainly to the large farmers. Thus, ideally, all rural development programmes in the coming years should become area-oriented as well as target group-oriented.

A major limitation of the present SFDA programme is that it places an additional burden on the extension staff on account of the additional servicing of small farms. Since the extension staff has not been increased for this purpose, the present staff neglect SFDA work or give it only partial and irregular attention. In areas where the main assistance given is for wells, pumps, tanks, etc, extension assistance is critical for enabling the beneficiaries to shift from dry to wet agriculture and to new crop combinations. But the problem does not require a mere expansion of the extension staff, though expansion should be provided for wherever necessary. Partly the solution lies in rescheduling the work of the present extension staff itself. It is obvious that if the present staff can give no attention or very little attention to small farmers, they must be devoting most of their time helping big and medium farmers. This division of their time is clearly irrational in view of the new priorities. And we must consider directing the extension staff to devote at least half of their time to the servicing of small farmers.

Since credit is the key to small farm development, the ratio of institutional agricultural credit going to small farms (which is currently one-third) also needs to be raised to at least 50 per cent in the coming years. In principle, large farmers should have very little claim on the institutional credit provided by the public sector. They should draw most of their credit needs from their own substantial surpluses (which are usually lightly taxed, if at all) or from fully commercial private credit.

One of the most welcome recent developments is the expansion of rural credit by the commercial bank system. The data show that on June 30, 1977 the commercial banks accounted for about 29 per cent of the total institutional finance to agriculture (Rs 4596 crores outstanding). (Desai Committee 1978, p 10.) The number of commercial bank accounts for small farmers had risen to 2 2 million by 1977. In fact, 67 per cent of all agricultural accounts are now small farmer accounts. (Ministry of Finance, 1978.)

The importance of this development arises from the desideratum that in an agricultural country agricultural lending should not remain a marginal system; it should rather be an integral part of the mainstream of banking. Although lending to agriculture brings lower returns than

lending to industry and trade, rural lending should not be kept segregated in a subsector. For institutions with a large high-return turnover can bear some low-return turnover more easily than institutions forced to specialise in low-return turnover.

Since many orthodox bankers continue to be hesitant about small farm lending they need to be reminded that yield increases of the order of 100 to 200 per cent above present levels are feasible with the modern seed-water-fertiliser technology. (Singh 1978.) Cereal yields can be raised from less than 1,000 kgs per hectare to 2,500 kgs in the case of rice, and 4,000 to 5,000 kgs in the case of wheat. And pulses and oilseed yields can be raised from 600-700 kgs per hectare to 1,000-1,500 kgs per hectare. Also, there is considerable evidence that the technology adoption rates in the small farm sector are very high if research, extension and input delivery systems perform. Moreover, under irrigated conditions marginal physical output-input ratios of the order of 10 or more, for fertiliser nutrient inputs, are quite common. Financial return-cost ratios for fertiliser use lie between 2 and 3.7 for paddy and 2.9 to 4 for wheat. (FAI 1978.) These facts make investments in modern seed-water-fertiliser technology fully justified from a strictly financial point of view. In fact, small-scale irrigated agriculture, with contemporary technology, yields higher returns than many small-scale non-agricultural enterprises.

When medium and long-term investments are considered, the return prospects are equally attractive. On the basis of a large number of professional studies of returns to net farm investments, the Agricultural Refinance and Development Corporation of India (ARDC) has found that the financial return to minor irrigation investments ranges between 20 and 50 per cent. The return to land development in command areas of irrigation systems exceeds 50 per cent. The return to dairy-buffalo units also exceeds 50 per cent. The return to mechanised fishing boats ranges between 20 and 25 per cent and the return to investment in citrus, coconut, pepper, cashew and rubber investments ranges between 18 and 49 per cent. The social return is of course much higher in all these cases. Because of these high returns the ARDC has been able to double its refinance disbursements within three years (1974-75 to 1977-78) from Rs 1 billion to Rs 2.3 billion and is now programmed to increase disbursements to more than Rs 9 billion by 1982-83. More than half of ARDC refinance is intended for small farmers. (ARDC 1978.)

It is thus clear that the financial profitability of medium-term and long-term investments on small farms is no less than that of current input investments.

One cannot help thinking that the credit starvation of the small-farm sector symptomises a vicious circle. The sector is considered unproductive and therefore sufficient investment is not made in it. But it remains unproductive because sufficient investment is not made in it in spite of the fact that substantial productivity and profitability potentials exist and remain unexploited.

It seems that a vicious circle exists not only with regard to the deficiency of total investment in small farms but also in respect of the riskiness of investment. Riskiness of small-farm investments is mainly due to yield instability. Yield instability is in turn mainly due to inadequate inputs of HY seeds, irrigation, water control, pest control and fertilisers, and the absence of multiple cropping. Optimal investment in these inputs can stabilise yields. Again, therefore, we observe investment remaining inadequate because of its riskiness, and riskiness remaining high because of inadequate investment. Only a big investment thrust, with a matching technological, extension and delivery back-up, can break the vicious circle.

The recent relaxation of the terms on which credit is given to small farmers by the banking system is also a very welcome development. The new concessions include the grant of small loans up to Rs 5,000 against personal security and/or simple hypothecation of assets created out of the loans, a crop guarantee system to deal with cases in which landed or personal security is not available, extended periods of repayment for small and marginal farmers, the elimination of the margin money requirements, and a lower rate of interest between 8½ per cent and 11 per cent on loans up to Rs 2,500. (Ministry of Finance, 1978.)

These concessionary terms of lending embody the two principles which have been canvassed by researchers for a long time, namely, (1) that in the case of short-term credit to buy modern inputs the expected additional income itself should be the basis and the security of the credit given, and (2) that in the case of medium-term and long-term credit for the purchase of assets, the hypothecation of assets, rather than landed security, should be acceptable as collateral.

But there are many reports to the effect that in spite of the clear-cut policy laid down by the Reserve Bank the field officers of banks in many areas are still insisting on landed security. It is to be hoped that the Reserve Bank would make the new policy effective throughout India.

Many studies have brought out the fact that the success of a credit operation to develop any rural activity requires a minimum simultaneous development of other activities which are linked with the main activity on the input side and the output side. To stress this point one cannot do better than to quote R K Hazari, an ex-Deputy Governor of the Reserve Bank of India:

> We financed ... fishing boats ... the project nearly came to grief because there were no ice plants and no cold storage facilities. There were no trucks to transport fish ... When it came to financing of market yards the earlier view was that ... all we had to do was to ... finance the construction of buildings ... Now, we also go into the question of fixing market fees, the kind of building material to be used for the market yards, as also the proper management of the market committee ... [In a] scheme for plantations, ... material ... readily available [was to be used] ... This would have meant ... that for the next sixty to eighty years the small planters would have been burdened with sub-standard bush. We insisted that the plantation programme would have to be delayed till first class planting material could be made available ... When one is financing dairies, one is not just financing the distribution of animals or the setting up of dairy plants ... One should ... know that cattle are going to be good and that cattle are available and that the same cattle are not being passed on from one farmer to another ... There has to be adequate veterinary care, ... adequate feed ... and ... the milk has to be sold ... and the money collected ... and returned to the lender ... In the case of poultry there is the celebrated case ... where very recently born chicks were distributed to farmers with the inevitable consequence that the chicks died. (Hazari 1976.)

Every credit executive can recall scores of such instances in which insufficient provision for the availability of linked inputs, and knowledge, results in failure. The cases cited by Hazari relate to loans for fishing, market-yards, plantations, dairies and poultry units. But the argument applies equally to crop loans, irrigation loans and equipment loans. Successful crop credit and irrigation credit require effective extension and input deliveries. In command areas the return from heavy investments in dams and canals cannot be realised without complementary investments in field channels, drainage and infrastructure. If credit is supplied for equipment, diesel supplies and/or electricity connections, repair services and the supply of spare parts must follow. And, in general, lending for any bankable productive activity can fructify only if three basic infrastructure facilities—water supply, energy and transport—are available.

All these linkage requirements point to the need for rural credit programmes being tied to integrated area planning. Where an area-oriented credit programme is undertaken, and linked facilities become available, the overriding objective of financial institutions should be "Saturation Lending". This concept simply implies that every single feasible, bankable scheme of every single poor household or establishment in the target area should be concretely formulated and financed. The radical content of this

concept is that instead of giving *some* loans in *some* areas to *some* people who apply for them, the financial institution redefines its function as that of reaching out, on its own initiative, to formulate, to finance and to secure necessary complementary help for all the viable schemes of all the poor households of an area. In other words, the role of the lender is not to lend passively to applicant borrowers but to chase all the potential small borrowers of an area and to see that they get all the credit they can use productively.

This notion can be seen as the transplantation on to the national scene of a principle with which international development banks already try to operate. They do not wait for projects to come from applicant governments. They send out their own expert technical teams to prepare projects for the borrowers, using their expertise as well as all available local knowledge, appraise and process the projects; and negotiate and deliver the loans. Banking for the poor within every developing country will also have to become borrower-chasing banking in a similar way. It has to be realised that if the poor knew all the technical possibilities, knew how to prepare feasible, bankable schemes, and knew how to do the paper-work, the leg-work, the lobbying and the bribing required to get loans, they would not be poor. Therefore, whatever needs to be done to get a loan has to be done for them by the lenders themselves. This concept often shocks bankers who are used to sitting in cosy offices and leisurely receiving and processing the loan applications of the affluent. But without a revolution in their attitude which makes them act almost as borrowers as well as lenders, sufficient credit would never reach the poverty-stricken masses.

Once the new attitude is imbibed by bankers, they would have to re-examine and refashion all their procedures to suit the small man. Branch expansion would have to be accelerated. Co-operatives or service associations or informal groups will have to be set up and used as agents, so that the cost of rural credit administration is kept down. Paper-work will have to be simplified. Procedures to obtain land title certificates, encumbrance certificates, other liability certificates, mortgage registrations etc, will have to be streamlined. In fact, all the paper-work for small borrowers will have to be done either by the credit staff themselves or other official and non-official agencies acting as lobbies for them. Much better inter-agency co-ordination will be required so that all agencies deliver and/or register the required documents with speed. Staff selection criteria and incentives will have to be redefined so that the field staff are either locally recruited or find it attractive to stay close to the rural areas they serve. They would have to be retrained so as to acquire adequate knowledge about the technology of the activities for which they lend, the practice of scheme-formulation and appraisal, as well as the lending procedures. Above all, they must be helped to imbibe a deep empathy for the poor by observing the work of dedicated social workers in "success" areas.

In order to reduce risks, both for borrowers and lenders, increasing experimentation is necessary with crop, cattle and asset insurance schemes, particularly in areas where the development of irrigation and pest-control has reduced the variance of yields to an acceptable level.

Perhaps the most critical determinant of the success of a credit programme is the techno-economic quality of the schemes for which money is loaned. The biggest continuing lacuna in our administrative system is the absence of competent techno-economic scheme-formulation bureaus at the smallest administrative unit levels. Wherever government agencies have failed to establish such bureaus, the banks themselves will have to set them up. In addition, a whole profession of private rural consultants needs to be created and expanded. These will be certified agencies who specialise in making techno-economically sound, small schemes for specified areas and sectors or groups of households for reasonable fees.

For an efficient credit system, as for any other "system", constant feedback is necessary to facilitate course correction or "learning by doing". At present our rural development reporting system only produces some statistics of input or credit deliveries. These statistics are manifestly inadequate. What policy-makers want to know, most of all, is the income and employment effect of individual schemes, and groups of related schemes, in each area. It is, therefore, urgently necessary that standard NSS schedules be used for surveying and reporting on the consumer expenditure and employment status of rural households on a two-yearly or three-yearly basis in all blocks where intensive credit programmes and/or related rural development programmes are operating. In addition, academic institutions must be mobilised everywhere to take up the qualitative as well as the quantitative evaluation of important development programmes in the neighbouring rural areas on a continuing basis.

The low repayment rates for small-farm loans is a matter of continuing anxiety. The principal fact to be remembered in this connection is that a low recovery rate is not a necessary concomitant of small-farmer lending as such. There is evidence to show that the overdue rate of small farmers is only slightly higher than that of large farmers. In a 1972 official survey overdues of large farmers were found to be 63 per cent of their outstanding borrowings from co-operatives. The ratio for small farmers was 71 per cent. (Desai, January 1978.) If commercial bank lending is added, the overdue rate was lower, about 40 per cent. It is also remarkable that in some well-administered programmes, the overdue rates of share-croppers, marginal farmers and small farmers have been found to be lower than those of others. In the West Bengal CADP[7] operation, for example, as much as 87 per cent of the total lending in 1974-75 was channelled to these weaker sections with a strong technical and delivery back-up, and their overdue rate was only 18.25 per cent as compared to 45 per cent for other categories of borrowers. (See CADP 1978.) High overdue rates should not, therefore, be regarded as an inherent peculiarity of every small-farm lending operation. If the operation itself is efficient in raising borrower income substantially with adequate technological and input supply support, there is no reason at all why the delinquency of small farmers should be larger than that of large farmers. In fact there is some basis for the presumption that large-farmer delinquency should be higher because they wield greater political influence. They manage to get repeated loans in spite of default because they can control or influence the lending institutions themselves. The small farmers on the other hand have every reason to repay their loans to be able to get new loans; they have no other leverage. Thus, the main answer to the repayment problem lies in maximising the income effect and increasing the structural efficiency of the credit operation itself. The other answers are wellknown: insurance of risks, flexible rescheduling when justified, recoveries through marketing institutions, and firm legal actions undertaken impartially against large as well as small borrowers when default is deliberate and unjustified.

I would like to conclude with a plea for the organisation of all identified beneficiaries of every district into a small farmer association. I find it very strange that the present constitution of the governing bodies of the SFD agencies provides for the membership of a few non-officials who may or may not truly represent the interests of small farmers. It is essential that the governing body be made answerable to the general body of all the beneficiaries of the district organised as an association. This association should also be a registered society. And the governing body should have adequate representation of (at least five members elected by) the general body of the small farmers' association. Such an association should act as the trade union of small farmers. It will ensure that the scheme is

vigorously and efficiently implemented, and benefits intended for small farmers do not leak to other classes. The association will also help identify all bonafide small farmers not yet registered in the district so far, and weed out wrongly identified beneficiaries.

This proposal emanates from a basic conviction that in the final analysis every class will get its due share of the national cake only if it politicises and unionises itself and demands what it deserves.

Notes

1 In this paper this term is used as inclusive of the Marginal Farmers and Agricultural Labours Scheme also. The two schemes were merged in the Fifth Plan period.

2 The term 'small farmers' includes 'marginal farmers' except where the two categories are specifically distinguished. The term 'large farmers' includes 'medium farmers'—in fact all farmers other than small farmers.

3 National Sample Survey.

4 The scheme was in effect in 160 districts in 1977-78.

5 The Drought-Prone Area Programme.

6 The Command Area Development Programme.

7 Comprehensive Area Development Programme.

Flying All Over

THE Soviet Union's ambitious plans of expanding its air links with other countries were unveiled at a recent press conference by the USSR Deputy Minister of Civil Aviation Sergei Pavlov, who said :

Three years ago the airlines of the countries associated with the Council of Mutual Economic Assistance launched an emulation campaign to improve service in the air and on the ground. The flights between the CMEA capitals have now become a model of service. This experience is being extended to other cities. A special long-term programme in the transport field is now being drawn up. Aeroflot, Balkan, CSA, LOT, MALEV, Interflung and other airlines will operate under general agreements they have co-ordinated among themselves and with different types of transport for the period ending 1990.

A new Aeroflot line, to Gdansk in Poland, was inaugurated on April 1. Air communications are being extended between the Soviet Union and Vietnam; the number of flights between Moscow and Hanoi has been increased to three a week and a new line, between Moscow and Ho Chi Minh City, will start functioning this summer.

Co-operation with Western airlines is constantly expanding and the number of flights and their frequency are increasing Aeroflot has been co-operating with the FRG for only seven years and a new line, between Kiev and Dusseldorf, was added on May 7 to the three already in operation — Moscow-Frankfurt (there will be daily flights starting this summer), Moscow-Munich and Leningrad-Hamburg

Regular flights on the Kiev-Paris-Kiev line, jointly operated by Aeroflot and Air France, were started on April 7. Before that Aeroflot operated jointly with Western companies two cargo lines — between Moscow and Paris and between Moscow and Amsterdam.

This summer Aeroflot planes will fly from Moscow to three new countries — Zaire, Kuwait and Jamaica. A new line will be inaugurated between Erevan and Aleppo in Syria. At public request more planes will be put into service on overloaded lines — to Addis Ababa, Athens, and Frankfurt-on-the-Main Economic, cultural and tourist ties are expanding so fast that more flights have to be added to the newly-inaugurated lines to Mexico City and Lima.

Aeroflot, this summer, will be operating 370 international flights a week, or 50 more than in the summer of 1978. The Soviet Union is now linked by air with 84 countries.

Nature of Class Struggle in Bangladesh

A Comment

Khondker Habibul Haque

B K JAHANGIR's 'Nature of Class Struggle in Bangladesh' (December 10, 1977) is an interesting contribution and merits a critical response. The present critique is not an overall review of Jahangir's article. It is only an attempt at closer examination, from a Marxist perspective of the salient points of his arguments.

The salient points may be summarised as follows :

(1) The creation of classes is linked with the introduction of capitalistic relations of production in Bangladesh.

(2) Class differentiation in Bangladesh is due not only to unequal access to the means of production but also to unequal access of political power.

(3) There is an alliance of the dominant classes of both rural and urban areas, such as the rich peasants, rural entrepreneurs, urban investors in agriculture, bureaucracy, and the dominant political party. This alliance not only leads to a continued exploitation but also helps to disorganise the poor peasants.

(4) The State contributes to the competition among the rich peasants. Class solidarity and struggles in the rural areas are often responses to the stimuli of government policies etc. Class solidarity and struggle depend on these factors (a) the state of the national economy, (b) the mediating role of the political parties and political elites, and (c) the characteristics of the specific local situations.

(5) The social basis of the Awami League was an alliance between the urban and the kulak interests. Sheikh Mujib's government strengthened the rich peasants and, in so doing, antagonised the urban interests.

(6) The new rulers are supporters of the urban interests, and have subordinated the agricultural (rural) power. Economically the rich peasants are still dominant, and are structurally aligned with the bureaucracy, etc.

(7) The poor peasants continue to be disorganised and the failure of the Left-wing parties has made them passive.

It is almost uncontestable that the class structure in Bangladesh is rooted in the capitalistic production relations. But it is exceedingly important to qualify this statement, tracing the gradual incorporation of Bangladesh society in the orbit of world capitalist economy or the world system (Wallerestein, 1974), from the colonial period of the eighteenth century onwards. This might spark off another, but related debate on the mode of production in Bangladesh. One might tend to see the dominance of the feudal mode of production or other precapitalist formations (or modes) in the rural society of Bangladesh. On an *ad hoc* basis we might sum up this debate saying that pre-capitalist modes of production may exist in Bangladesh but that these are articulated within the capitalist mode which is dominant. This provisional solution of a rather tricky question is made in the light of the Frank-Laclau debate (1973).

Jahangir rightly takes into account the political dimension as a basis of class differentiation in Bangladesh. Taking into account the political factor in class differentiation is very pertinent—especially in the context of the peripheral, or the so-called third world, societies. Poulantzas (1973), among others, has stressed this in greater detail in order to counter the positions of economistic Marxism. His analysis, though, concerned with the 'advanced' Western societies sheds light on other societies too. Economy, as a basis of class, is determinant but not sufficient. Political and ideological forces also play a significant role in the formation of classes.

The alliance of the dominant classes, such as, rich peasants, rural entrepreneurs, urban investors in agriculture, bureaucracy, etc, poses a theoretical problem. The basis of this alliance is not elaborated. What is implied is that they, together, constitute the dominant exploitative classes with the exploitation of the poor peasants as the focal point of their unity.

First, this alliance does not account for the contribution of the State institutions (presumably, bureaucracy) of throwing the rich peasants into competition. When the rich peasants in their alliance with the bureaucracy and the dominant political party become the basis of State power there is no apparent reason for the bureaucracy to create competition among the rich peasants. These arguments not only lack theoretical support but also lack logical content and become merely assertions. The bureaucracy may, however, be linked with factional competition among the rich peasants on political grounds—allocating resources to one peasant rather than to another—but this is not even implied in Jahangir's arguments. The State's contribution to the factional competition among the rich peasants can be attributed also to the contradictions of the post-colonial State apparatuses.

Secondly, the alliance of the dominant, exploitative, classes does not at least theoretically preclude the class unity of the exploitative classes with the notable exception of the 'Labour Aristocracy' as exemplified by Lenin. The 'polarisation thesis', which fell apart in the context of the Western industrialised countries, is much more of a reality in the rural situation of the peripheral societies. Jahangir appreciates this polarisation, but he does not see the promises this polarisation brings—i e, revolutionary upsurge. The present disunity of the polarised, exploited, classes may be attributed to the lack of communication (both in the physical, i e, role transformation as well as in the interactional sense). Marx-Engels stressed this point in the "Communist Manifesto". Insofar as the peasants are concerned, this problem seems to be rather perennial.

In discussing the nature of the class struggle, Jahangir at one point argues: "Different classes in the rural area will evaluate the programmes of development from their own perspectives, assessing whether the programme will strengthen their power, and enlarge their social base, etc.... These conflicting *outlooks* (emphasis added) affect class solidarity and the nature of the class struggle" (P 2064). This seems to be a rather weak argument. How could 'outlook' affect struggle? If he is implying class consciousness, in making reference to outlook, it becomes a different issue. Interestingly enough, the term 'class consciousness' seems to be absent from the content of his article. In the tradition of Althusser, many neo-Marxist writers have underplayed the concept of class consciousness and also argued that the notion of 'class in itself' (class without class consciousness) and 'class for itself' (class imbibed with class consciousness and ready to wage struggle) are Lukacsian rather than Marxian notions. The polemic against the division of an inactive 'class in itself' and an active 'class for itself' has also been provided by Poulantzas (1973) who interprets the Marxian notion, saying that classes have existence only in the class struggle. Jahangir's views do not fit in any of these contending interpretations, nor

does he advance a new interpretation.

The mediating role of the political party and political elites in the class *struggle poses another serious theoretical* problem. Jahangir quotes other writers showing a correspondence between economic and political power in the orthodox Marxian sense. "As a social class, it is the rich peasants who control the means of production. They are the main decision-makers in the rural areas (Rashiduzzaman, 68, Jahan, 72). They also control the sources of economic and political power." (Jahangir, 77; p 2063). But again, when he talks about the mediating role of the political party or bureaucracy, he swings to a different position. There is a position in contemporary Marxism that the State—taken in its broadest sense to comprise political party as well as bureaucracy—mediates the conflicting interests of the bourgeoisie and the working class, dissipating the decisive struggle. Here, I allude to the Miliband-Poulantzas debate on the relationship between State and the economically dominant classes, which seems to have recently ended (1976). By making reference to the mediating role of the political parties and political elites, Jahangir touches on a problematic but only gives it casual treatment. The relationship between the State and the dominant economic classes, in the *peripheral societies, is to be explored in* greater detail.

In discussing the class basis of the Awami League, Jahangir has used vague terminology such as, 'urban interests', etc. He does not explain what he means by the alliance of 'urban and kulak interest'. Kulak may be a self-explanatory concept, but what does he mean by 'urban interest' which is rather recurrent in his article? Surely, he does not want us to believe that the urban population is a homogenous group (or class) in Bangladesh He does not refer, nor does he seem to agree, to the petty-bourgeois background of the Awami League (Abdullah, 1972, Khondker, 1978). He also ignores the struggle between the rising bourgeoisie and the ruling petty-bourgeoisie, which culminated in a series of military coups and the establishment of a new rule in 1975 in Bangladesh (Lindquist, 1977) Jahangir remains rather vague in analysing the class character of the new rulers in Bangladesh and says, "The new rulers are basically supporters of urban interests" (p 2065).

Jahangir remains silent on the inflow of foreign capital, in terms of aid, etc, in Bangladesh. Positing Bangladesh in the world capitalist system and examining the role of the State apparatus, in Alavi's words 'the military-bureaucratic oligarchy', (1972) and their position in the class struggle in Bangladesh are *long overdue. A study into the nature* of the class struggle would remain incomplete unless these factors are taken into account.

Corporation Bank

CORPORATION BANK, one of the leading scheduled commercial banks in the private sector, has proposed an equity dividend of 15 per cent for the financial year 1978 on the increased capital of 62.50 lakhs and 9 per cent and 8½ per cent on the two classes of preference shares, subject to deduction of income-tax. The year's operations resulted in a profit of Rs 22.38 lakhs as against Rs 19.68 lakhs in 1977. After transferring Rs 13.21 lakhs to reserves, the Directors have proposed the above dividends. The equity rights shares issued during 1978, will be eligible for proportionate dividend for three months from October 1, 1978. The Directors have also proposed to issue during 1979 Rights Equity Shares to the extent of Rs 25 lakhs in the ratio of one share for every three equity or preference shares held. This is the fourth Rights Issue the Bank is making since 1974 and, with this, the paid-up capital will reach Rs 1 crore. The Bank has recorded significant growth in both deposits and advances. As at the end of 1978, aggregate deposits stood at Rs 208 crores and advances at Rs 118 crores, recording an increase of 43 4 per cent and 54.3 per cent respectively over the previous year. The total outstanding credit to priority sector including food credit as at the year end constituted 35 9 per cent of the total advances. The percentage increase in export advances was from 8 3 per cent in 1977 to 21.7 per cent in 1978 The Bank opened 18 Branches during 1978, taking the total number of branches to 293 as at the year-end.

and BORIC ACID

in glass

Gleaming. Transparent. Lucid. Plain or colourful. Borax plays its vital part in the making of high quality glass, fine ceramics and vitreous enamels.

Borax and Boric Acid share the shine of the glass industry with a polished performance. A performance consistent in research and development through the years to help make better glass.

But that's only half the story. Internationally-known '20 mule team' Borax and Boric Acid are serving varied applications in industries as diverse as leather and wire drawing, timber and drugs, and cosmetics. And of course, in agriculture. No wonder, Borax has become a symbol of quality and reliability guaranteed through years of research and development.

Whistling in the Dark

WITH its attention too much engaged elsewhere, authoritative pronouncements on behalf of the government on the state of the economy have been few and far between. One such came recently from the Secretary to the Department of Economic Affairs when, deputising for the Finance Minister who had been suddenly taken ill, he talked to members of the Forum of Financial Writers in Delhi. Among his major propositions were that (i) the current rise in prices was partly seasonal and partly a matter of deliberate government policy to help industries subject to price control; (ii) there had been a revival of investment in the economy; and (iii) the rate of growth of employment in the organised sector had gone up.

On inflation, the 7.5 per cent rise in the wholesale price index since the end of February was attributed to "reversal of the earlier policies" and the application of necessary correctives to the administered prices of certain commodities In this regard, the examples of sugar, cement and steel were cited. In the government's view, the prices of these commodities had been unduly depressed and it was necessary to make a correction. In addition, there were also seasonal factors responsible for the pressure on commodity prices.

A closer look will show this to be a superficial appreciation of the price situation. First, it is true that administered prices of cement and steel have been raised and as a result there has been a rise in their wholesale price indices Their total weight in the official index of wholesale prices is, however, no more than 6 2 per cent. On the subject of sugar prices, the Secretary to the Department of Economic Affairs sought to argue that "nearly 35 per cent of the recent increase in the index was accounted for by sugar, gur and khandsari" which, according to him, was justified because "sugar prices had dipped to a point where the mills were not getting even their cost of production" Now, the wholesale price index for sugar (base : 1970-71 = 100) was 158 6 at the end of March 1978 and it came down to 150.7 about a month and half later, on May 13, 1978, but during the same period the gur price index came down from 150 to 133.7. The separate indices for sugar and gur are not available for the corresponding point of the current year (i e, May 12, 1979) but the index for the sub-group sugar, khandsari and gur as on May 12, 1979 had gone up to 175.4 as against 139.4 a year ago on May 13, 1978, showing a rise of 25.8 per cent over the year. The rise, it is certain, had taken place in the price of sugar and not in that of gur, though it is the latter that had earlier shown a sharp fall. More important, what explanations can possibly be offered for the large increases, ranging from 7 per cent to 20 per cent, in the prices of a wide range of manufactured goods? In their case, neither the argument of seasonality nor that of correcting earlier imbalances can hold water.

Government's view of current investment trends, it appears, is equally over-optimistic Here the evidence cited in support of the official claim is that of the disbursements of term-financing institutions, which have gone up from Rs 435 crores in 1975-76 to Rs 891 crores in 1978-79. Disbursements of term-lending institutions are, however, an unreliable indicator of investment in the private corporate sector. Official statistics themselves bear this out. Thus disbursements of all term-lending institutions went up from Rs 435 crores in 1975-76 to Rs 591 crores in 1976-77 and further to Rs 694 crores the following year, but the CSO's estimate of gross fixed capital formation by the private corporate sector (including the co-operative sector) declined from Rs 2,002 crores in 1975-76 to Rs 1,405 crores in 1976-77 and rose but slightly to Rs 1,525 crores the following year. Thus though disbursements increased by about Rs 250 crores between 1975-76 and 1977-78, gross fixed capital formation declined by a little less than Rs 500 crores

Besides disbursements of term-financing institutions increasingly substituting for other sources of investible funds, another aspect of the pattern of project financing which has emerged in recent years is significant This is the tendency for progressively larger proportions of project costs to be appropriated for purposes other than physical asset formation (i e, other than investment in land and buildings and plant and machinery) According to the data put out by the Department of Company Affairs, 73 6 per cent of the project costs of companies issuing capital in 1975-76 was deployed for (i) land and buildings, (ii) plant and machinery and (iii) miscellaneous fixed assets. However, by 1977-78 this proportion had gone down to 58 4 per cent In other words, in 1977-78, as much as 41 6 per cent of the total project costs were eaten up by such items as (i) working capital, (ii) technical knowhow,

(iii) issue, pre-incorporation, etc, expenses, and (iv) contingencies. The corresponding proportion in 1975-76 had been only 26.3 per cent.

The argument that the emerging shortages of items like steel and cement indicate growth of genuine investment demand also needs to be viewed with some caution. Output of both cement and steel increased only marginally in 1978-79. No doubt there have been some imports Nevertheless it would be useful to examine what proportion of the demand for steel and cement is of a speculative nature, creating artificial scarcities as happened in 1973-75. Further, prices of investment goods have gone up very sharply during the past year. Between May 13, 1978 and May 12, 1979, the wholesale price index for 'machinery and transport equipment' rose by 11.3 per cent, for 'iron and steel and ferro alloys' by 31.5 per cent, and for 'cement, lime and plaster' by 22.6 per cent. So even if investment outlays do show a rise in financial terms, a significant part of the rise would have been accounted for by increased investment cost. The investment demand for such goods as cement and steel cannot, therefore, be as high as the apparent scarcities suggest. If black market premiums have emerged, they do not necessarily indicate higher investment demand; *they could as well as be signs of speculative demand.*

This brings us to the third point—the alleged larger absorption of labour in the organised sector. The increase in employment in organised industries may indeed have been 3.4 per cent in 1977-78, compared with a rise of 2.7 per cent in 1976-77—a small enough improvement. Official data themselves, however, suggest that the employment situation in the organised industrial sector did not undergo any marked change in 1978-79. According to Employment Exchange statistics, for instance, the average number of applicants placed in employment remained unchanged at about 38,000 in 1977 and 1978; it had been slightly higher at around 41,000 in 1976. And the number of applicants on the live registers of employment exchanges went up from 109.24 lakhs in December 1977 to 126.75 lakhs in December 1978, i e, by 17.54 lakhs, compared to a rise of 11.52 lakhs in the previous year.

Export Subsidy

Dubious Basis

FOR the last few years, one item in the Central government's accounts which has unfailingly attracted the unfavourable attention of the Comptroller and Auditor General of India is the payment of cash assistance to exporters. The Comptroller and Auditor General's report for 1976-77 has singled out for criticism the disbursement of cash assistance on export of transmission line towers (TLT). There never was, it transpires, any quantifiable basis for the levels of cash assistance fixed from time to time or for the revival of the scheme after it had been decided to discontinue it. The Comptroller and Auditor General's comments on the subject are also the theme of the 129th report of the Public Accounts Committee (Sixth Lok Sabha) presented to Parliament recently.

The rate of cash assistance on export of TLT was 20 per cent of f o b realisation from June 6, 1966 to March 31, 1970. Additional assistance of 5 per cent was granted from March 1, 1968 *if* an exporter raised *his* exports beyond a specified level and from April 1, 1969 a further 5 per cent was granted for exports to North and South America and New Zealand. With effect from April 1, 1970 the rate of cash assistance was raised from 20 per cent to 25 per cent with an additional 5 per cent on exports to North and South America and New Zealand. From April 1, 1973 cash assistance was granted on a sliding scale ranging from 10 to 25 per cent, depending upon the percentage of production exported. Cash assistance on export of TLT was abolished with effect from February 23, 1974, but was reintroduced at the rate of 10 per cent with effect from October 1, 1975.

The Ministry of Commerce admitted to the Auditor and Comptroller General that no study of cost of production and f o b realisation had been carried out before it was decided to reintroduce cash assistance on export of TLT. Instead the Ministry claimed that cash assistance had been reintroduced "as a promotional measure taking into account the various factors, such as export prospects, production capability in the country, the competitive strength of our products *vis-a-vis* the international prices and other relevant factors". The Ministry further explained that the decision to restore export assistance had been taken "in the face of acute foreign exchange shortage obtaining in the country" and pleaded that "a detailed examination of financial aspects, namely, marginal costing and trend in f o b realisation of a large number of engineering products would have taken a long time and defeated the very purpose for which the reintroduction [of cash assistance] was resorted to".

The long and short of it is quite simply that there was no quantifiable basis for the fixing the level of cash assistance or for deciding to revive it after having discontinued it. And in the absence of such a basis, it is impossible to objectively assess the reasonableness of the level of assistance granted to any particular export. In effect, the very large amount of cash assistance for export paid out by the government every year—it was Rs 381 crores last year—is the cumulative result of a series of such *ad hoc* decisions based on, in the words of the Public Accounts Committee, "extraneous factors and dubious considerations". Not only that, in the case of TLT, the decision to revive cash assistance had been based on downright false information fed to the Commerce Ministry by exporters.

The Ministry claimed that TLT had been identified as a commodity for which reintroduction of cash compensatory support was "eminently called for" on the ground that during the period (October 1974 to September 1975) following the withdrawal of cash support in February 1974 there had been a decline in exports According to the Ministry's figures, exports had dropped from Rs 135 lakhs during April-September 1974 to Rs 112 lakhs during October 1974-March 1975 The Comptroller and Auditor General, however, pointed out that according to statistics published by the DGCIS, exports of TLT had actually gone up during the same period (from 3,952 tonnes during April-September 1974 to 4,264 tonnes during October 1974-March 1975). In value terms, exports rose from Rs 1 27 crores in 1973-74 to Rs 2.47 crores in 1974-75. Confronted with the discrepancy between its own figures and those of the DGCIS, the Ministry of Commerce was content merely to admit that "it has not been possible for us to reconcile the figures obtained from individual exporters and those published by DGCIS". That in the first instance, before making a major policy change on their strength, it ought to have cross-checked the figures supplied by exporters did not evidently occur to it

The Comptroller and Auditor General also carried out certain exercises to compare the f o b realisation of TLT exporters with the cost of production. The net Joint Plant Committee (JPC) prices (excluding excise duty, since duty drawback was admissible) at which steel, which constitutes the bulk of the raw material requirement for TLT, was being supplied to exporters from April 1973 onwards were consistently far below the international prices of steel, giving Indian manufacturers of TLT a price advantage varying from Rs 267 to Rs 1,078 per tonne of TLT. Further, the average f o b unit value per tonne realised on exports was consistently rising and the rise was maintained also during the period following the withdrawal of cash assistance. A test check by the Comptroller and Auditor General of the production returns of the

major manufacturer-exporter of TLT showed that the average ex-factory value less duty drawback had left, with reference to the average f o b unit value realisation of Rs 4,020 per tonne, a sufficient profit margin. And yet cash assistance was revived in October 1975 and has been *continuously extended since then and still* remains in force. The Public Accounts Committee concludes, "The foregoing facts amply prove that the cash compensatory support for export of TLT was reintroduced w e f October 1975 without adequate examination of its justification and that *in taking the decision the government relied* largely on the case built up and the data supplied by the manufacturer-exporters without bothering to cross-check them from other data collecting agencies inside or outside government. Once it was introduced in October 1975, the decisions for its continuance from time to time were also taken on *ad hoc* basis without at any stage going into the justification for its continuance".

How the boondoggle of export is used to extract concessions for which there is no justification at all is further illustrated by the government's decision to extend all export incentives, including cash compensatory assistance, to supplies made by Indian firms to IDA-aided projects in India "provided the orders were won by them in the context of global tenders". The benefit of this was naturally extended to Indian manufacturers of TLT to ensure that they "were not ploughed under by competition from better organised manufacturers abroad". While the principle of it may be unexceptionable, what the government had not done was to check whether Indian manufacturers of TLT were actually facing any competition from foreign manufacturers. In the event, a check by the Comptroller and Auditor General showed that although global tenders has been invited in all cases of TLT supplies for IDA-aided projects, and these supplies had qualified for all forms of export assistance, in no case had a single bid been received from any foreign supplier.

Clearly, cash assistance for export of transmission line towers has no justification in terms either of improving the competitiveness of the Indian manufacturer or of making up for the relative lack of profitability of the export market. How representative the case of TLT is of the entire range of exports which qualify for generous export assistance, is, of course, impossible to say. But what is true, it is evident from the Ministry of Commerce's responses to the Comptroller and Auditor General as well as the Public Accounts Committee, is that as in the case of TLT, the decision to grant export assistance as well as the rates of such assistance are not as a rule based on dependable calculations of cost of production and export realisation. What then are they based on?

L N Mishra Case

Police at Work

FOLLOWING some recent fresh revelations about the background and circumstances of the murder of Lalit Narain Mishra in January 1975, questions are again being asked whether the whole affair was not part of a much larger conspiracy involving some of the closest political colleagues of the murdered minister. The reports in *Indian Express*, based on a detailed study of the available documents undertaken at the instance of Karpoori Thakur in January this year, when he was chief minister of Bihar, make a strong case for a fresh investigation. Whether or not there is ground to believe that very powerful colleagues of Lalit Narain Mishra were involved in his murder has of course to be established by a fresh inquiry, hopefully less infirm than the previous one which singularly failed to give any finding in respect of the facts and circumstances pertaining to the explosion that occurred on January 2, 1975 at Samastipur. And it is for the courts to say whether indeed the murder was part of a conspiracy, that is, in the event the state withdraws its present brief and presents a new chargesheet.

But one thing is certain, though, and indeed gets overwhelming support in the findings of the unofficial investigation into the circumstances and facts of the murder of Mishra. The Indian police are quite sophisticated: the organisation is not in the least slack, and generally has a fair idea of what is what in any crime: it is known to conceal and destroy evidence and indeed fabricate a wholly new set of facts to suit the convenience of its masters; it is quite an expert in the art of creating scapegoats and fall guys; and so on.

It is true that the police, given the nature of their jobs, have to have constant links with the 'underworld'. The daily routine of police investigation involves constant interplay of the forces of law and order and the criminals, and without the stool pigeon and the informer, police would not even be able to begin investigation into a case. But what is notable about the revelation of the Mishra murder case is the use of these contacts, not so much to break a case, but to cloud one which had all the appearance of having been solved; lines of inquiry which were glaringly illuminated were abandoned in a most incomprehensible manner, and a whole set of new suspects were found—and in once cases actually given a wholly new identity—tutored and tortured, offered threats and blandishments, all with a view to making them confess that they, in the company of some known Anand Margis, had taken part in the attacks on Lalit Narain Mishra and, later, in the attack on the car of the Chief Justice of India. Here again, what is relevant is not whether the 'reconstruction' attempted in the *Indian Express* reports are correct in all details, or even whether they are broadly correct; what is more material is that the practices of the police, especially the methodology of the fabrication of a case unto its last and most minute detail, involving long sessions with a potential suspect who is induced, cajoled, or coerced to confess to a variety of very serious crimes, is not in the least a novel revelation. Indeed, as regularly as a suspect confesses before a magistrate, equally regularly he retracts the confession before a superior magistrate when once he is freed of the dread of police custody and secured of the relatively less dreaded judicial custody, though of course it is a moot point whether even such retractions are not part of some labyrinthine play involving both the police and criminals.

Such deals and counterdeals involving petty crimes might be entirely determined by the appreciation of a given situation at the local level by the thana officer; but they acquire a completely different dimension when the case involves the murder of a senior and controversial political leader. Whatever unorthodox methods of investigation the police might have adopted in the Mishra murder case should have followed specific (though naturally verbal) orders from very highly placed police officers who themselves also could not have taken any initiative one way or the other without similar direction from their political masters.

Another feature of the revelations about the Mishra murder case is the extraordinary *esprit de corps* and sense of unbroken permanency that marks the higher levels of our various bureaucracies. The myth of the neutral service is of course one of those serviceable myths that are encouraged by the rulers; but leave alone its avowed 'class neutrality', powerful sections of the Indian bureaucracy are apparently incapable of being neutral even between contending political groups. For nothing else can explain the extraordinary obstructions and false trails and red herrings laid in the way of attempts by the new administration to investigate afresh the mysterious circumstances of the murder of Lalit Narain Mishra.

Because of a strike at the States' People Press, the size of the issues has to be restricted till normal printing arrangements are restored.

Gold

Another Round of Laundering?

IN May 1978, the government commenced auctioning gold from out of its non-monetary stocks, estimated at 86 tonnes at the end of 1977, ostensibly to keep the domestic price of gold under control. It took only 14 auctions spread over six months for the government to shift ground and claim that the objective of the auctions was not to hold down the price of gold or stabilise it but to garner revenue. Since the domestic price of gold continued to zoom despite auctioned supplies amounting to about thirteen tonnes, the government was finally forced to suspend the auctions. The fact that this volume of gold, valued around Rs 90 crores, helped to bleach number two (black) money of about a half to a third of the estimate of number one money value of the auctioned gold was of course glossed over. (Between the first and the fourteenth auction, the domestic price had risen from Rs 695 to Rs 850 per ten grammes! In a virtually free market, it could be claimed that purchases made at the time of an earlier auction were sold later; and, naturally, bleaching involved payment of number two in excess of the ruling price in number one money.)

Those were the days when there was little hesitation in conceding that generation of number two money was necessary for growth, so much so that the belief got round that tax administrators had been told to pull their punches. At any rate, little attention was paid in October 1978 to the fact that the government had not abandoned gold auctions but only suspended them. It was assumed at that time that the government only wanted to save face by resorting to 'suspension' of auctions and by a appointing review committee on the subject, including import of gold for sale in the domestic market. Now it seems that that assumption was simplistic. Options had been retained for exercise at the opportune time. The opportune time is apparently now.

The international price of gold is rising rapidly. The prevailing price is in the $ 255-60 range (against $ 175-180 a year ago) and the reckoning of the price trend is extremely bullish ($ 270 in a matter of weeks) in view of expectations of rapid inflation stemming from the hike in oil prices. Restoration of auctions would be therefore propitious for bleaching. (Incidentally, since the abandonment of gold auctions the domestic price of gold has risen by about 15 per cent; the international price rose during the period by 10 per cent.)

Clearly, pressures have been built up—what the review committee, of which the Reserve Bank Governor is chairman, has recommended is not known—to such an extent as to have provoked the Planning Commission into coming out against resumption of auctions and import of gold. The latter is being advocated not only by the Zaveri Bazar lobby but by certain economists as a revenue measure. Bleaching apart, if the international price of gold continues to scale new peaks, after payment of import duty (to garner revenue) the domestic price of gold would be truly formidable. The assumption of gold sales at an exorbitant price of course is that our incomes policy would continue to support burgeoning incomes of a highly select section of society so as to enable these income earners to contribute to growth and welfare through revenue contribution *via* gold purchases.

Banks

Dissecting Priority Sector Credit

WITH much fanfare the Reserve Bank had launched in 1972 the system of Basic Statistical Returns (BSR) with the objective of "systematic reporting of banking data to ensure the availability of fairly comprehensive information with a minimum of time-lag". Through the BSR it was sought to collect data on advances (BSR 1), deposits (BSR 2), advances against sensitive commodities (BSR 3), ownership of deposits (BSR 4), and investments in government, semi-government and corporate securities (BSR 5). Unfortunately, the Reserve Bank has been extremely tardy in processing the data and publishing them. As of mid-1979, the latest volume presenting comprehensive data as per the BSR pertains to December 1975, while summary results have been published for December 1976. One of the important objectives of the BSR system was to provide the necessary feedback to commercial banks so that they would refine their own methods of credit planning and performance budgeting. But as banks have not been getting this feedback from the Reserve Bank, they seem to be losing interest in the whole exercise and are themselves becoming slow in submitting the required statistical returns.

There are exceptions, however. Some banks have even taken the initiative to process their own BSR data and to publish them. The Syndicate Bank, for instance, has published its Basic Statistical Tables for December 1977. This is the second volume of Basic Statistical Tables published by the bank and presents the age-wise distribution of the bank's branches, different types of deposits and advances, separately for different population groups such as rural, semi-urban, urban and metropolitan/port towns. It also presents data on bank credit, classified by different sectors (or what the bank calls 'occupations') and by population groups, which makes it possible to know what proportion of, say, the bank's agricultural advances come from its rural or semi-urban branches. Also significant are the data on the distribution of the bank's priority sector advances by (a) population groups, (b) size of credit limit, (c) interest rate ranges and (d) type of credit accounts.

The Syndicate Bank has reason to be happy with its performance since nationalisation. In 1969 the bank ranked eighth among the 14 nationalised banks in terms of credit and ninth in terms of deposits; in 1977 (and in 1978) it had improved its rank to sixth in terms of both deposits and credit. Its share of deposits of all scheduled commercial banks rose from 1.63 per cent in December 1969 to 3.98 per cent in December 1977 and of credit from 2.85 per cent to 3.92 per cent. The bank's performance was noteworthy also in respect

of advances to the 'priority sectors'. In 1969, with 31 per cent of credit for priority sectors, it ranked third; by December 1977 this proportion had reached 40 per cent and the bank ranked first.

A disaggregated view of the Syndicate Bank's advances to the priority sectors brings out a number of noteworthy features. First, only 17.5 per cent (or Rs 48 crores out of Rs 262 crores) of the total credit for priority sectors in December 1977 was granted from the bank's rural branches; another 23.2 per cent (Rs 61 crores) had come from semi-urban branches. The balance of approximately 60 per cent of priority sector advances had been made by urban and metropolitan branches. Even taking only direct agricultural advances of Rs 46.3 crores outstanding as at end-December, 1977, rural branches accounted for only Rs 19.6 crores (i e, 42 per cent). To look at it differently, of the total advances of Rs 63.3 crores in respect of the bank's rural branches, agricultural advances accounted for only Rs 22.7 crores or 36 per cent. These data thus suggest that a good portion of agricultural advances are really granted in respect of farm operations undertaken near semi-urban and urban centres. These advances are unlikely to be for marginal and small farmers who are not likely to be able to approach urban or, even semi-urban branches.

This is corroborated by the data on the distribution of priority sector advances by size of credit limit. Out of total outstanding credit of Rs 262 crores to the priority sectors, only 22 per cent was in respect of credit limits of Rs 10,000 and below. At the other extreme, about 23 per cent of outstanding priority sector credit was in favour of those with credit limits of Rs 10 lakhs and above. Thus about Rs 59.75 crores out of a total of Rs 262 crores of priority sector credit was accounted for by credit limits of Rs 10 lakhs and above. Among them, 15 parties had credit limits in the range of Rs 1 crore to Rs 2 crores, three parties in the range of Rs 2 crores to Rs 5 crores and another two parties Rs 5 crores and above. And yet all these are considered part of priority sector advances. Credit limits in the middle ranges of Rs 1 lakh to Rs 10 lakhs accounted for Rs 67 crores or over one-fourth of total priority sector advances. In other words, if Rs 1 lakh is considered the outer limit for designation as 'priority sector', nearly 50 per cent of existing priority sector advances would get excluded.

The data on distribution of the Syndicate Bank's priority sector advances by interest rate ranges show that in December 1977, when the minimum lending rate was at 16.5 per cent except for priority sectors with limits upto Rs 2 lakhs, only 32.8 per cent of priority sector advances was at rates upto 13 per cent. It is, of course, possible that it was the bigger parties in the priority sectors who were charged higher rates of interest. On the other hand, field surveys have shown that except in respect of DIR advances, commercial banks have in fact been charging almost the same rates for priority sector advances as for other advances. In addition, as a recent NCAER study has brought out, banks make a series of other charges such as stamp duties, registration charges, and documentation expenses which work out to roughly 2 to 3 per cent of the amount of the loan.

Southern Africa

'New Reality?'

ON May 23, the US Secretary of State, Cyrus Vance, and his counterpart in the new British government, Lord Carrington, told a joint news conference in London that "There is a new reality [in Rhodesia] and we must recognise that there is a new reality". This urge to recognise the 'new reality' followed the Rhodesian 'elections', which were described by an independent member of the British House of Lords who was deputed to observe them as a "gigantic confidence trick designed to foist on a cowed and indoctrinated black electorate a settlement and a constitution which were formulated without its consent and which are being implemented without its approval".

It is not as if the infirmities of that election or even the fact that these infirmities were deliberately built into the every aspect of the elections—the non-existent electoral rolls; the progressively diminishing official assessment of the number of eligible voters which in the course of less than a year came down from 4.8 million to 2.8 million; the novel constitutional provisions according to which a group of people forming less than four per cent of the population would have 28 seats out of a total of 100 reserved for them; the other 'entrenched provisions' which guarantee special privileges to this section of the population including complete dominance in the sphere of the administration of judiciary, the executive, army and the police—have not been widely recognised. Indeed, Abel Muzorewa's own partner in the transitional government, Ndabaningi Sithole, described the polls as having been riddled with "gross irregularities", and has refused to join the new government.

That the policy of the United States and Britain towards the rebel regime in Rhodesia was due for some serious reconsideration has never been in doubt. Indeed, the whole thrust of Anglo-American diplomacy since the Carter administration took over have been towards effecting such a transfer of power in Rhodesia as would ensure continued white dominance in one form or another in that country and, more importantly, also ensure that the territory would serve as a stable and dependable buffer between independent African countries and South Africa, materially and strategically a most important country. British policy on this question has of course been thoroughly bipartisan, as correctly maintained by James Callaghan the day before he was voted out of office, and one of the last acts of the Labour government was to instruct the British delegation to abstain on a Security Council resolution on May 1 which declared that the 'elections' in Rhodesia "held under the auspices of the illegal racist regime and the results thereof as null and void".

Anglo-American policy on Rhodesia too has been marked by a fine identity of views, whatever be the complexion of the administrations in the two countries at any given time. It was surely not accidental that the very day when the new British Prime Minister was telling the House of Commons that her government "welcomed the major change that has taken place in Rhodesia as a result of elections and the emergence of an African majority government", the US Senate was also voting overwhelmingly in favour of a resolution calling upon the US President to lift the economic sanctions within ten days of the installation of the new government in Salisbury. The British government, still taking its constitutional responsibilities for Rhodesia seriously, has also despatched a senior official at the Foreign and Commonwealth Office to Salisbury where he is to have "preliminary and exploratory" talks with Muzorewa, no doubt taking into account the existence of the 'new reality'.

It is, however, not certain that the impending lifting of the sanctions, or even the possible recognition of the regime by some Western countries following the lead given by Britain and the US, can affect the actual situation on the ground in Rhodesia itself. With about 85 per cent of the area of the country under Martial Law (that is, under guerilla control), with the government's 'overkill ratio' getting less and less satisfactory and, more significantly, with more and more whites leaving Rhodesia than entering it—more than 9,000 whites are reported to have left Rhodesia in the past six months—the situation has long been past when one could still think of sanctions (which, in any case, never really worked and were perhaps not even intended to work, if one were to go by the revelations of the Bingham Report) as a weapon against the rebel regime.

Jute Workers' Empty 'Victory'

TIMIR BASU's remarks on the recent 50-day jute workers' strike struggle (March 24-31) are a travesty of the facts, history and experience of the jute workers' repeated general strike struggles. This 50-day old general strike is the fifth one within a decade. A firm and factual rebuttal has, therefore, become necessary.

Timir Basu writes that "all other central unions expressed their unhappiness over the 'agreed' points, as well as the manner of conducting the conciliation proceedings". Is this correct? No, it is not.

Apart from CITU and AITUC, Basu chooses to dismiss UTUC, TUCC and HMS as mere CITU allies. Then what about the INTUC union, RCMU, which is happy about the outcome of the strike struggle? Basu does not deign to notice it at all, obviously because that would explode his entire anti-CITU approach.

To proceed, what is the character of these "all other central unions"? In 1974, barring UTUC (Lenin Sarani) and BMS which did not exist at that time, Basu's "all other central unions" signed a treacherous agreement at midnight, before the general strike scheduled to start next day, at the behest of IJMA and Gopaldas Nag, the then state Congress Labour Minister. The 33-day general strike started on the scheduled date against this black agreement and continued against heavy repression and strike-breaking activities of these "all other central unions". As a result "these other central unions" almost wholly lost whatever little credibility they had with the jute workers.

To proceed further. Basu opines, "the most unsatisfactory aspect of the agreement is the complete negation of the Raghunath Reddy Award on badli workers". I could appreciate his concern for the Raghunath Reddy Award, if he did not gloss over the fact that the issue of badli relief was raised by CITU, supported by all other unions, in the 1970 general strike which was prolonged by a week in order to get it incorporated in 1970 strike agreement; that in the 1974 black agreement the 'other central unions' dropped the issue of badli relief, i e, repudiated the 1970 agreement in favour of the employers; that the 1974 general strike was conducted by CITU, AITUC and others against this gross betrayal; and that as a result of this determined strike struggle in 1974, the Raghunath Reddy Award followed even though IJMA informed Raghunath Reddy that the "other central unions" had already dropped the issue in a signed agreement. Why does Basu hide all these well known facts? And with what purpose?

Again to proceed. How do matters stand in respect of the 1979 strike on this issue? IJMA threw the 1974 black agreement (though repudiated by the workers) by the "other central unions" repeatedly in our face when CITU, AITUC and others stubbornly insisted upon the implementation of the Reddy Award. It is also an established fact that the present strike was prolonged particularly because CITU, AITUC and others resolutely stood firm that the question of badli relief and gratuity must be settled before the strike could be called off. The Raghunath Reddy Award could not be clinched because IJMA made it a breaking point. And it was not possible to prolong the strike for another 30 days or more. It is a gift of "all other central unions" whom Basu lauds to the skies, that the issue of badli relief could not be clinched even in this strike. But the issue is not dead as Basu implies, but very much a live one, CITU and others have not agreed to drop the issue, as done by the "other central unions" in this strike also. The struggle will continue. And IJMA knows that.

Now to the other points.

(1) As regards retrospective effect of the agreement. Unions insisted that it should have retrospective effect from the date of submission of the charter of demands. Hence the issue did not go by default, as alleged by Basu. Further, the CITU would have tried to continue the strike after 50 days, if there was any tangible prospect of clinching the issue.

I wonder how Basu could conclude that CITU was in no mood to go on strike after the 40th Annual Conference? Actually CITU wanted to go on strike in November 1978. But it had to be postponed due to the devastating floods. CITU, of course, did not want to go on strike in 1977 or in the early part of 1978, because the time for a general strike should be carefully chosen, i e, workers should go on strike when the employers are literally afraid of strike and not when employers invite a strike as they did in 1975 and there was the 48-day fruitless general strike. CITU at that time had pleaded for a postponement of strike, because the employers welcomed a strike in the face of a sagging market, but others did not heed its advice. But CITU joined the strike and fought most doggedly. CITU did not want to repeat that Himalayan blunder this time. The time of the 1979 strike was well chosen and under booming market conditions IJMA had to give in.

(2) Evidently, Basu does not know the simple fact that even if the Left Front government revokes the Ray Ministry's orders under DIR on the Bhattacharya Commission's recommendation on DA, it has no legal powers to enforce the same and knowing this the employers flatly rejected the demand for its implementation.

(3) Instead of recognising that the workers won a victory in winning the demand for House Rent Allowance—which was nullified in the 1972 agreement under the Ray Ministry by including the "element of House Rent Allowance" in the then wage rise of Rs 45.60, to which Basu's 'other central unions' were a party and against which only CITU and its allies registered a protest—Basu wants to belittle the victory. In whose interest?

(4) *Status quo* on workload till the Workload Committee makes its recommendations is a gain, since workload was being continuously increased even after the lifting of the Emergency.

(5) Basu does not know that CITU, AITUC, etc, fought in the 1974 general strike against his "other central unions" for grades and scales and got an assurance which was dishonoured by the Congress state government. He also seems to be unaware that grades and scales, where these do not exist, cannot be fixed overnight and a Committee has to go into the issue.

Basu is also blissfully unaware that the employers were not prepared to accept the proposition that the Labour Minister would finalise the workload and grades and scales after the Committee's recommendations are submitted and that the strike had to be prolonged to make the employers accept this position as also payment of gratuity for 15 days instead of 13 as was in vogue.

(6) Let me put it on record that it is only due to the CITU that shifts have not yet been increased to 19-20 in a week and that unless proper safeguards are provided and agreement reached, CITU will not agree to increase of shifts according to arrangements made by the employers.

NIREN GHOSH

President,
Bengal Chatkal Mazdoor Union (CITU),
Calcutta,
May 14.

The Police Take the Lid Off

Romesh Thapar

THE story goes the rounds that if Morarji Desai's government continues to perform at its present level of incompetence, there'll be a move to import foreign expertise—and then, probably, the lobbies will get to work to decide which expertise! It is incredible how the present state of break-down gets buried under a thick veneer of normality. Only the striking policemen have suddenly taken the lid off, as it were.

The leadership is not doing its job. The limited, tired, old men who rule in Delhi with the help of jaded, lack-lustre members of the IAS, do not have any idea of how to tackle the spreading breakdown. They live in some dream-world, passing strictures on those who are even more incompetent than them. A Morarji Desai can lecture the Akali leader, Badal, about "wider issues" when he is seeking a panicky settlement with the Punjab police, or attempt to advise the confused Madhya Pradesh ruling caucus obsessed with a local election, but the central fact of a national problem is lost in delays, in prevarication, in juggling with priorities.

A Police Commission, assigned a multitude of tasks, has been functioning for some time. It has been reporting to the Government of India. One would have thought that agitations could wait. Now it appears that the police "leaders" are merely using the interregnum to establish some kind of influence on the force, and to rouse public opinion about a long-neglected problem. Clearly, it needs working out—but with the assurance that the Police Commission's recommendations will be implemented. No such confidence exists in the force. The states of India, which control the police, have failed in every respect to attend to simple complaints about family housing, promotions and protection against political harassment.

The Janata government, with the active connivance of senior civil servants who imagine that they are know-alls, is making a mockery of its commissions and committees. At considerable cost, these bodies perform their task, moving over the sub-continent, interviewing hundreds of people and submitting carefully considered reports. Invariably, these documents are made a point of controversy in Parliament, referred to Cabinet sub-committees and the like, and emerge unrecognisable as bills. This is very far from democratic procedure, whatever the MPs think about it. It is a farce, subscribed to by all political parties—Right, Left, Centre.

Can we expect the aged leadership which holds the Janata party to ransom to reverse these procedures. Not at all. They nourish them in the interests of a continuing *status quo*. Take, for example, the vital and very special question of the autonomy of the radio and television. The PM is solidly opposed to the idea (in private, naturally). This Gandhian cannot change his ideas. Such a change would be a sign of weakness! The issue is not seen in the kind of strengthened democratic frame we wish to establish in the sub-continent. Radio and TV are equated to machine tools or hoteliering. It is a wall difficult to penetrate without some rather solid pressure exerted by the people.

And so it is with the Police Commission. Old IAS animosities are bound to puncture the proposals the Commission makes (Home Minister Patel's interventions, notwithstanding). The police demonstrations could well be designed to show who holds the aces. Are not Dharam Vira and Rustamji of the Police Commission being quoted by the angry policemen? When the full story emerges, it will be the ministers and bureaucrats who will be indicted, not the police.

Meanwhile, prices are rising. Some rise is inevitable in growth, but Minister Mohan Dharia (one of the younger ones!) needs to take a look at his own performance. At so many points, blackmarkets in essentials flourish and no effort is made to stamp them out. Does this government really believe that its job is to play it soft whenever any confrontation develops with the black-marketeer (small and big), the communal incendiary (both Muslim and Hindu), the striker-disruptor (of all parties), the protector of corruption (from Ministers downward), and the gangster in town and village (taking lessons from the sons and sons-in-law of various netas)? You would think that, like the politicians of the Cong(I), the Janata luminaries are seeking cheap popularity in the same circles. This is the truth—and represents populism with a disaster perspective.

At this rate of moral decline, deluged by the empty invocations of Morarji Desai, it will not be long before we begin to see the principled citizen as some kind of "nut". It is beginning to happen. When you protest the crazy harassment of even petty officials, the seniors smile a knowing smile. Justice Shah was absolutely in focus when he made the point recently that we are being ruled at bureaucratic level by rather inferior people. So much of our present crisis develops here and cannot be corrected by politicians who don't know what is what.

As an illustration, the government effort to curb wasteful expenditure is most instructive. Daily, statements are made about where the curbing is to be done or should be done. No one issues the orders to ban outriders, cut touring by half, cancel travel by air (and visits abroad!) for a large number of categories, put ceilings on telephone and electricity usage, restrict drastically the use of staff cars and forbid conferences in hill stations. The cost of all these inflated activities must be phenomenal. Or has all this become the over-and-above earning of our ruling "elite"?

And while we are engaged on these tasks, I think the police agitation should persuade us to start work on a wage structuring which will be relevant to our development needs. The only people who seem to look after themselves are the civil servants—and this is no advertisement for a government which has a huge finger in almost every pie. Great resentments are piling up among doctors, engineers and specialised cadres who have to spend several years in training when the "generalists" are chalking up seniorities. It is a decision which will have to be taken at political level.

These are the issues, but we continue obsessed with prohibition and cows, with the calculations of Indira Gandhi as to whose shoulders would help to fight an election, with Raj Narain's stupidities and the like. Actually, the mix is as always. But the condition of India is running down and may not for long provide us the familiar opportunities for political doodling.

Gloomy? Yes. But the situation now developing in Nepal provides a silver lining. At last, detentism is paying off, despite the warnings of the local "imperialists". Peking Radio should be interesting on the subject.

May 26

Keltron

KELTRON has introduced an all solid state 12 channel Keltron Television in the Bombay market. The all-solid state Keltron television set uses the latest modular construction for easy servicing, 80 semi-conductor devices, 51 cm picture tube with a high resolution capability by virtue of superior circuit design. The set incorporating 12 channels can be used anywhere in India where there is television transmission, with the selector switch put in the appropriate channel position. About 20,000 TV sets manufactured by Keltron in the last five years are already in Bombay homes.

New Pastures

Hansavivek

ORISSA CEMENT achieved 120 per cent of installed capacity utilisation during 1978 as against average utilisation of 89 per cent of the industry as a whole. Although production of clinker was lower at 3.97 lakh tonnes, against 4.22 lakh tonnes in the previous year, output of cement was marginally higher at 4.82 lakh tonnes against 4.75 lakh tonnes, and so were sales at 4.79 lakh tonnes against 4.77 lakh tonnes. But the directors complain that working results of the cement division were lower than in earlier years because of the increases in power tariff and wages and the imposition of excise duty on coal. Production in the refractory division was lower at 1.01 lakh tonnes, against 1.10 lakh tonnes previously; and sales were one lakh tonnes against 1.07 lakh tonnes. Both production and sales of cement products at the Rajganpur unit were considerably higher at 13,917 tonnes and 14,651 tonnes against 9,051 tonnes and 8,888 tonnes, respectively, in 1977. No production could be undertaken at the Mubarikpur unit, however, for want of orders. This unit had produced 5,189 tonnes and sold 7,662 tonnes in 1977. In 1978, its sales were barely 48 tonnes. The company's overall results, have been satisfactory with higher sales and profits. Net profit is Rs 2.10 crores (Rs 1.92 crores) and the unchanged dividend of 25 per cent is covered 2.94 times by earnings, as against 2.73 times previously. Under the award of arbitrators, workmen of the cement industry were given increases in wages and house rent allowance and certain other benefits, besides a lump sum amount in lieu of retrospective effect from March 1, 1977. The company has now received a charter of demands for revisions of wages etc from the employees in the refractory and cement products works. Bi-partite negotiations for a long-term settlement are in progress. The newly started electronics project is in progress. A new company under the name 'Vitroc Elektronics' has been incorporated to implement the project. Out of its initial equity capital of Rs 40 lakhs, the company has applied for shares worth Rs 10.40 lakhs. In regard to the proposal for starting a new travel agency, the directors now prefer to take over a running travel agency firm. The company has secured government approval for transfer of some of its fire clay mining leases to the subsidiary, Konarak Minerals. Approval is awaited for the remaining mining leases for fire clay and quartzite etc. The subsidiary has not yet commenced mining operations The company is considering a Rs 1.80 crore modernisation plan for the refractory division which would enable it to manufacture more sophisticated products to keep pace with the developments in steel manufacturing technology. No appreciable progress has been made in regard to the slag cement project because of uncertain availability of slag.

SANDVIK ASIA has reported that the revised estimate of the total cost of its programme of substanial expansion and modernisation is now about Rs 2.85 crores. The company has already spent Rs 1.58 crores last year. A gamma coating unit was installed and commissioned under the modernisation programme. The unit is used for coating a thin layer of higher wear-

resistant titanium carbide on the inserts. Such inserts give a considerably longer cutting life and can be used at higher cutting speeds. Government has permitted the company to complete the expansion programme upto the end of the current year. Orders have been placed for importing, installing and housing a spray drier unit. The unit, expected to be commissioned in the third quarter of this year, will improve the method of processing the tungsten carbide tips, bits and inserts and effect considerable savings through quality improvement and in the manufacturing costs. The company has also drawn up a scheme to set up a research and development cell in consultation with Sandvik AB, Sweden, at a cost of Rs 1.78 crores and is seeking the Central government's recognition for the project. With the issue of 16,500 new equity shares, of Rs 100 each, at a premium of Rs 150 per shares, as "rights" to Indian shareholders in June 1978 in accordance with the dilution formula, the non-resident interest in the paid-up equity capital of the company has been reduced to 54.86 per cent. During 1978, the company remarkably improved its performance with expansion of gross profit from the previous year's level of Rs 1.79 crores to Rs 3.67 crores, following a comparatively modest increase in sales from Rs 12.75 crores to Rs 15 95 crores. This outcome reflects a sharp increase in profit margins. Although tax liability has siphoned off much more, net profit at Rs 83 lakhs is more than 50 per cent better than last year's Rs 54 lakhs. Dividend, doubled to 20 per cent payable on the enlarged capital, is covered 1.84 times against 1.43 times previously. The company has been able to step up exports from Rs 65 lakhs to Rs 96 lakhs

CADBURY INDIA is going ahead with its apple juice concentrate project, near Baramulla in J and K, in technical collaboration with Bulmer's of UK. The project is expected to go on stream by mid-1980. With the assistance of Cadbury Schweppes UK, the company has identified major areas of research. The first project being undertaken seeks to evolve improved methods of fermenting cocoa beans. Meanwhile, acreage under cocoa plantation continues to rise and was estimated at 13,000 acres at the end of 1978. The country is expected to be self-sufficient for its bean requirements by the early 1980s, and surpluses are likely to be available for exports thereafter. The sal fat plant produced 1,438 tonnes which represented about 72 per cent of the installed capacity. The company has abandoned the marine processed products as, against its application for locating the project at Cochin, government insisted on installation of facilities at Ratnagiri in Maharashtra. Besides, the company was not permitted, even in the initial stages, to process the local catch without which the project was not considered viable. The company has produced good results for 1978 with higher sales and profits. Margins, however, turned lower than the previous year's. Dividend, raised by a point to 13 per cent, was covered 1.7 times. The company is issuing additional 5,15,808 new equity shares, of Rs 10 each, at a premium of Rs 2.50 per share. With this issue, the total paid-up capital will increase to Rs 3 crores out of which the non-resident shareholding will be Rs 1.20 crores and the Indian shareholding will be Rs 180 lakhs (60 per cent). The dilution required under the provisions of FERA will be thus completed this year.

ANTIFRICTION BEARINGS is putting up a plant at Bharuch in Gujarat for manufacture of 15 lakh taper roller bearing per annum. The company's present plant is at Lonavla in Maharashtra, with a licensed and installed capacity of 17.02 lakh ball thrust and roller bearings per annum. It has got a 'letter of intent' and is seeking its conversion into an industrial licence. Construction work has begun and the plant is expected to go on stream by the first quarter of 1980. To finance the project, the company has secured a foreign exchange loan worth about Rs 127 lakhs from ICICI, and has applied to GIIC and bankers for rupee finance. The company also proposes to raise Rs 50 lakhs by issuing 11 per cent redeemable cumulative preference shares of Rs 100 each. Another Rs 50 lakhs are proposed to be raised by the issue of 11 per cent secured debentures of Rs 100 each to the existing shareholders on a 'rights' basis to meet the working capital requirements. The company has fared well during 1978. Sales, profits and margins are all higher than in the previous year. The directors have stepped up dividend by two points to 17 per cent, which is covered 1.64 times by earnings.

HINDUSTAN LEVER's turnover increased from Rs 262 crores in 1977 to Rs 301 crores in 1978. This includes exports of about Rs 18 crores. The profit before tax increased from Rs 21.7 crores in 1977 to Rs 25.8 crores in 1978, and profit after tax from Rs 7.9 crores to Rs 9.8 crores. The company paid in October 1978 an interim dividend of 10 per cent *pro rata* according to the dates on which the shares became fully paid up. The Directors have now resolved to recommend a payment of 10 per cent by way of final dividend on the share capital as enhanced by the recent bonus issue, i e, Re 1 per share on shares which were fully paid up as on January 1, 1978, and the bonus shares allotted in respect of the same, and Re 0.795 per share on shares which became fully paid up on June 1, 1978, and the corresponding bonus shares.

MAHARASHTRA

Congress Still Supreme

CONGRESS reigns supreme in rural Maharashtra. Let there be no doubt about that. The zilla parishad and panchayat samiti elections, held in the third week of May and in which more than 20 million rural voters exercised their votes, have confirmed this fact. Janata party leaders are gloating over the fact that the ruling coalition in the state has managed to capture a majority of the zilla parishads. This way of looking at the election results only underscores the Janata party's pathetic compulsion to remain tied to Sharad Pawar's Congress for sheer survival.

There are now five factions of the Congress party in Maharashtra: Indira Congress, Congress (S), Sharad Pawar's Parallel Congress, Maharashtra Socialist Congress and Vidarbha Congress. If the seats won by these Congress parties are added up, the total crosses 850 out of the 1,212 seats. To complete the picture, one will also have to find out how many ex-Congressmen there are among the Janata winners. There are quite a few leaders in the Janata ranks in rural Maharashtra who are ready to bring out their hidden white caps and don them at the first opportunity.

Maharashtra has been a traditional bastion of the Congress party. It has remained so despite the fact that the party has been battered, demoralised and split into several warring factions. The zilla parishad elections are a clear indication of this. According to the number of seats won, the Janata party has finished a poor third, closely followed by the Congress (S). The first two places have gone to the Congress (I) and Sharad Pawar's Parallel Congress. The perfomance of the Janata party is significant in the context of its strength in the state assembly, where it is the largest single party, and the fact that it is the largest constituent of the ruling Progressive Democratic Front. But it is a party locked in the urban centres.

Politically, it was essential for the Janata party to mobilise votes in the rural areas and put up a good show in the zilla parishad elections, if it was to do away with its dependence on Sharad Pawar's Congress. It tried to assert its independence in the co-operative elections in the state in the last six months, but failed. It tried again in the zilla parishad elections and failed even more miserably. The Janata party could wrest a majority only in one district, Ratnagiri. It did comparatively well in the other two Konkan districts Kulaba and Thane, and in one Vidarbha district, Bhandara. But all this pales before the performance of the Congress (I) which won six zilla parishads and Sharad Pawar's Congress which bagged three. Even Swaran Singh's Congress had one district body in its pocket. The Janata party legislators were tired of playing second fiddle to Sharad Pawar's Congress in the uneasy coalition, in spite of their numerical superiority. The zilla parishad elections had presented a golden opportunity to them to put their foot down and show Sharad Pawar his place. In fact, the election results have condemned the Janata to continue in its secondary role in the government.

Of the 1,212 zilla parishad seats of which results were declared, the Congress (I) won 347 seats, Sharad Pawar's Congress 288, the Janata party 199, the Congress (S) 192, the PWP 49, the CPI 9, the CPI (M) 5 and independents, who include two factions of the Congress, 123.

Sharad Pawar has reason to congratulate himself on his party's performance. He has managed to kill several birds. The fifteen zilla parishads, including the two where elections were not due, where the PDF constituents have secured a majority, will in effect be ruled by his experienced followers. This is a great asset for the next assembly elections. Secondly, Pawar has dealt a severe blow to the official Congress in Maharashtra led by N M Tidke. Pawar's faction can now claim that the majority of Congressmen support him and not Tidke's faction. The Congress high command can ill afford to ignore this claim. Thirdly, by demonstrating his superiority over the Janata party in rural Maharashtra, Pawar can hope to nip in the bud attempts by some ambitious Janata leaders to dislodge him from the chief ministership. Indeed, some Janata leaders now confess that Pawar has ensured this position till the next assembly elections—that is, if nothing happens to the Janata party at the national level. Pawar's faction has also demonstrated that it is the only formidable rival to the Congress (I) in the state. The eight districts of Vidarbha have been the stronghold of the Congress (I). During the last assembly elections, the Congress had won a mere 11 per cent of the votes polled in that region. Congress veterans and ministers had lost their deposits. The resentment with the Congress was so intense that its leaders could not even hold election rallies. But now Pawar's group has shown that it has spread its roots in that area. It has secured 35 per cent of the votes polled in the zilla parishad elections in these districts.

The performance of the Congress (I) has been very impressive, though it failed to secure a majority in three of the Vidarbha districts. The party was badly riven with dissensions on the eve of the elections. Its top state leaders had abstained from the campaign. Its warring factions tried to defeat each other's candidates. And yet it has come out on top. This is largely attributable to Indira Gandhi's personal popularity which is still strong in Vidarbha and in the tribal areas of the state. The party wrested Dhule district in northern Maharashtra which has a considerable tribal population. Similarly, it did well in Thane, Nasik and Jalgaon districts where again the tribal proportion in the population is high. Besides, it is the only party which has not gone unrepresented in any of the districts.

The official Congress in the state is in deep mourning. It won only in Sangli and even here its victory is attributed to the personal pull of Vasantrao Patil, the former chief minister, who hails from this district. In Jalgaon, home district of Madhukarrao Chaudhari, former minister, the party fared well. But in the rest of the districts its performance has been miserable, especially considering its hold over the co-operatives and its standing in the old zilla parishads. The party is now in disarray and many of its leaders are eager to join hands with Sharad Pawar. Indeed, some leaders of Pawar's faction expect a big exodus to their party from the official Congress.

The Peasants and Workers' Party (PWP) had in the past been claiming to be the only viable opposition to the Congress in the state's rural areas. It spoke of its grassroots support. Its poor showing in the assembly elections was the first blow to its prestige. The results of the zilla parishad elections, in which it could secure only 49 seats all over the state, have now shattered its moral. In the assembly elections, the PWP had crossed swords with the Janata and contested a large number of seats in an apparent bid to capture power at the state level. As it turned out, the party had grossly overestimated its strength and in the process ruined the chances of a Janata government being formed in the state. The party has repeated the same mistake in the zilla parishad elections.

The PWP swears by its Marxist ideology. The two other left parties, the CPI and the CPI(M), have done even worse than the PWP. This has once more underscored the fact that the left has few bases in Maharashtra's rural areas.

Control of zilla parishads is a great help in assembly and parliamentary elections. The results of the zilla parishad elections are, therefore, of greater significance for the assembly elections of 1983 than the urban voter would like to believe.

PUNJAB

Policemen's Struggle for Rights

Sucha Singh Gill

Amar Singh Azad

TWENTY-EIGHT THOUSAND constables and 3,600 head constables are serving in the Punjab Police Department under miserable working conditions. These include long working hours without any compensation; no weekly, gazetted, or other holidays; humiliating and abusive behaviour by the officers and politicians, compulsion to work as household servants in officers' houses, etc.

Said one policeman: "Even after 30 years of Independence, policemen are treated as slaves by the officers and politicians." Another said: "They make us polish their shoes and wash their linen. We are worse than domestic servants and are not even given the opportunity to live with our families." The police rules framed by the British government are still being applied to policemen.

Economically they are miserably off. A constable is placed in a grade of Rs. 125-2½-150. This has now been revised, on the seventh day of the present agitation, to Rs 400-10-450-15-600-20-660. The head constable, who was placed on Rs 150-4-190, has now been conceded the grade of Rs 450-700. As a result of the agitation they will also get one month's additional salary in lieu of the gazetted holidays.

The constables, head constables and lower rank officers usually belong to the poor and middle peasantry and scheduled castes, whereas the higher rank officers belong to the rich peasantry, the business community, or the upper middle class employees' families. Most politicians of the ruling parties too belong to the same classes as the higher rank officers. Socially, culturally, and psychologically, higher rank officers and politicians are therefore very close. Moreover, the officers have to depend on the politicians for their transfers and promotions. The anti-social activities of the politicians, their relatives, and their friends are carried out with the active connivance of the police officers, who in turn obtain the active connivance of the constables, head constables, and ASIs.

This co-ordination between politicians, officials of different departments, and the police officials has increased over time. It reached its zenith during the Emergency.

The present tension in the police force is thus an expression of class contradictions. The consciousness among police constables about their basic human and democratic rights has increased over the last several years. One of the reasons may be the recruitment of better educated boys into the constabulary as a result of the rising unemployment of educated youth. This rising consciousness has expressed itself in posters, small protests, and demonstrations. In the recent past, posters have appeared at a number of places under the name of 'Punjab Police Union'. The biggest demand has been recognition of the union, which even the National Police Commission has favoured. Other demands are: (i) publication of the Police Commission's Report; (ii) eight-hour duty or extra money for extra work; (iii) grant of weekly, gazetted, and other kinds of holidays or compensation for it; (iv) end of insulting and abusive behaviour of officers and politicians; (v) recall of policemen doing domestic work at officers' houses; (vi) revision of pay-scales, rate of increments, and other allowances; (vii) provision of residential accommodation; and (viii) supply of terrycot uniforms.

In the recent past, there have been instances of Akali Jathedars and legislators, or their relatives and supporters, taking law into their hands and beating up policemen. On April 16, 150 policemen demonstrated in Patiala, shouting slogans against the government and the SSP. A day earlier, drunken relatives and friends of a local Akali MLA had severely beaten up and torn the uniform of a constable when he had tried to intervene in the fight between a rickshaw-puller and a drunken friend of the MLA. First, the SSP did not enter the complaint. When it was registered under pressure from the constables, the culprits were allowed pre-arrest bail. This incensed the policemen, and they took out a demonstration demanding arrest of the culprits.

The incident caused an uproar in the Assembly. The chief minister shamelessly denied the demonstration. The policemen contradicted the chief minister's statement. At Sangrur, a few weeks earlier, the jail guards had boycotted duties and organised dharna in front of the district jail, against the misbehaviour of an assistant superintendent of the jail. Four months earlier, after a similar incident, policemen had shouted slogans against the Punjab government at Kapurthala.

The current agitation of policemen can be understood only against this background. The agitation started at Patiala on May 8, with an eight-hour long demonstration and rally by 200 policemen. It was triggered off by the slapping and humiliation of a police constable on traffic duty on May 6 at Gobindgarh by an Akali MLA. The constable had committed the 'grave crime' of not saluting the MLA. The MLA alleged that the constable was drunk while on duty. This was proved baseless by a medical examination. The doctor on the contrary reported that the constable was running high fever which was the cause of his red eyes.

The demonstration caused so much terror in the bureaucracy of the police and

government that the Inspector General of Police himself came from Chandigarh to Patiala to order the policemen to disperse and return to the barracks. The policemen, who were in uniform, refused and shouted slogans against him and against 'afsarshai'.

The demonstration was the sparking point. The agitation spread to the whole of Punjab within two days. There were demonstrations and rallies in all district headquarters, tehsil headquarters, and other towns. It even spilled over to Haryana and Himachal Pradesh and now the involvement of UP and J and K police is evident as posters appear in these states. The Madhya Pradesh police too have started demonstrating for a hike in their pay-scales on the Punjab pattern. The policemen of Andhra Pradesh have also threatened to agitate.

The most noteworthy aspect of this agitation is that it has remained absolutely peaceful despite repeated provocations. This is in sharp contrast to the PAC revolt of UP. This agitation cannot be called a revolt because policemen did not even absent themselves from their duties. They simply came to the streets to demand certain democratic rights. Even so, officers at many places beat up the constables, dragged the Sikh boys by their hair and meted out other inhuman treatment. More than 800 have been arrested till now. The government plans to throw 2,000 out of jobs. Out of these, 300 have already been shunted out.

The Akali-Janata government has already decided to hold in camera trials in the jails to punish the agitators. This smacks of martial law administration. The government is not allowing even demonstrations. Wherever the Punjab Police Union plans to demonstrate, all the roads are blocked, all vehicles are searched for policemen and they are arrested. The Punjab Police Union which was formed by 40 district representatives in a secret meeting, has decided to put up prolonged resistance by courting arrests till the victimisation is ended and their demands are fulfilled.

This agitation has widespread roots. Though 4,000 are active, others are passively involved. Sympathies of lower rank officers, upto the rank of Inspector, are quite evident. The fact that all of Punjab has been handed over to the BSF and the CRP gives ample proof of this. For the control of armouries even the BSF and CRP have not been relied upon and the army has been called.

Another significant aspect of the situation is that, despite the harassment which the common man is generally subjected to by the policeman, an element of sympathy with the policeman and the anger against the government and the police bureaucracy is evident. Almost all progressive and democratic organisations, trade unions, student unions and kisan sabhas have expressed their sympathy with the agitating policemen. They have gone to the extent of demonstrating and courting arrests in support. A policeman remarked: "We feel that previously we were shunted out of the baradri [community], but since our agitation we are being welcomed back to it."

The dehumanising working conditions of the policemen and the conscious training they are given make them so rude and callous to their own class of people. The posters, the speeches at the rallies, and the slogans suggest that policemen are realising their alienation from the people and their use against the people by the government and the bureaucracy.

On the methods of tackling the agitation, the government and the bureaucracy are divided into two camps. The Inspector-General of Police wanted to call the army on the very first day of the demonstration at Patiala. He argued that protests by an armed body could only be tackled by a superior armed organisation. But the army could not be called on that day. This hard line of the IG is being supported by the RSS-Jana Sangh lobby (represented by Yagya Dutt Sharma and Balramji Dass Tandon), the fanatic section of Akali Dal (such as Atma Singh), and the 'hawk' landlord lobby (whose spokesman is Ravi Inder Singh, Speaker, State Assembly). This hard line has been dominant so far; and the BSF, CRP, and to some extent the Army are carrying it out.

A section of the bureaucracy and a few cabinet ministers are in favour of a soft line. They favour negotiations with the policemen and sympathetic consideration of their demands. Their argument is that a school master's attitude will not help, and that the times are gone when policemen could be treated like slaves or domestic servants.

On the seventh day of the agitation, the Punjab government announced an increase of Rs 100 in the salary of a newly recruited constable. The government has adopted the policy of 'carrot and stick'. On the one hand, it has announced economic concessions even more generous than what the Punjab Pay Commission has recommended. On the other hand, the government is bent upon teaching a lesson to those policemen who have dared to come to the streets: the arrests continue, while camera trials start in the jails; the list of dismissals and suspensions gets longer and longer with the target of two thousand.

Mere economic concessions, however, have failed to appease the policemen. Finding all other modes of protest blocked, they have now decided to prolong the stir and to court arrests. The agitation is bound to have widespread repercussions in the state and the country also. The police force, organised as a repressive tool by the ruling classes has recoiled on the ruling sections themselves. It has thus thoroughly exposed the undemocratic character of the government. The lower ranks of this disciplined force, who have been used in the past to suppress the poor masses and who have been meting out inhuman treatment to their own oppressed brethren, have now themsleves come out in the streets. And they have, in turn, received the support of the masses and their organisations.

BOMBAY

Keeping Them on the Move

ONE of the major factors responsible for the defeat of the Congress in the March 1977 polls was the programme of slum-demolition it had undertaken under the cover of Emergency, as part of Sanjay Gandhi's 5-point programme. Emergency rule in Delhi had come to be epitomised by the Turkman Gate outrage. In Bombay too the demolition of Janata Colony and the shunting of its 72,000 inhabitants to Cheetah Camp was an important plank of election propaganda of the Janata party in both the Lok Sabha and the Assembly elections. Four months ago, while laying the foundation stone of a housing complex in Delhi for some of the victims of the Turkman Gate demolitions, Morarji Desai had categorically stated that such "merciless demolitions" would never occur again. Addressing the Zopadpatti Punarvasan Parishad in Bombay on April 30, 1979, the Maharashtra chief minister too had expressed similar sentiments: "The state government will solve the issue only after a comprehensive formula is worked out in consultation with urban authorities, slumdwellers, and keeping in view of the general resources that can be mobilised for the task."

However, recent developments have belied all such assurances. The state cabinet decided last month to demolish without exception all hutments in greater Bombay constructed after January 1, 1976. Such a step would cover almost two lakh slumdwellers in Bombay. Also, on May 9 an ordinance was issued which empowers the Bombay Municipal Corporation to demolish any slum with a 24-hours notice. According to the provisions of the ordinance no specific notice to individual hutment residents need be given; a mere general notice addressed to the entire colony would be adequate before commencing the demolition work. The recent demolitions in Prajasatta Nagar in Antop Hill and Jayaprakash Nagar at Cuffe Parade have been thus duly sanctified by official approval.

It is not as if these slumdwellers occupied habitable, let alone hospitable, land. The slum at Antop Hill, for example, was till recently a large tract of marshy land. Grass grew waist-high and snakes and scorpions were the only 'residents'. The present residents cut the grass, filled up and levelled the area and made a home out of the wilderness. When they were thus labouring, there was no policeman to enquire about their 'occupation' nor was government keen on acquiring the land for any other purpose. But now that the land is 'settled', they have been rudely ejected and have had to watch their homes being levelled to the ground. The residents were of course given no advance notice of the demolition nor were any arrangements for alternative accommodation made, and when they decided as a last desperate measure to go on *dharna*, the event was ignored by the media. And when a delegation of residents met the local MLA and requested him to intervene, he flatly turned down their entreaties on the ground that they had "not consulted him" before building the zopadpatti!

The government occasionally also offers the victims of its slum demolition programme alternative sites claiming that the new sites provide better facilities of sanitation, lighting and water supply. This is seldom the case. The residents of Jayaprakash Nagar in Cuffe Parade, many of whom are workers in the Sassoon Docks, were shifted to Malvani, near Malad. Leave aside the fact that these workers have now to travel long distances for work; leave aside also the fact that the so-called facilities are hopelessly inadequate or do not exist at all; there have been instances when known residents of the demolished colony have been refused the 10' x 15' plot because of 'insufficient evidence', or for having lost the 'house-identification' receipt. In fact, there seems to be a racket in the allotment of the 'best' of these plots to those who could pay a little extra to the allotting authorities.

Two other colonies in Bombay that appear to be facing the prospect of demolition are Azad Nagar and Shri Ganesh Nagar that lie along the railway tracks from King's Circle to Mahim. Although Azad Nagar has existed for several years, the municipal maps still show the area as barren wasteland. Consequently the impending demolition will affect practically every hut in the colony. Also, huts that have been sub-divided after 1976 will be treated as post-1976 constructions and will be demolished with the rest. But indications are that the residents of these colonies will not passively watch their houses being torn down. The women of the colony seem particularly determined to resist the demolition scheme. "Let the 'sarkar' try to move us. These huts may be made of gunny-bags and sticks, but they are our homes. We will not let them touch even one of them. After having lived here all these years, do they think they can throw us out just like that?"

There are also signs that the resistance to demolition is getting better organised. On May 3, thousands of slumdwellers from all over Bombay organised a morcha to the Council Hall in protest against the cabinet's decision. The morcha was an elaborate and organised affair, the organisers beating a 'thali', and explaining to the residents the need to have such a morcha. "Once we are united, we will keep on fighting. We will tell the government, *tum hamari zhopdi todega, hum tumhari khopdi todega!*" (If you break our huts, we will break your skulls.)

DENA BANK

BOMBAY

9,36,16,959	v) On Bills of Exchange Rediscounted	9,38,76,015	

Notes forming part of the Accounts:

1. As per Actuarial Valuation the total Gratuity Liability of the Bank as on 31-12-1977 had been determined at Rs. 197.38 lakhs against which Rs. 50 lakhs have been provided and paid upto 31-12-1978. The accrued Gratuity Liability for the year ended 31-12-1978 has not been ascertained. Gratuity amounting to Rs. 9.26 lakhs paid during the year has been debited to Profit and Loss Account and included under the head 'Salaries, Allowances and Provident Fund, etc'.

1.2.1 Gratuity Fund established by the Bank has been approved by the Commissioner of Income-tax. According to the terms of approval the Bank is required to pay Rs. 155.94 lakhs to the Fund by 31-12-1979 being initial contribution towards liability upto 31-12-1974 and incremental liability for subsequent years. As against these, the Bank has paid Rs. 50.00 lakhs upto 31-12-1978.

1.2.2 In view of non-fulfilment of certain conditions of recognition of the Fund regarding payment of initial contribution, there may arise tax liability on Rs. 50 00 lakhs claimed in earlier years for which provision has not been made. However, the Bank has approached the Commissioner of Income-tax for waiver of non-fulfilment of the said conditions.

2. The total amount of frauds committed and detected upto 31-12-1978 is estimated at Rs. 79.15 lakhs for which the Bank has lodged insurance claims with the Insurance Companies. However, the Bank is not adequately insured and the amount of loss which the Bank may suffer on this account has not been ascertained. The total amount of provision made by the Bank as upto 31-12-1978 is Rs. 15.00 lakhs.

3. Branch adjustments include difference of substantial amounts in transactions (including carried forward from the past years) between the Head Office and Branches and between Branches and Branches. Since reconciliation of these difference have not been completed upto the date of the audit, full details could not be submitted to the auditors and the same has not been verified by them.

4. Accounts Receivable, Advance Payments, Pre-paid expenses, etc. include an amount of Rs. 381.93 lakhs—previous year Rs. 85.89 lakhs (inclusive of Rs. 46.17 lakhs being a part of the amount of Rs. 79.15 lakhs referred to in Note No. 2) in Clearing House Adjustment Account. This account has not been reconciled for the last several years. A part of the increase in the balance in this account is attributable to dislocation of Clearing of cheques at the year end. This figure of Rs. 381.93 lakhs has been substantially reduced in subsequent months.

5. At some Branches, Branch Adjustments includes old debit items on account of drafts paid without advice, which remained unadjusted upto the date of the audit.

6. At Head Office and some Branches, General Ledger Balances did not tally with some of the subsidiary ledgers/Schedules/Registers in respect of Deposits, Advances, etc.

7. Previous years figures have been re-grouped, re-arranged wherever necessary.

REPORT OF THE AUDITORS

TO THE PRESIDENT OF INDIA:

1 We have audited the attached Balance Sheet of DENA BANK as at 31st December 1978 and also the Profit and Loss Account of the Bank for the year ended upon that date, in which are incorporated the Returns of 23 Branches audited by us, 301 Branches audited by other Auditors and unaudited Returns in respect of 434 Branches not visited by us. The Branches audited by us and the Branches audited by other Auditors have been selected by the Bank in accordance with the guidelines issued to the Bank by the Reserve Bank of India.

2. The Balance Sheet and Profit and Loss Account have been drawn up in Forms "A" and "B" respectively of the Third Schedule to the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of Banking Companies prior to Nationalisation by virtue of the provisions of the said Act, as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that:

(a) Subject to notes 1 to 6, in our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank:

(i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December 1978 and

(ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the year covered by the Account;

(b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(c) The transactions of the Bank which have come to our notice have been within the powers of the Bank, and

(d) The Returns received from the offices and branches of the Bank have been found adequate for the purposes of our audit.

SINGHBHUM

Exploitation, Protest and Repression

THERE were a number of instances of police firing on adivasis in Chaibasa and oppression of landless labourers in the Baharagora area of Singhbhum in Bihar during the latter half of 1978. One person was killed on November 6, 1978 when the police opened fire on a gathering of adivasis near Ichahatu village; three persons were killed in police firing at the middle school in Serengda on November 25, 1978; at Baharagora, in another part of the district (which is not an adivasi area), the police and landlords together were reported to have unleashed terror on landless labourers trying to organise themselves to implement minimum wages and to face the tyranny of landlords. Large-scale arrests, beatings and molestation of women were reported through the latter part of 1978 and into 1979.

The Delhi unit of the People's Union for Civil Liberties (PUCL) decided to send a fact-finding team to make an on-the-spot study of these incidents in particular and the socio-economic conditions of the adivasis and landless labourers in general. In the course of its visit from March 2 to 10, the team visited Dhanbad, Jamshedpur, Chaibasa, Ichahatu, Goilkera, Serengda, Lonjo, Baharagora, Ranchi and Patna. The report of the team throws a flood of light on the exploitation of the adivasis and the systematic repression of any effort by the adivasis to protest against such exploitation.

Many Faces of Exploitation

Singhbhum is the southern-most part of Bihar, bordering on West Bengal and Orissa. It is part of the Chota Nagpur region towards one end of the adivasi region of India which stretches from Thana-Nasik in Maharashtra in the west to Bankura-Midnapur in West Bengal in the east. The Chota Nagpur area is a hilly region known for its abundant forest and mineral wealth. A substantial part of India's needs of coal, iron, steel, manganese, mica, china-clay, limestone, copper, uranium, lac and wood is met from this area.

The natural wealth of the area contrasts vividly with the desperate poverty of the adivasis who inhabit it. The adivasis are exploited at three levels. First in the market, the mahajans and traders exploit them by buying their produce cheap, and selling them goods dear. The adivasis who are by and large illiterate, have no outside contact and are virtually ignorant of the prevailing prices for their produce in the organised urban markets. The mahajans, on the other hand, employ agents in villages who assess the size of the season's produce and also have intimate contacts with market operators in urban markets. These contacts at the purchasing and selling points enable the mahajans and traders to make substantial profits. For example, the adivasi will exchange chiranji seed for five to ten times its weight in salt or at about a few rupees a kilo; this seed sells in the metropolitan markets for more than Rs 80 a kilo. The government authorities claim that they have introduced minimum prices for lac and are trying to fix support prices for other products, but the adivasi still remains at the mercy of the mahajans. The adivasis have a song which goes

"You enter our country thin as a needle,
You leave it thick as a ploughshare..."

Secondly, the adivasis are exploited when they offer themselves for a job and borrow 'dhan' (paddy) for family consumption. They receive wages which are considerably lower than the statutory minimum wages. Only the forest department and the Bihar Forest Development Corporation pay the minimum wages of Rs 4.80 a day. Contractors and private employers pay much less. Contractors who take saal seed, for example, were paying only Rs 1.50 a day till a year ago. The adivasi has to pay a high rate of interest on borrowings. We were told that interest is paid in kind; one maund of 'dhan' is to be repaid by one-and-a-half maunds of 'dhan' after six months. Thus, the interest rate is 50 per cent for six months, 125 per cent for a year.

The third form of exploitation is social; by the state, by the forest department, by the Forest Corporation, by the 'alien' administrators and by the outsiders. The state government derives about two-thirds of its revenues from the Chota Nagpur area but spends only about one-fifth in the area. This expenditure is almost wholly used in running the administration; very little is available for development purposes. The administration, which consists mainly of outsiders, is greatly resented by the adivasis. This resentment is not merely because of economic exploitation; it is rooted in the racial prejudices of the outsider who sees the adivasi as an inferior being, fit for nothing better than semi-slavery. The outsider adds insult to injury by terrorising the people, behaving arrogantly with them, not bothering to learn their language and sometimes raping or molesting adivasi women. The administration has also imposed an alien panchayat and mukhia system in the villages on top of the traditional manki-munda system, without properly educating the people about the new system. The result is that there are conflicting centres of authority in the villages.

Perhaps the most obvious form of organised intrusion into the lives of the adivasis is the operation of the Forest Corporation. Set up in 1975 to improve the exploitation of the state's forest wealth, the Corporation is a commercial operation which seeks to upgrade forests by planting teak trees. The forest department and the Corporation have for a long time been planting teak in the reserved forests in which the adivasis have few rights. Teak is more valuable from the point of view of the national economy than saal. The annual growth rate of teak is 50 per cent more than saal and the price differential per cubic feet of wood is at least 100 per cent. Recently the Corporation has begun to replace saal, mohun and other trees by teak in the miscellaneous forests which includes 'khuntkatti' forests, in which the adivasis have complete rights. The adivasis traditionally satisfy a range of their daily needs from the saal tree, its wood, its seed and its leaves. Saal is so necessary to the adivasi economy that it has the status of a religious symbol. But the teak plantations, except for the wages that may be paid in the course of the forest operation, completely bypass the adivasi economy. Teak is used elsewhere, it creates jobs elsewhere, and it creates wealth and incomes elsewhere.

All these forms of exploitation, in their totality, have given rise to organised as well as spontaneous protest from the adivasis. At the organised level, the movement to create a separate state, consisting of 16 districts in Orissa, West Bengal and Bihar, including Singhbhum, has attracted many of the national parties and representative bodies of the adivasis. The first attempts at organising a separate 'Jharkhand' ('jhar' stands for bushes and trees and 'khand' for the region) date back to 1939 when the Chota Nagpur Adivasi Mahasabha was formed. In the 1950s the Jharkhand party emerged as the largest single opposition in the Bihar assembly, but its strength has waned since then. Today the movement is a coalition of various parties and interests which have also attracted mahajans and big financiers who stand to gain from a separate Jharkhand state.

At the grass-roots level the movement is peaceful and democratic. It attracts the adivasis spontaneously because it meets their deepest needs. Slogans like 'Jai Jharkhand', 'Mahasul Nahin Denga', 'Eas Par Se Oos Par, Jao Bihari Ganga Par', 'Sagwan Ropai Band Karo', etc have been commonly used recently. The organised movement has been able to grow only because of this grass-roots support. The acceleration of the Jharkhand movement in the latter part of last year put renewed

pressure on the administration and the vested interests to give the adivasis a better deal. The administration and the vested groups responded by trying to crush the non-violent protest of the adivasis with violence. This is the common thread that has emerged from the incidents investigated by the PUCL team in the adivasi area of Singhbhum: the lathi charge in Goilkera on November 3, 1979; the firing in Ichahatu on November 6; the killings of Serengda on November 25; and the arrests at Lonjo on December 8.

Goilkera and Ichahatu Incidents

Goilkera is a medium-sized town, about 70 kms south of Chaibasa. A weekly market there attracts adivasis of neighbouring villages. Since August 1978 a movement has slowly developed against the payment of haat (weekly market) toll. On November 9, 1978, Ratnakar Naak, the local MLA, addressed a public meeting at the haat. He pointed out that in spite of repeated demands by the people the government had failed to provide facilities for sheds, drinking water, urinals, etc, at the haat. The collection of the toll is the prerogative of a contractor who bought it at last year's annual auction for Rs 10,000.

On the day of the incident, November 3, 1978 Lal Chand of Chakradharpur, the contractor, had an altercation with a tribal woman who had come to sell some vegetables, while he was collecting the toll. As the Acting SDO was present on the spot, he called the people to discuss the matter about the payment of haat toll. Without completing the discussion, the acting SDO allegedly became enraged and personally began to beat people with a lathi. He was joined in this by the police party. Many people including a number of women were injured in the beating. After this about 14 persons were arrested, including the Mukhias of Arasa and Serengda.

Ichahatu is a small village in hilly country about half-way down the Chaibasa-Goilkera forest road. It is a poor village of 25 families without much cultivable land, and its inhabitants are mostly dependent on forest produce. It is near Ichahatu on November 6, 1978 that some adivasis were fired on by the police, and one of them was killed. The PUCL team visited Ichahatu on March 4, 1979 and interviewed a large number of people. On the basis of these interviews it was able to reconstruct the happenings at Ichahatu on November 6, 1978 as follows:

The munda of Ichahatu had called a meeting of local adivasis for the morning of November 6 to discuss the plantation policy of the Bihar Forest Development Corporation, in particular to discuss what the people wanted to do about the policy of replacing saal forest with teak. The Ichahatu munda told us "we don't know why the government is cutting saal and replacing it with teak. We only know that saal is ours while the teak is not meant for us". The meeting was held on ryoti land about three kms from the Santara forest and about half a km from Ichahatu village. By mid-morning about 400 to 500 adivasis had collected and everyone the PUCL team talked to confirmed that "the villagers did not have arms". The villagers told the team that the BDO, an adivasi himself, had stayed the night in Ichahatu with a police party in anticipation of the meeting and before noon (about 11 am) he arrived at the site of the meeting accompanied by the daroga of the Goilkera police station. The BDO then talked to the Ichahatu munda who announced that the officials did not want the meeting, that he was assured no more teak would be planted, and that the meeting was over. The Ichahatu munda left almost immediately for his fields, the crowd started dispersing and the BDO and the police left to return to Goilkera.

The assembled villagers were slow to disperse and others were still arriving when suddenly at about 3 pm the BDO and the police party returned in three vehicles, this time in the company of some forest officials. The forest officials stayed in their vehicle but the BDO, daroga and some armed policemen got down. The BDO began to order the villagers to disperse immediately. The daroga was reported to have suddenly fired his revolver in the air. The munda of Noongri rushed forward at that time and waved his hands to indicate that there was no need to fire and they were dispersing. But within a few seconds the police fired into the crowd killing Maheswar Jamoda of Noongri village and wounding Antu Marla of nearby Kasi Jora village. There was no warning, no lathi charge and no tear gassing.

The police picked up the body of Maheswar Jamoda and collected the unconscious Antu Marla and took them away. They then went on a spree, arresting people indiscriminately. The scared villagers had fled when the firing started and nobody else was arrested from the site of the meeting. Nine people were arrested altogether as the police returned to Chaibasa. Some were picked up from the forest roads.

Incidents at Serengda and Lonjo

Serengda, a village with a middle school, nestles in rich saal forest close to the Koel river. A stone's throw from the village is a naked hill slope where the Bihar Forest Development Corporation has cut down saal and planted teak saplings. The saplings are still shoulder high, and the barren hill is a daily reminder to the villagers of the interference in their lives. It was in this village on November 25 last year that police firing killed three people.

Last year, on Gandhi's birthday, the villagers of Serengda responded to the call of the movement by symbolically cutting down some saplings in a nearby teak nursery. They were also alleged to have burnt down some temporary jhuggis. The police in the area identified Shailendra Mahto, a young man in his twenties, as the leader of the movement in the area. He is charged with a long list of crimes and is wanted by the police.

After the October incident a small police detachment was at first posted at Serengda. Subsequently, this was replaced by regular daily patrolling along the main Goilkera-Serengda road, a distance of about 29 kms. On November 25 last year, a Saturday and the day of the Serengda weekly market, a strong police party of about a dozen armed men accompanied by the Block Development Officer of Goilkera came to the village and made themselves at home in the verandah of the school a few metres from the market and in full view of it, watching a thousand or more villagers doing their week's shopping.

As was usual, the village 'dakua' (dugdugiwala or crier), Boas Lumda, who makes public announcements for a fee of fifty paise, was at the market. He told us that a chowkidar of the village asked him to make two announcements. First, he asked him to proclaim that prohibitory orders had been promulgated forbidding public meetings, and a little while later that there would be a public meeting the very next day, Sunday, November 26 at nearby Jato village, which would be addressed by Begum Sumbrui, the local Member of Parliament, and others. A pamphlet announcing the meeting was distributed.

Boas Lumda says that after he made the announcements, some of the constables came to him and said that the daroga wanted to see him. He went to the school verandah and the daroga roughly asked him why he was announcing a public meeting when section 144 was in force. Along with the questioning he was dealt a few lathi blows. At this, "I got up and ran back into the market", said Boas Lumda. He was pursued by the police, caught hold of, and dragged back to the school verandah. All this angered the villagers in the market and some came to the school to find out why the police was "beating our man". There were sharp exchanges between the police and the crowd which had become pretty thick by this time with people coming from the market. The villagers demanded that the police release Boas Lumda.

Instead, the police opened fire, in all 12 rounds. As in Ichahatu there was

no warning, no lathi charge, no tear gas. The first few shots were fired into the air, and went through the wooden beams of the school verandah. The beams have since been replaced. And this was the first repair of the school building ever since it was constructed by the villagers. The next few rounds were then fired at the crowd. Two men, Somnath Lumga (25) of Serengda and Dukia Honga (45) of Tenda village were killed. A young boy, Lupa Buhr (12) was also shot dead. One of the injured, Maghi Munda, a frightened old man who looks more than 70, told the PUCL team that he had come to the market to buy some tomatoes and was returning home, past the school when the shooting broke out and he was injured.

Lonjo, a village of about 400 homes in three clusters, about five kms from the Sonua railway station on the main Calcutta-Bombay railway line, illustrates the arrogance with which the police and authorities treat the adivasis of Chota Nagpur and their customs. Shailendra Mahto features in this incident as well. On December 1, 1978, he visited Lonjo village in connection with an on-going agitation under the banner of the Jharkhand movement. A few weeks earlier the residents of Lonjo village had participated in the symbolic cutting of teak saplings in a nearby nursery. They had, before that, taken part in an agitation to guarantee the supply of bamboo to the large community of weavers in the area when the supply was disrupted by the activities of a private paper manufacturing concern.

The police learnt of Shailendra Mahto's visit and, believing him still to be at the village, paid a visit the following morning, December 2, at 4 pm. The police party was led by the daroga of Sonua police station. He let his men without warrant or warning to the house of Damo Sundi, a prominent resident of the village and searched his premises, rudely waking up the women and children. Not finding the man they were seeking, the police party then proceeded to the home of Durga Sundi whose young son is alleged by the police to be a friend of Shailendra Mahto. Durga Sundi told the PUCL team that the police misbehaved in the same manner as they had done at Damo Sundi's house, besides intruding into the family prayer room—a sacred spot where no outsider is permitted.

Indignant at this highhanded behaviour two young men, who know how to read and write, wrote a letter of protest on behalf of the village Munda, Motai Digi, to the Deputy Commissioner. They sent copies to other appropriate authorities including the Sonua police station. In this letter the Munda, who signed it, complained about the instructions and asked, "Do you think this was a justifiable act on the part of the police?" He wrote that as Munda he was demanding an explanation of this unlawful intrusion which was totally prohibited by an Act of 1833 which had not been repealed.

The next thing they knew, on the morning of December 8, the daroga was back at the village with another police party at exactly the same time. This time they went to the homes of the concerned people, pushed their way in, upset grain bins, woke up everybody and took Durga Sundi, Damo Sundi and the Munda, Motai Digi, with them to Sonua police station. There they were all abused and threatened for having insulted the police by writing a complaint and taken to Chaibasa in handcuffs. Durga Sundi was asked in Chaibasa to copy the ill-fated letter of complaint. They were kept in jail till January 22, 1979 when they were released on bail of Rs 650 each.

Police Terror in Baharagora

The area under Baharagora thana, about 90 kms from Jamshedpur, constitutes the eastern end of Singhbhum district. It borders Bengal and Orissa, with the Suvarnarekha river flowing across into Bengal. In spite of its proximity to the river, the land in this area is generally rugged and not very fertile because of lack of irrigation. Most of the area is monocrop, growing paddy. Control over land is extremely unequal. For instance, in Olda village, the biggest landowner possessed over 35 acres of land, while most of the villagers had less than 3.5 acres and out of a total of 120 households about one-third had no land whatsoever.

During the last six months, a democratic movement for the implementation of minimum wage to agricultural labour has gathered momentum in this area. This movement is led by the Kisan Samitis of the CPI(ML). As a consequence of this movement the prosperous landowners have been antagonised. They are using their goondas and the local police to terrorise the Kisan Samiti activists and break up the movement. So far the police have arrested 35 Kisan Samiti activists and are wanting to arrest another 41 activists. Besides, beatings, harassment, breaking-in and assault on workers continues regularly. From its interviews with different sections of the people in four villages (Kumardubi, Jaganathpur, Gaharamora and Olda), the PUCL team was able to gauge the extent of police-landlord terror that reigns in this area.

Bhujanga Das, a 26 year old graduate, is the Mukhia of Kumardubi village. He is convinced that the police at the behest of the landowners are harassing and victimising those associated with the minimum wage movement. He stated that there was no demand for wage increase in his own village, where the rate had been 2½ to 3 kgs of rice per day while the statutory minimum wage is 5½ kgs of rice per day. But in neighbouring villages like Parulia and Jaganathpur, much less used to be given. Wages there used to be 1 to 1½ kgs of rice per day; but after the movement women get 2½ kgs while men get 3 kgs of rice per day. However, even now some people force the labourers to sign for 3 kgs while giving them only 2 kgs. The Mukhia said that since the time he began participating in the Kisan Samiti movement, all the prosperous landowners and even his better-off relatives had become hostile to him. On November 29, 1978 he was arrested in Ekdai at about noon, while passing the police camp. He was not shown any warrant, nor were any reasons stated for taking him into custody. The night before the PUCL team met him, ie, March 6, the police had come and searched some of the houses of activists. The police also beat up several women. A poor peasant was arrested when he could not furnish information to the police about activists.

Similar tales of landlord-police terror were narrated to the PUCL team in Jaganathpur. The case of Sulobale, over 70 years old, epitomises the attitude of the police. The old woman was in a

state of shock and consequently could not remember exact dates. But, according to her, the police had come with Shashodhar Pal, a notorious landowner of the area, to her little wayside cafeteria. They had beaten her and did not spare even her young grandson, broken up her shop and taken away money which had been given to her the day before by her son who works in the Musabohi copper factory and had received his bonus that day. Her things have been attached. The police were looking for Satya Dolui (30) her absconding son-in-law, alleged to be a 'naxalite'. The old woman frequently broke down during the interview.

In the next village which the team visited, Olda, a number of men and women testified that the police often swooped on the village at night, searched houses and beat up people arbitrarily. A number of people—Miloo Singh, Tarapade Pardhan, Haripada Das and Kamal Das—had been arrested from the village. Others like Prafulla Das, Sutia Das, Guhia Singh and Arjun Singh were still wanted by the police. These were mostly Kisan Samiti workers. Their relatives suffered constant harassment by the police. The sister of one of the activists arrested was taken by the police to Jaipura panchayat where she was interrogated by the ASI. Her brother, presently out on bail, had been beaten up by the police while in custody. Another woman complained that her son could not return to the village because of threats from the musclemen of the landlord. His only fault is that he is the son of an activist who has been arrested.

Karunakar Mahapatra is a prosperous landowner and moneylender of Gaharamora village. According to the landless labourers whom the PUCL team interviewed, some members of the Kisan Samiti (Kamal Das, Sujoy Jha, etc) went to the house of Mahapatra on November 18 to recover some mortgaged articles of one Ajambar Naik who had died recently. They were able to recover some of the mortgaged articles that day, but Mahapatra asked them to come the next day for the rest. When they arrived on the following day, they found that some goondas had been mustered, who captured Kamal Das and took him to the house of Raghunath Singh, another big landowner in the nearby village of Naya Basan. On hearing this, about 3,500 to 5,000 people gathered spontaneously and went in a procession to Raghunath Singh's house. The goondas opened fire on the crowd and 9 members of the procession, including 3 women, were injured. Soon after the police came, freed Kamal Das and dispersed the procession. But Sujoy and Kamal lodged a complaint with the police. On November 21, three of Raghunath Singh's men were declared missing and the police imposed section 144 on the area. Three days later, the bodies of the missing men were found on the bank of the Suvarnareka. Within a couple of days the CPI(ML) was charged with the murder of the goondas and Moni Chakravorty, who has been twenty years in the area organising the people, was arrested along with 11 others.

A tribal couple was arrested on December 26 and severely beaten up by ASI Natobar Singh. Their fault was that they had given evidence before the SDO on December 3 when some leaders were conducting an enquiry into the happenings in the area. An innocent bystander was arrested for bringing food to them at their request, since they had not been given any food for two days in the thana. The couple are still in jail in Jamshedpur. On February 3, a police force went to Ghaspada-Brahmankundu, a village near the Bengal border, where it had been reported that 250 naxalites from Bengal had crossed over. These 250 were no more than people who were buying fireworks from the village for the festival of Makar Sankranti the next day. But the police descended on the village and beat up people indiscriminately, including a number of women, on grounds of sheltering 'naxalites'.

All the evidence set forth above indicates the reign of terror in the Baharagora area which is being perpetrated by the landowners and their retainers along with the police. While the police as an arm of law, is supposed to remain impartial and maintain law and order, it seems to be intent only on protecting the interests of the landowners and the rural elite.

INTERNATIONAL AFFAIRS

No Room for Euphoria

GPD

THE seven-week-long student agitation in Nepal has culminated in the commitment on the part of the King that a nationwide referendum will be held to decide whether Nepal should have a multi-party (and hopefully parliamentary) democracy in place of the present Panchayat system. Now the Prime Minister Kirti Nidhi Bista has resigned, one more sign that the agitation has been successful. One more absolute monarchy is due to fall. It has not fallen in the same way as the Persian monarchy fell earlier this year. It has rather shown readiness to transform itself into a constitutional monarchy. Whatever be the outcome of the referendum, it seems reasonable to assume that the end of the absolute monarchy is in sight. The Himalayan Kingdom will change its political system peacefully and in an orderly manner if the referendum is fair and independent, violently if it is rigged. There is as yet no reason to assume the worse to be more likely. A parliament and a multi-party system are due to make their reappearance in Nepal. A movement away from feudal absolutism to bourgeois democracy is no doubt a sign of progress.

To an extent this movement is not very different from what happened in our own country. A parliamentary democracy was subverted by Indira Gandhi. She could not, however, transform our political system into a feudal hereditary monarchy, much as she wanted it. The Prince Royal was projected with all the necessary fanfare. But she could not carry the coup through to its end. The results of the 1977 elections shattered her dreams and political future, hers as well as her beloved son's. A peculiar combination of political forces called the Janata came to power.

The story is much too wellknown. The semi-fascist youth of Sanjay Gandhi were overthrown. A section of the former cohorts of Indira Gandhi, being cleverer opportunists, quickly abandoned her and joined the new democratic wave. That became the Swaran Singh Congress and so on. The semi-fascists of the RSS now took over.

The Janata phenomenon did succeed in exposing and throwing away the "progressive" feudal designs of the Indira Gandhi dynasty. But that is about all. It did not take long for the inept Janata leaders to undo what the people of India had done in 1977. Lest anybody has any illusions about the Janata, the semi-fascists of the RSS are bent upon demonstrating that the difference between dynastic rule and parliamentary democracy may not, after all, be all that great.

One must wonder if the people of Nepal are also not in for a similar experience. The king of Nepal is not as clever as Indira Gandhi. Had he been so, he would have made appropriate anti-American noises (and privately had deals with them), would have cultivated a body of leftists and intellectuals around him to sing praises to his achievements. He did not learn enough from India! He could have emulated the Indians in at least one respect. One of the dependable tricks of survival is to hire intellectuals (the more left they are, the better) and create a climate of opinion that all opposition to the throne is inspired and financed by the CIA and the US government. The Americans then get angry and call you anti-democratic. In the progressive assemblies of the world, particularly in the third world, you can justify any authoritarianism by simply

quoting a few American statements against you.

The King of Nepal did not learn the tricks of the trade and is paying the price for it. It would be difficult for him now ever to expect a spell of absolute power. That game is lost.

But what next? One does not know if the Nepalese people would get anything more than Parliamentary democracy. The same people who dominated the Panchayats would in all probability come back again. After all, here in our land more than half (the number should be much larger by now) the people who waxed eloquent in praise of Indira Gandhi and Emergency would not even claim knowledge of this person. These people seem to be doing fine under the new dispensation. They are singing glory to democracy. Something similar is going to happen in Nepal. One cannot and should not be ecstatic about the developments in Nepal as some people were here in 1977. 1977 was *not* a year of revolution. 1979 is *not* going to be a year of revolution either.

1979 has another significance too. The Shah of Iran was overthrown early this year. While there is no denying the enormous sacrifices that the people of Iran made to overthrow the Shah, it should at the same time be remembered that it was *not* a revolution. The Islamic revolution is one large myth which Khomeini has created, a myth which will land Iran ultimately in the Western embrace. Once West Europe comes in, the US cannot be far behind. After all, the fact that Khomeini was welcome in Paris after being forced to leave Iraq is not an insignificant fact. One Shah will go. He will be replaced by a so-called Islamic revolutionary, and so on. Nothing much would have ultimately changed. Terms like Hindu revolution, Islamic revolution or Christian revolution are a great hoax. The Western intellectuals have already started using the hoax. The media will follow suit and ultimately the Western governments will take it over along with the oil.

It is strange but true that these suspensions of democratic rights either by Indira Gandhis or by the kings of Nepal or by the Shahs of Persia contribute in the last analysis to the consolidation of Western influence in the areas of concern. In Iran, Americans were wrong in backing the Shah. But were they really? The price for Shah's misdeeds was not paid by them. It was paid by the Iranian people. And who can say that Iran is permanently lost to them? Islamic revolution, whatever that term might mean, will end ultimately in Washington's lap if the hoax of Islamic revolution itself is not controlled in time. Something similar has happened in India. Indira Gandhi and her beloved son and their opportunist followers (of that time) created a situation in which the West benefited and still continues to benefit.

In Nepal the story may not be very different. The advanced industrial Western nations seem to have developed a foolproof strategy: something like a heads-I-win-tails-*you-lose-strategy. They support the existing rulers to the hilt and get the best. Then comes a so-called "revolutionary" wave. Allow a little time for the internal contradictions within the wave to develop and the "democrats" and the "revolutionaries"—Islamic or otherwise—ultimately find their way to Bonn, Paris, London and Washington, or more precisely are put through Bonn, Paris and London to Washington.*

I am not suggesting that overthrow of an autocratic system is a small achievement. But the trouble starts when that is the be-all and end-all of the movement. Then the victory in a battle is mistaken for a victory in the war. This has happened in India. On a bloodier scale, this is what has happened in Iran. A similar thing, one fears, is in process in Nepal. The only saving grace of the situation in Nepal—if it could be called that—is that there are fortunately not enough clever and callous intellectuals who proclaim the arrival of "the revolution through the ballot box" or the "Islamic revolution". The Nepalese seem to be using the word revolution quite sparingly. So far this is the case. How long it will last, one does not know.

The American prestige and the political games they like to play are today safer than ever. Fortunately for them the Shahs of Persia, Indira Gandhis of India or the kings of Nepal create a situation in which regaining basic political rights itself becomes an onerous task. With the intellectuals and the media which are about ten years ahead of the Western government and have enough allies in the third world, a climate is created that the struggle to regain these rights (quite often suppressed with the full blessings of the Western governments and, as in case of India, with those of the Soviet Union as well) itself is revolutionary and their achievement "a revolution". Once this happens, those people in these societies who may think that the revolution has to be more scientifically defined are put on the defensive. What is worse is that after such legitimate and great uprisings as in Iran, they are forced to carry on their search for genuine revolution in greater loneliness.

That is perhaps unavoidable. The least we can do in the meanwhile is to see that a great euphoria is not built around what are only the first faltering steps in the right direction whether in India or in Iran or now in Nepal.

Muddled View from the Top

R S Morkhandikar

hanging India by Sankar Ghose; Allied Publishers, Bombay, 1978; pp 290, Rs 60.

WHEN a politician with some claims to scholarship, especially one who occupied ministerial positions during the critical years of 1972-77, writes a book on India's changing political and economic scene, one hopes to gain some insight into the decision-making process in the country, or at least to read an analysis of the political and economic crises that the country went through. Any one who takes up Sankar Ghose's "Changing India" with some such expectation is bound to be disappointed. The book is old matter in a new jacket. Three-fourth of the book contains material taken from the author's three other books published earlier.[1] Whole paragraphs, with a few sentences dropped or added, from these books have been incorporated under new chapter titles. Since the book does not carry a preface or an introduction, one is at a loss to understand what prompted the author to compile this book when he had so little new to say. A few paragraphs about the policies of the Janata government have been added wherever necessary.

The first two parts of the book are devoted to surveying India's experience with planning and the strategies of development adopted. Tracing Nehru's concept of socialism to his pre-independence days' thinking, the author gives him credit for introducing planning with a view to bringing about a socialistic pattern of society. Once in power, Nehru had to scale down his socialist ambitions in view of pragmatic party compulsions and his own inclinations towards individualism and democracy. In effect, he opted for a mixed economy and a limited amount of state capitalism. After giving a detailed description of the Five-Year Plans, targets achieved and difficulties encountered, the author briefly mentions criticism of these Plans levelled by the Janata party, *viz*, not generating enough job opportunities because of the capital intensive technology used and neglect of the rural sector. In reply, all that the author does is to point at the Community development experiment and to marshal statistics in order to prove growth in income and agricultural production, land reforms, etc.

The author admits that "balanced growth is a logical ingredient of the very concept of planning", yet, by his own admission, this was recognised only at the beginning of the Third Plan in 1965 when the NDC found 246 districts industrially backward. (This constitutes an implied criticism of planning in Nehru era which emphasised economic growth at the cost of regional balance.) This defect was sought to be remedied by providing incentives to industrialists to start industries in those regions and by locating Central government projects there. Yet, merely locating industries in a region does not make the region developed. Licensing and farming out Central assistance to states were other instruments used. The actual record, however, shows that even after 1968 bulk of Central assistance went to the developed rather than the backward states.[2]

The author also concedes the imbalance in rural development. He quite rightly points out two kinds of handicaps suffered by the marginal and small farmers and agricultural labourers in rural areas: (1) Lack of capital resources and (ii) weaker political influence. Yet, the only remedy offered by him and his government was the 20-Point Programme of which land reform was an important ingredient. How, without the requisite pressure of political influence from the people, these and other reforms were expected to be implemented the author does not care to explain.

In general, the method employed by the author to depict economic changes is to give a didactic account of the Five-Year Plans, statistics relating to growth in scattered fields and a list of legal and policy provisions made by the successive governments. It would have been a more fruitful exercise if he had attempted to find the actual results achieved. For then he would have found that 48 per cent of the people still continue to live below the poverty line; that both in 1971-72 as in 1961-62, in rural areas, the poorest 10 per cent of the households owned 0.1 per cent of all rural assets while the richest 10 per cent owned over 50 per cent; that as of July 1977 only 1.27 million acres out of a conservative estimate of 5.32 million acres of surplus land had been distributed; that assets of 20 business houses increased from about Rs 2,500 crores to Rs 4,500 crores between 1969 and 1975; that chronic unemployment increased from 3.61 million in 1971 to 3.87 million in 1973 and to 4.37 million in 1978. And he would have had to conclude, in the words of the Draft Sixth Plan: "The most important objectives of planning have not been achieved; the most cherished goals seem to be almost as distant today as when we set out on the road to planned development."

Of the political changes, the 1969 Congress split, United Front experiments of 1967, the Constitutional Amendments, Indo-Pak war and the events leading to the Emergency and the 1977 Elections are factually described. After giving a chronological account of the Congress split, Ghose feels that "though the clash of personalities and the desire to retain power played their part... the clash of ideas and attitudes was mainly responsible for it". But in view of the fact that the Prime Minister's 'stray thoughts' note was approved by the AICC at Bangalore, Indira Gandhi's own statement of August 19, 1969 appears to reveal a more convincing reason. She saw the nomination of Sanjeeva Reddy for Presidentship as her "demotion in the organisation" and decided to fight back because "the Prime Minister must have [pre-eminent] position". The perceptions of different parties are interesting. The CPI saw in the split a victory of progressive forces over right reactionaries, while the CPI(M) regarded it as a factional struggle. The Jana Sangh and the Swatantra viewed it as proof of the increasing influence of the Communists over Indira Gandhi.

The working of the United Front governments in West Bengal and Kerala is traced to point out that the main cause of their breakdown was the suspicion that one of the partners was using power to serve its organisational and political interests; nor was there a clear understanding of the principle of coalitions. As a matter of fact, where the bases of the parties in a coalition were the same, conflicts were greater. Thus ideologically closer political parties like the CPI and CPI(M) could not get along well. Whereas, those ideologically far apart like the Congress, the CPI and the Muslim League or the Jana Sangh and Akali Dal could work harmoniously for long periods. This lesson, however, is not clear to the author. The idea of polarisation of forces seems to hold his fancy. He sees 1977 as the culmination of the process of political polarisation started in 1967. How, with all the socialists and the 'progressives' from the pre-1977 Congress, the Janata can be regarded as an ideological pole is not clear. After a rather one-sided account of the events leading to the Emergency and the 1977 Elections the author holds the excesses in implementing family planning, slum clearance, political arrests and pre-censorship as the factors mainly responsible for the Congress defeat. Absence of these excesses as also of RSS strength in South India, in his view, accounts for Congress victory there. This facile explanation does not account for Congress reverses in

Gujarat, Tamil Nadu or West Bengal. It also seems to give greater credit to the RSS cadres than is their due.

The last section of the book describes, with the help of long extracts from speeches and writings of leaders, the different brands of socialism in India—pragmatic socialism of the Congress, Gandhian socialism of the Janata and scientific socialism of the CPI and the CPI(M).

All in all, the book does not give a clear picture of the direction or quantum of change taking place in India.

Kingship, Territory and Property in Pre-British Bundelkhand

Ravindra K Jain

The social, political and cultural features of pre-British indigenous kingdoms in Bundelkhand were characterised by (1) descent-based rule; (2) procedures for the legitimisation of power into authority not subsumed by a purely caste model; and (3) relatively loose political integration with the centralised paramount politics dominated by the Moghul empire.

This paper, which is essentially a case study of the Kingdom of Panna founded by Maharaja Chhatrasal (1649-1731) in an isolated tract of the Bundela region, examines these socio-political features of pre-British Bundelkhand and relates them to the concepts of kingship, territory and property prevalent in those times in that region.

Introduction

ALL the three terms in the title of this paper—kingship, territory and property—have suffered from neglect in the sociological and social anthropological analyses of Indian society. In the view of some scholars the nature of the institution of kingship as it might bear on an understanding of 'modern' Indian society and history is obscure. Louis Dumont's attitude is representative of this class: "As the royal function can hardly be observed nowadays, there is paucity of anthropological literature on this topic.... A picture of the whole would require that the extensive modern historical literature be brought into focus from a sociological point of view" (Dumont, 1970:310). On the other hand, there is the attitude of anthropologists like F G Bailey who have, in opposition to Dumont's stress on ideology and ritual status in Indian society brought into focus the changing institutional context of political behaviour. In his anthropological field studies of this topic in Orissa, Bailey imposes at the very outset a typological grid contrasting the tribal system of the Kond with the caste system of the Warriors even though an effort is made to discern interactions between the two systems in a political field within a changing arena dominated successively by (British) administration and political democracy (Bailey, 1960). Like many analysts before and after him, Bailey holds an oversimplified picture of pre-British rural socio-economic structure, emphasising the great gulf between the State and the Village as "separate worlds" (Bailey, 1957:4). Interestingly enough, within his typological framework of tribe and caste he comes close to recognising that "a part of Oriya political life must be seen as a segmentary system. In most Oriya villages in the Kondmals the dominant caste are the Warriors. If we view all the villages as part of an interacting whole, then the links between the dominant landowning caste-groups in each village are segmentary: they resemble structurally the links between Kond clan territories" (Bailey, 1961:13). However, as far as the overall political structure of the tributary states of Orissa is concerned, Bailey is unable to translate this formal resemblance into historical terms. As a first step, each Oriya state would provide the concrete locus for treating "the villages as part of an interacting whole", and each state could be formally located in a segmentary structure of kingdom formation.

But in this respect Bailey, like most students of the ethno-history of pre-British India, works under a severe handicap. The only reports about these states and kingdoms written in English were composed by colonial officials. They made drastic summaries of a complex situation which, lacking language proficiency and scholarly motivation, they could not grasp fully. In the last chapter of his book "Caste and the Economic Frontier", Bailey grapples with the meagre information on pre-British administration land-tenure in tributary states of Orissa provided by Hunter and Macpherson, but is unable to decide whether or not sale of land was usual before 1855. As a social anthropologist he is interested in comparison; thus he observes, "In Bisipara a system of land-tenure probably similar to that of Zululand has fallen down before the play of market forces and legislative encouragement of private rights" (Bailey, 1957:244), and in a footnote, that "the Raja was the spiritual head of Oriyas in the Kondmals" (*Ibid*, 251). These are significant observations and we shall follow their implications in the analysis of data from the Bundelkhand region.

A legacy of the colonial officials' reports on the working of indigenous political system was to portray these politics as being in a state of anarchy. Indeed these accounts would make it difficult to even speak of a 'system'. Cohn (1962) and Shah (1964) provide much needed correctives to restore a sense of coherence in this area of study. It is relatively easy to see the reasons why Cohn does not explicate the nature of kingship in the Banaras region. When we first hear of the Raja of Banaras in the early 18th century, it is already in the context of what Cohn terms as "the secondary level" of the political system. This level refers to the emergence of successor states, such as Oudh and Bengal, following "the dissolution of Moghal power, if not authority"

Mansa Ram, the father of the first Raja of Banaras, was a Bhumihar Brahmin. He worked initially for the local *amil* (tax-collector) in Jaunpur district, and was later himself elevated to the office of *amil* at the court of Mir Rustam Ali, who administered the four districts of the Banaras province under Saadat Khan, Nawab Vazir of Oudh. Although Mansa Ram himself was one of four brothers whose father "controlled" a few hundred *bighas* in a village in Jaunpur district, at the death of Saadat Khan in 1739, he (Mansa Ram) "through lavish presents and the promise of paying to Safdar Jung (Saadat Khan's nephew and successor) an enhanced revenue, obtained a *sanad* for his son Balwant Singh which made the latter Raja of Banaras, Jaunpur and Mirzapur" (Cohn, 1962:314). The point to note is that in this particular situation, as contrasted with the case in Orissa and in Bundelkhand, there was no inherent descent-based legitimacy for the Raja of Banaras. Rights to territory in these other instances were intrinsically related to descent. Cohn shows how the legitimacy of Chait Singh, Balwant Singh's successor, was brought into question by the Nawab of Oudh. It could be restored only through the intervention of Warren Hastings. Furthermore, the secondary level authority, the Nawab of Oudh, was progressively constrained to bestow legitimacy on successors of this upstart family because the Raja, howsoever reluctant to paying up the full revenue, could be made to yield something. This was more than would have been possible under chaotic conditions created by rebellious zamindar were the Raja to be removed. It was, as Cohn aptly puts it, "the balancing of relative weakness" in the face of determined groundswell of resistance from the local zamindars which provided the cement for the system. Finally, we should note that the rights to land and its produce—whether of the local-level zamindars or of the Raja—are discussed in this context as aspects of "control". This is connected with the fact that the majority of Raja-level ('regional level') controllers of land were, like the Raja himself, tax-farmers (Cohn, 1969:62) rather than agirdars, holders of "estates of rights of administration" (Gluckman, 1965:42). In short, the particular regional circumstances of Banaras raj predispose Cohn to view the question of legitimacy in a political rather than in a status context just as it leads to emphasising "land control" at the expense of multi-layered rights in land and its produce.

In order to improve upon the static implications of the "little kingdom" and "block" conceptualisations of political systems in pre-British north India R G Fox (1971) has utilised a model of interaction between two major variables: unilineal descent-groups of the Rajputs and state-hinterland political relations in "pre-industrial" North India. Each is treated as an independent variable, however, some ambiguity arises on account of his employment of 'political' as an umbrella concept. The use of this concept to characterise the functions of a large number of intermidiary beneficiaries between the producers and the State is fairly unexceptionable. In this respect Fox's formulation is a variation on Cohn's "levels of political system". However, the system of Rajput descent-groups at the regional and local levels demands finer scrutiny than afforded by discerning its political functions alone.

Boundary Conditions

For at least three hundred years until its integration into the Indian Union in 1948, the Bundelkhand region formed the territory of Native States. On the basis of geo-political variation, it is possible to divide this region into four zones. (1) The *cis*-Jamuna Daob and the plateau tract. The British Districts of Jhansi, Jalaun, Hamirpur and Banda lay in this zone. (2) The plateau and ravines between the Chambal and Betwa Rivers. Among the Bundela kingdoms in this zone were Chanderi, Datia and Orchha. (3) The plateau and forest from River Betwa in the west to as far as the Bhanrar Ranges of the Vindhyas in the east and to River Narmada in the south. The Bundela kingdoms of Bijawar, Panna, Ajaigarh and Charkhari, and the Ponwar kingdom of Chhatarpur founded by a Ponwar Rajput retainer of Panna Raja in 1785 lay in this zone. (4) The *cis*-Narmada southern zone. It shares many of the physical characteristics of zone (3) but the river valley plains of the Narmada are more fertile than those innundated by River Ken. There is also a good proportion of black cotton soil. From the late 18th century this zone came under the direct administration of the Marathas and, later, of the British. In its political evolution, therefore, it is comparable to that of zone (1). The British Districts of Sagar, Damoh and Jubulpore lay here. The focus in this paper will be on zone (3) during the 'pre-British' period, though the term 'pre-British' does not have in these territories the unequivocal sense it possesses for areas directly under British administration.

The maximum extent of Bundela territory under the hegemony of a single ruler was the kingdom of Panna carved out by Chhatrasal. Before his death in 1734, Chhatrasal had bequeathed one third of his territory (Jhansi and Jalaun) to the Marathas, and the rest was divided amongst his heirs. Between the Treaty of Bessein in 1802 and 1886, almost all the Maratha share of his inheritance had passed under British control. This territory, known as British Bundelkhand in pre-Independence literature, was administered under the British district system and is of no direct concern to us here. However at the same time as the Maratha territories of Bundelkhand passed under British control, the Bundela territories also came under the purview of a British Political Officer who was attached to the forces operating in Bundelkhand for the purpose of introducing order into civil administration. This appointment was formalised in 1811, when the country was settled, as Agent to the Governor-General of India stationed at Banda (British Bundelkhand). In 1854 the Central India Agency was created in the interests of further rationalisation of political relations with the Native States. This process continued throughout the present century until the integration of these states into the Indian Union in 1948.

If we work our way back into the history of this region it will be seen that before the establishment of British paramountcy in the 18th century, the indigenous political systems of Bundelkhand had been articulated with two centralised politics—the Maratha and the Moghul. Writing about the Benaras region Bernard Cohn distinguishes four levels of political system in 18th century India—the Imperial (British or Moghul), the Secondary (the Nawabs of Oudh), the Regional (the Raja of Banaras) and the Local (Rajput lineages). During this period in Bundelkhand, it is possible to discern only two levels: the 'attenuated' Imperial (Moghul) and an osmosis between the regional and the local on account of the clan-based structure of indigenous polity.

Relations with Moghul Empire

Whether or not the kingdom of Orchha formed a part of Akbar's domain is contentious. It is known however, that Bundela chiefs of Orchha and Datia were under the suzerainty of Jahangir and the later Moghuls. Their status, however, was much more autonomous than that of jagirdars or even official mansabdars in the Daob. Their only obligation to the Emperor was the payment of tribute. Military support was expected but was frequently given with much reluctance. For the sake of their autonomy, at once social and political, the Bundela chiefs, unlike certain other chiefs of Rajputana, never consented to send their daughters to the imperial harem. On the other hand, they participated in the Moghul wars of succession much to their own advantage and, as war-leaders in an inhospitable tract, little known to the Moghul outsiders. Throughout this early phase, the imperial administration had formally provided a secondary level through the offices of subahdars and kiladars. But the imperial

officials were constantly under attack from the local chiefs.

Only towards the close of the first phase, which corresponds with the death of Chhatrasal, did a secondary level proper (equivalent to the Nawab of Oudh in Banaras) in the form of Bangash Nawabs of Farrukhabad appear on the Bundelkhand political scene. But its consolidation was delayed by the course of its initial failure. In 1729 the army of Muhamad Khan Bangash suffered a decisive defeat at Jaitpur from the joint forces of the Bundelas and the Marathas.

The available historical record of circumstances under which Chhatrasal obtained Maratha help in the battle of Jaitpur defies a cut and dried classification of Maratha authority in Bundelkhand into any one of the levels suggested by Cohn. The military administration of the Marathas was based on the principle of theocratic warfare. There is documentary evidence that the idiom of a military pact between the Peshwa Bajirao and Chhatrasal Bundela was that of common religion and 'kinship'. The kinship idiom recurs in the deed of inheritance by which Chhatrasal bequeathed one third of his territories to the Maratha Peshwa and in letters exchanged between their successors. Even the Treaty of Alliance between Peshwa Bajirao and Hirdeshah, Chhatrasal's son and successor, is essentially similar to those which used to be signed between two Bundela chiefs. Consequent upon their gaining a territorial foothold in Bundelkhand, the Marathas entered into similar Treaties of Alliance with the other Bundela kingdoms of the area. Through the office of the subahdar in Bundelkhand the Marathas established representative rule in territories bequeathed to them by Chhatrasal. These were interspersed throughout Bundelkhand although most of them lay in zones (1) and (4). The transfer of territories from the successors of Chhatrasal to the Marathas in the remaining areas was however by no means a smooth process, although the correspondence between the Peshwa and the sons of Chhatrasal, Hirdeshah, the Raja of Panna and Jagatraj, the Raja of Jaitpur continued to acknowledge a sentiment of brotherhood.

It was not until a war of succession broke out among the descendants of Hirdeshah that a secondary level proper became the main external arena in the political conflicts of local Bundela rajas. The complicated pattern of political alliances between local chiefs with Marathas on the one hand and the Muslim Nawabs on the other hand is the theme of the history of Bundelkhand for nearly twenty years following the death of Chhatrasal in 1731. The entire Rajput held area of Bundelkhand in zone (3) had by this time became fragmented into numerous petty chiefdoms. The grant of hereditary jagirs and offices to Bundela and non-Bundela incumbents, the majority of whom were held together by little more than their common sentiment of kinship to the Panna raj under Chhatrasal, provided the first cause of this fragmentation. The second cause was the intrusion, again, of kinship as an ancillary principle of legitimisation of authority at the secondary level of the political system, the Marathas and the Nawab of Banda. Finally, the political systems of eastern Bundelkhand at this time became truly threatened, not only by the disappearance of the nominal authority of an attenuated Imperial level but also because the secondary levels were, as just noted, tied up vertically with the local and regional levels through the fiction of kinship.

After the Treaty of Bessain between the Marathas and the East India Company in 1802, foundations were laid of a political system which was to last for the next 150 years. The British dispensation in Bundelkhand rested on the military subjugation of the Marathas and the Nawab and the legal restoration of segmentary state structure among the Rajput chiefs. In the changed political and economic setting what could no longer be achieved by kinship and custom was effected by legal provisions, especially by the paramount control of civil law pertaining to land ownership. The definition of social dominance was bound to have serious repercussions on the structure of agrarian class relations.

Rights in Land and Status Framework

On the basis of genealogical and legendary information backed up by observations made in the course of field-work, I concluded in an earlier study (Jain, 1975) that the Bundelas' quest of territory for kingdom-formation was validated in a framework of unilineal descent. The evidence also suggested that the actual process of kingdom-formation was not characterised by emulation of the standards of a higher caste-group but that "under certain geopolitical conditions throughout middle India exclusion from a confirmed jati status was the means of gaining power and creating a new framework of statuses and offices" (*Ibid*, p 270).

The dynastic and dominance levels of the Bundela genealogy, like the legendary and mythical levels, form integral parts of a hierarchical series of encapsulated history. Using the genealogy as an aid to the study of past at these levels, one finds legends legitimising the rule of the Bundela over territory. The intervention of a charismatic holy man, the occurrence of a test of prowess for the king, and his disappearance rather than death are recurrent themes in foundation stories of Bundela kingdoms. It is strikingly obvious that here we have examples of legitimisation of royal authority by founders of sects rather than by Brahman priests. The Hindu kingdoms of Bundelkhand provide a context in which the Brahman's influence was not so strong as in those regions squarely under Muslim domination (Dumont, 1970:155). It is not so surprising, therefore, that the ritual hierarchy of castes is unable to yield the principle of legitimisation of power into authority in Bundela kingdoms. Nor is this true of Bundelkhand alone. Mayer mentions that in the territory of the former princely state of Dewas Senior in Malwa, Gokulashtami, the main ritual of the year was "not priest-ridden but ruler-ridden" (Mayer, 1958:420).

On the more substantive aspects of land rights in Zone (3), there is paucity of historical data and, as yet, of search and systematic analysis of pargana-level records comparable to the work done by historians, for example, in eastern Rajasthan (Chandra and Gupta, 1966). In default of such research, however, I would like to offer the case study of the kingdom of Panna in Bundelkhand zone (3) to ask some anthropological questions of the extent data and to offer a few suggestions concerning the fruitfulness of a combined anthropological and historical attack on these questions. In this preliminary exploration, let us bear in mind the social, cultural and political features of 'pre-British' indigenous kingdoms in this area already delineated: (1) descent-based rule, (2) procedures for the legitimisation of power into authority not subsumed by a 'caste' model; and (3) relatively loose political integration with centralised 'paramount' polities.

Maharaja Chhatrasal

Chhatrasal (1649-1731) was the founder of the kingdom of Panna. His career is relatively well-documented (Gupta, 1958, Singh, 1973; 1975). From a sociological point of view it is an interesting case for re-constructing the pattern of claims to rights in territory and the significance of kinship as a status factor in political transactions.

Chhatrasal's patrilineal ancestor in the sixth ascending generation belonged to a cadet-line of the ruling house of Orchha. A grant of the year 1612 enumerates the 13½ villages by revenue units (pargana) and subunits (mauja) to whose income Chhatrasal's paternal grandfather was entitled in perpetuity (7). The income from this estate was granted to the holder as remuneration for service and administration. The grantee is referred to as 'brother'

(bhaiyya). The title of Chhatrasal's father Champat Rai was 'Rao', held in Bundela kingdoms by holders of estates of rights of administration in the cadet lines. Champat Rai, like his forefathers, lived in village Mahewa which remained the military capital of Chhatrasal throughout his life.

It is clear that Chhatrasal's quest for a kingdom (a territorial domain as contrasted with plunder) was motivated by a desire to establish a princely lineage and founding a royal house. The question of male progeny is inextricably bound up with the founding and perpetuation of a royal lineage. The right of a Bundela jagirdar to concerted effort for acquiring a kingdom is conceptualised as *bhum* (literally, land or territory). The tendency in literature dealing with this right in the former Rajputana states has been to define it in terms of a tenure by birthright (clanship) and to contrast it with tenures granted by the ruler According to Thorner (basing himself on Tod), the *bhum* tenure was highly coveted as the king could not interfere with it; indeed the king himself would crave for retaining *bhum* rights in a few villages. Our data from pre-British Bundelkhand suggests a more dynamic interpretation of this 'right' or 'tenure'. It should be referred back to a time when the Rajput kingdoms were still proliferating by segmentation from the prior royal lineages; that is, when a "frontier" for expansion existed. In this context, the right of the *bhumia* (holders, both Rajput and non-Rajput) consisted not only in confirmed possession of the lineage territory but also (in the case of the Rajputs) in carrying out warfare, raid and plunder (*bhumiawat*) to extend their territorial possessions, with the purpose of establishing royal authority over them.

Chhatrasal's policy of expansion and consolidation of his rule was two-pronged. On the one hand, he was related to the ruling Bundela houses of Orchha, Datia and Chanderi by ties of descent-based rule. As a descendant in one of the cadet lines of Orchha he held rights of *jagirdar* in Mau-Mahewa and cognate villages. The village of Mau-Mahewa remained his military capital, from where he carried out raids for acquiring territorial and other possessions to form a kingdom. The latter task was accomplished in 1675 with the capture of Panna. However, throughout his life he also engaged in predatory warfare against regional representatives of the central authority of the Moghuls. These campaigns conform to the narrow and technical notion of *bhumiawat*. The code of conduct between Bundela ruling houses forbade attacking each other's territory, but *bhumiawat* in other territories, especially those under the administrative and military control of alien chiefs and appointees of the central government, was a matter of redeeming one's honour. Unless we take into account both the processes of consolidating the rule in Panna raj and carrying out raids in outlying territories, it is not possible to grasp the exact significance of a local saying about the 'territorial limits' of Chhatrasal's prowess:

> *it Jamuna ut Narmada, it Chambal ut Tons, Chhatrasal so laran ki, rahi na kahu hons*
>
> From Jamuna in the North to Narmada in the South; from Chambal in the West to Tons in the East; no one (within these limits) has the courage to fight Chhatrasal.

If we were to abide by a conception of 'stratified lineages' such as Richard Fox advocates for dominant Rajput groups in *19th century Uttar Pradesh*, Chhatrasal should have been subordinate to the ruling houses of Orchha, Datia and Chanderi as belonging to a cadet lineage. To be sure, Chhatrasal started his career in that position but gradually built himself up as a *primus inter pares* with his "brothers", the rulers of Bundela kingdoms which preceded Panna. A treaty with Orchha, Datia and Chanderi kingdoms (April 25, 1721) addresses Chhatrasal as 'Maharaja, along with the two other Bundela rulers—those of Chanderi and Orchha—while the ruler of Datia, belonging as he did to the Gujar caste, enjoys only the title of 'Rao'. Another indication of Chhatrasal's equality of status with rulers of other Bundela kingdoms is furnished by the fact that he relinquished the paternal jagir held from Orchha. The significance of this act is explained by Chhatrasal in a letter addressed to the State officials of Panna (November 11, 1730): "My honourable father Rao Champatrai was a jagir-holder in Orchha and I desire it to be returned to them (those of Orchha *orchhewalan*). When I have obtained and won territory by my own prowess, why should I retain the name of a jagir-holder? Why should we remain their subordinates? Quite gladly should that jagir along with the instrument be handed back to those of Orchha. Let there be no contention with them (about it) for the past or in the future. Since we descended from those of Orchha we had a right (huq), but we are not beholden to them for any favours...."

A number of letters written by Chhatrasal and to him furnish a full picture of the manner in which he settled within his lifetime estates in rights of administration among his principal sons, subsidiary sons, other relatives, and to those who served him in warfare. In this correspondence the extent of territory included in the kingdom of Panna is expressed in two ways; firstly by the number of parganas (there were 40 of them), and secondly, according to the territory's annual income. By this reckoning the kingdom of Chhatrasal has been estimated to have yielded Rs 1,53,000,00 per annum. While this amount represented the income from land revenue, other sources of income were the diamond mines of Panna, levying of *chouth*, and yield from plunder. The royal treasuries at Panna, Mahewa and Jaitpur are estimated to have held Rs 5,00,000,00. Besides this there was a separate amount of Rs 8,00,000,00 whose existence was revealed by Chhatrasal to his son and successor Hirdeshah shortly before his death. And all this treasure excluded the gold, silver, and ornaments which had been obtained in plunder and deposited in royal treasury.

Chhatrasal bequeathed the major portion of his kingdom to his principal sons. The relative status of these sons (four of these, Hirdeshah, Jagatraj, Padmasingh and Bharatichand, are recorded in history) was reckoned not by the order of birth, but by the status of their mothers as senior or junior queens of the ruler. Thus Hirdeshah, though younger in age to Padmasingh and Jagatraj was nominated heir apparent to the seat of Panna because his mother Devkunwar of the Panwar clan was Chhatrasal's senior queen. Besides Panna, he was granted Kalinjar and Shahgarh also. His territories yielded annual revenue of Rs 38 lakhs. Jagatraj's mother, on grounds of her son being older than Hirdeshah, made every effort to obtain for him succession to the throne of Panna. But she could not move Chhatrasal into flouting Bundela custom, and Jagatraj had to rest content with territories in Jaitpur, Ajaigarh and Charkhari, yielding annual revenue of Rs 33 lakhs. As to his eldest son, Padmasingh, also born of a junior queen, Chhatrasal had as early as 1689, granted the pargana of Jigni, the seat of Jigni town, the title 'Rao', and royal paraphernalia consisting of jewellery, caparisoned elephant, carpets, etc. The estate yielded annual revenue of Rs 3½ lakhs. A fourth son, Bharatichand was similarly settled with his share in the kingdom worth Rs 2 lakhs per annum within Chhatrasal's lifetime. Besides granting estates of rights in administration to his principal sons, Chhatrasal granted two *parganas* (Jalalpur and Darsainda) with an annual income of Rs 6 lakhs to his daughter-in-law Jaikunwar, (wife of Jagatraj), for her bravery in the battlefield against Muhamad Khan Bangash.

The dispensation listed above would account for a little more than half of the total estates claimed to be under Chhatrasal's possession. Although he had promised to hand over a third of his kingdom to the Maratha Peshwa Baji Rao, he did not alienate any of his estates to him within his lifetime. In fact in a letter

to Hirdeshah (No 39) Chhatrasal confided to his heir apparent the fact that the Peshwa had been told that the kingdom was worth Rs 1 crore only. In the same letter Hirdeshah was advised not to part with the promised share to the Peshwa but try and meet his demand with money payment only.

In sum, then, Chhatrasal created estates of rights in administration for his principal sons, subsidiary sons, other relatives and for those who had assisted him in warfare. The sons and other relatives were known as jagirdars while holders of service tenures were known as maimardars. Besides these estate-holders who were bound to the ruler by set duties, there were recipients of benefices in religious charities who were not called upon to perform martial duties. The jagirdars, being by and large the ruler's relatives, had to provide only a specific number of infantry and cavalry when commanded to do so; the maimardars had to pay, in addition, an annual quit-rent. This was one sign of their inferior status *vis-a-vis* jagirdars. The ruler's principal sons enjoyed a highly privileged status, and in Chhatrasal's own lifetime Hirdeshah and Jagatraj operated very much as rulers of Panna and Jaitpur respectively, with Chhatrasal preferring to stay in his military capital of Mau-Mahewa. However, there was a built-in check to the ambition and expansionist designs of the sons, in the form of relatives and non-relatives of the rulers who were simultaneously jagirdars and sardars, office-holders in the state bureaucracy. It should not be forgotten that the territories made over into 'estates of rights of administration' to the various categories of sons, other relatives, maimars and sardars excluded those which were administered directly by the ruler. These were known by the Moghul term 'Khalsa'.

In so far as the above estates of rights of administration were allocated, by and large, on the basis of kinship and recognition of services in warfare, a generalised sentiment of 'brotherhood' formed the "moral and tactical" (Bloch, 1971) bonds uniting the holder to the ruler and to one another within a regional political system. These rights were hereditary and upto the pargana level each territorial block was subject to a series of retreating or reversionary rights from the holder upto the king. However, the analogy with property rights in Zululand breaks down at the village level. Looked at from the point of view of the kingdom polity, a village as a whole formed an 'estate of production'. Our data for the village-level in pre-British Bundelkhand is very scanty, and an answer to the question as to who were the holders of the 'estate of production' is, therefore, both varied and difficult. Chhatrasal, as the king of Panna, had dealings with at least two categories of local landholders. Firstly there were those patels, zamindars, tahsildars, umeers, and soobahdars who controlled land revenue in territories which comprised Chhatrasal's area of raiding rather than direct rule. As noted earlier, this area was covered by what may be called Chhatrasal's campaign of bhumiawat. The various title-holders and officials included in this category owed their allegiance to the imperial Moghul power. Chhatrasal's policy with regard to these controllers of land seems to have been to levy the chouth and to demand ransom By these means, the Bundela bhumiawati was able to secure not only a booty but was also able to assert his political authority over and above the heads of imperial appointees. Failure to comply with the demand for chouth brought wanton pillage and destruction of standing crops in retribution—acts which would at one stroke instil terror in the hearts of the holders of estates of production and also hit the imperial authority in its most sensitive spot, its revenue-base. "Chhatraprakasa", the poetical biography of Chhatrasal, is full of instances where such tactics were pursued.

There were, on the other hand, estates of production directly under the rule of Chhatrasal administered either through his own officials or through holders of estates of rights of administration or corporate bodies of kinsmen claiming ownership of one or several villages. The latter could belong to any caste, and would be known either as bhumiya or zamindar. They would lease their lands to tenants, or have them cultivated by agricultural labourers, or they would cultivate some of the lands with their own family labour, or they would adopt a combination of any of these possibilities. In any case, a distinction seems to have existed between these village-level holders of estates of production and their super-ordinates, the holders of estates of rights of administration. The latter lived in forts and towns, the former in the villages. More importantly, from the latter's point of view, the gradations of agrarian statuses (landlord, tenant, sub-tenant, etc) within the village were subsumed by the important fact that the village was the unit on which developed the obligation of paying up the revenue—either through the title of the headman or through representatives of zamindars or bhumiyas. This remained true even when land came into the market (of bhej-barar tenure in Banda district). It is in this precise sense that we may understand both the relationship and the separation of the "two worlds" of the state and the village.

JAWAHARLAL NEHRU UNIVERSITY

NEW DELHI

Announcement for Admissions, Academic Session 1979-80

Applications are invited for admission to the programmes of study and research leading to the award of M.A., M.Sc., M.C.H., M.Phil./Ph.D. degrees and Pre-Degree Diploma, Advanced Diploma in Mass Media, Advanced Diploma of Proficiency, Diploma of Proficiency and Certificate of Proficiency in various disciplines/languages as indicated under each School of Study:—

A. **Schools and Programmes of Study:**

I. **School of International Studies: Programmes of Study:** (i) **M.Phil./Ph.D.:** Course work and research facilities are available in the following areas:— International Politics (including Political Geography); International Organization; International Trade & Development; Disarmament Studies; International Legal Studies; Diplomatic Studies; South Asian Studies; South-East Asian Studies; Central Asian Studies; Chinese Studies; Japanese and Korean Studies; West Asian and North African Studies, Sub-Saharan African Studies; American Studies; Latin American Studies; West European Studies and Soviet and East European Studies. (ii) **M.A.:** (Two-year) in Politics (International Studies).

II. **School of Languages: Programmes of Study:** (i) **Ph.D.:** in German, Persian, Russian, Spanish and Philosophy (Modern Western Philosophy only). (ii) **M.Phil./Ph.D.:** in French, Hindi and Urdu. (iii) **M.A. (Five-Year Integrated Programme):** in French, German, Russian, Chinese and Spanish (with entry points in First, Second and Fourth years); Japanese (with entry points in Second and Fourth years). **M.A. (Two-year):** in Arabic, Persian, Hindi and Urdu. (iv) **Pre-Degree Diploma:** (One-year Intensive course) in Bahasa Indonesia, Uzbek and Korean. **Part-time Programmes (One-year):** (v) **Advanced Diploma in Mass Media in Urdu.** (vi) **Advanced Diploma of Proficiency in French.** (vii) **Diploma of Proficiency:** in Arabic, English, French, German, Chinese, Italian, Persian, Portuguese, Russian and Spanish. (viii) **Certificate of Proficiency:** in Arabic, English, French, Functional French, German, German (Scientific Work), Italian, Persian, Portuguese, Russian, Spanish, Sinhalese and Urdu.

III. **School of Life Sciences: Programmes of Study:** (i) **M.Phil./Ph.D. programme:** Course work and research facilities are available in the following areas:— Adaptive Biology, Biophysics, Cancer Biology, Developmental Biology, Membrane Biology, Metabolism, Microbiology, Molecular Biology and Genetics, Neurobiology, Plant Physiology and Photobiology, Physiology, Biology of Neuromuscular System and Radiation Biology. *(ii)* **M.Sc. (Two-year) programme in Life Sciences:** is open to candidates both with Biology and Non-Biology backgrounds. Provision has been made for some remedial courses to enable students from other than Biology background to make up their deficiencies. (This being an inter-disciplinary two-year intensive programme leading to the award of M.Sc. degree in Life Sciences, no separate degrees in Physics, Zoology, Botany and Chemistry would be awarded).

IV **School of Social Sciences: Programmes of Study:** (i) **M. Phil./Ph.D.:** The curricular and research work is organised through a number of inter-disciplinary Centres, with focus on some major problems of study. Candidates will be admitted to the following Centres: (1) Historical Studies; (2) Political Studies; (3) Regional Development; (4) Social Systems; (5) Educational Studies; (6) Economic Studies and (7) Social Medicine & Community Health. Planning (Ph.D. only); and (ii) **Master of Community Health (M.C.H.):** (3-semester programme inclusive of vacations). The programme is primarily meant for social scientists and nurses working in the field of Community Health. The Programme consists of course work and field work. (iii) **M.A. (Two-year):** in Economics, Geography, History, Political Science and Sociology.

V. **School of Environmental Sciences: Programme of Study: M.Phil./Ph.D.:** The programmes of the School are inter-disciplinary in nature. The School endeavours to study the problems of environment in an integrated manner using the concepts and techniques of the Biological, Geological and Physical Sciences. Course work and research facilities are available in the following areas:— **Research Area I** Mathematical Ecology, Mathematical Biosciences, Dynamic Meteorology, Bioelectronics. **Research Area II** Geochemistry, Mineralogy, Resource Geology, Oceanography, Geomorphology, Sediments and Sedimentary Processes, Water Pollution, Lithology. **Research Area III** Environmental Management and Monitoring, Water Pollution, Air Pollution, Chemistry, Soil Pollution and Solid Waste Management, Environmental Organisation, Systems Law etc. **Research Area IV** Ecosystem Energetics, Environmental Physiology and Environmental Health, Radiation & Molecular Biophysics, Environmental Biochemistry, Biological Nitrogen Fixation, Pollution Ecology, Ecological Planning, Plant and Animal Ecology, Genetic Engineering.

VI. **School of Computer and Systems Sciences: Programme** of **Study: M.Phil./Ph.D. in Computer Science:** The School's programmes prepare the students with background in information processing suitable for further studies in Computer Science including theoretical foundations of Computer Science, programming Languages and Systems, Computer Applications, Systems Engineering etc. A limited number of candidates having brilliant academic record together with some research/work experience may be considered by the School for direct admission to Ph.D. programme.

B. **Eligibility for Admission:** (i) **(a) M.Phil./Ph.D. programme in School of International Studies, School of Languages and School of Social Sciences:** A good Master's degree with at least 50% marks in the concerned or related discipline or a corresponding Letter Grade or Cumulative Grade Point Average (CGPA) in the letter grading system besides good academic background and aptitude for research. Candidates for the M.Phil./Ph.D. programme in International Trade and Development in the School of International Studies must have a good Master's degree in Economics with at least 50% marks or a good B.A. (Hons) degree in Economics with M.A. in a related discipline with at least 50% marks. They must also have familiarity with college level Mathematics. **(b) M.Phil./Ph.D. programme in School of Life Sciences, School of Environmental Sciences and School of Computer & Systems Sciences.** A good M.Sc. degree in the concerned or related discipline with at least 55% marks (a good Bachelor's degree in Engineering or a good Master's degree in relevant science areas with at least 55% marks for M Phil. in Computer Science) or a corresponding Letter Grade or Cumulative Grade Point Average (CGPA) in the letter grading system besides good academic background and aptitude for research. (c) Candidates with Bachelor's degree in Engineering/Technology and M.B.B.S. degree could also be considered for admission in the Centre for Social Medicine and Community Health in the School of Social Sciences. They are also eligible for admission to the M.Phil./Ph.D programme in the School of Environmental Sciences. (d) Similarly candidates with LL.B. degree (Three-year course) with at least 50% marks or a corresponding letter grade or Cumulative Grade

Continued

Point Average in the Letter Grading system, after B.A. with Political Science are eligible for admission to the M.Phil./Ph.D. programme in International Legal Studies Division only of the School of International Studies. (ii) **M.C.H.: (a) Social Science Stream:** A good Master's degree with at least 50% marks or a corresponding Letter Grade or Cumulative Grade Point Average in letter grading system in Sociology, Psychology, Anthropology with good academic background and interest in Community Health. (b) **Nursing Stream:** Same requirements as in (a) above except the degree has to be M.Sc. in Nursing. (iii) **M.Sc. (Two-year programme):** A Bachelor's degree with at least 55% marks or corresponding Letter Grade or Cumulative Grade Point Average in the letter grading system in any combination of natural sciences (Physics, Chemistry, Zoology, Botany, Physiology, Geology, Mathematics, Anthropology, Agriculture, Medicine and Engineering). (iv) **M.A.—Two-year programme and the IVth Year of the Five-Year Integrated Programme leading to the Master's degree:** A Bachelor's degree in the related discipline with at least 50% marks or a corresponding Letter Grade or Cumulative Grade Point Average in the letter grading system. (v) **M.A. Second Year (Third Semester) of the Five-Year Integrated Programme:** Intermediate or an equivalent examination with at least 45% marks or a corresponding letter grade or cumulative grade point average in the letter grading system with good proficiency in the language concerned. (vi) **M.A. First Year of the Five-Year Integrated Programme:** Higher Secondary/Pre-University/Indian School Certificate or an examination recognised as equivalent thereto, with at least 45% marks or a corresponding Letter Grade or Cumulative Grade Point Average in the letter grading system. **Minimum age: 16 years as on 1st of October, 1979.** (vii) **Advanced Diploma in Mass Media in Urdu:** A Bachelor's degree or an examination recognised by the University as its equivalent with Proficiency in Urdu equivalent to that of B.A. standard. **Minimum age: 18 years as on 1st of October, 1979.** (viii) **Pre-Degree Diploma:** Higher Secondary or equivalent qualification with at least 45% marks or a corresponding Letter Grade or Cumulative Grade Point Average in letter grading system. **Minimum age: 16 years as on 1st of October, 1979.** (ix) **Advanced Diploma of Proficiency in French:** Higher Secondary or equivalent qualification and Diploma of Proficiency in French or an examination recognised as equivalent thereto. (x) **Diploma of Proficiency:** Higher Secondary or equivalent qualification and Certificate of Proficiency in the language concerned or an examination recognised as equivalent thereto. (xi) **Certificate of Proficiency:** Higher Secondary for an equivalent qualification. (xii) **Certificate of Proficiency in German (Scientific Work):** Higher Secondary or an equivalent qualification with some background of Natural Sciences.

C. General (i) **Fellowships/Scholarships:** A limited number of University fellowships of Rs. 400/- Rs. 500/- p.m. with prescribed contingency grant are available to deserving students admitted to the M.C.H. and M.Phil./Ph.D. programmes of study. As per UGC rules only those students who have secured a minimum of 55% marks in M.A./M.Sc. or have secured a B+ letter grade or equivalent Cumulative Grade Point Average are eligible to apply for Junior Fellowships. Besides this all States of Indian Union (except Himachal Pradesh, Meghalaya, Manipur, Mizoram and Sikkim) have instituted one or two scholarships of Rs. 300/- Rs. 400/- Rs. 500/- p.m. each with or without contingency grant for students having domicile in the respective states, admitted to the M.Phil./Ph.D. Programmes in the School of International Studies. The Reserve Bank of India has also instituted one fellowship of Rs. 400/- Rs. 500/- p.m. with contingency grant for those specialising in International Economics. A limited number of Merit-cum-Means Scholarships of the value of Rs. 100/125/- p.m. and Rs. 75/110 p.m. are available for award on merit-cum-means basis to needy and deserving students admitted to the Master's and the Pre-Degree programmes respectively. (ii) **Field Work:** The University facilitates (subject to the availability of funds and foreign exchange) field work by students in India and abroad in case the nature of the project or non-availability of adequate source material necessitates on-the-spot study and investigation. (iii) **Reservation of Seats for SC/ST candidates:** Upto twenty per cent of seats are reserved for candidates belonging to Scheduled Castes/Tribes in each programme of Study/Centre. In addition adequate weightage is given to candidates belonging to backward areas/weaker sections of society, first generation learners and to those employed candidates who are sponsored by their employing organisations. **The minimum academic standards are relaxable in the case of these categories of candidates** and/or where response from eligible students is not adequate. (iv) **Reservation of seats for Handicapped Students:** 3% of the seats are reserved for the physically handicapped students in various programmes of study provided the candidates seeking admission fulfil the prescribed conditions laid down for the purpose. Candidates are required to submit a Medical Certificate in support of their physical handicap. (v) **Travel Concession:** The University endeavours to attract students from all over the country. With this objective in view all outstation candidates called for interview/test for admission to Post-graduate courses viz. M.A./M.Sc., M.C.H., M.Phil./Ph.D. will be paid TA for the distance over and above 300 kms. @second class railway fare both ways. **The fare for the first 300 kms. each way shall be borne by the candidates themselves.** (vi) **Hostel facilities:** Hostel accommodation is primarily meant for students coming from outside Delhi. In view of the limited hostel facilities available, however, candidates may please note that grant of admission to a programme of Study in the University would not automatically entitle one, for allotment of hostel accommodation. 20% of the seats in the University Hostels are reserved for candidates belonging to Scheduled Castes/ Scheduled Tribes.

D. How to Apply: Application forms, together with the detailed instructions, can be had either by calling at the Office of the Administrative Officer of the School concerned on the JNU's Campus at New Mehrauli Road on payment of Re. 1/- in cash (for one set of application forms) or by sending a self-addressed stamped (Rs. 3.25) envelope of 28 × 13 cms. in size **together with** Crossed Indian Postal Order of Re 1/- (for one set of application forms) drawn in favour of **the Finance Officer, Jawaharlal Nehru University, New Delhi to the Administrative Officer, of the School concerned (specify the School),** Jawaharlal Nehru University, New Mehrauli Road, New Delhi-110 067 and should be mailed **(in duplicate)** so as to reach him on or before **7th July, 1979.**

Note: (1) **Candidates wishing to apply for admission to more than one discipline/Language should send separate application forms (in duplicate) for each such discipline or language concerned.** (2) Candidates who have appeared in the respective qualifying examinations this year and whose result is not likely to be declared by the closing date may also apply for admission provisionally subject to their securing the requisite percentage of marks. They should submit a certificate from the Principal of the College last attended certifying that the candidate has appeared in the qualifying examination in 1979 and thereafter submit Certificate/Marks-sheet of the qualifying Examination latest by January 7, 1980 failing which admission will automatically stand cancelled. Applications of candidates who have not appeared at the qualifying examination will be **Summarily rejected.** (3) Candidates may please note that fulfilment of minimum eligibility conditions would not entitle him/her to be called for test/interview. In view of the limited number of seats in each programme the number of candidates to be called for test/interview will be decided by the respective Schools/Centres depending upon the number of applications received for each programme.

Masterpieces inspired by Indian Dyes

MADHUBANI

Paintings in the characteristic Madhubani style are today much sought after all over the world Loose-limbed exaggeratedly vertical figures almost naively drawn but nevertheless with a reserve of strength in their forms dominate the compositions Foliage and flower are stylized and elaborated into extended decorative patterns

In Madhuban and its neighbouring villages in the southeast of India this style of painting was used traditionally for murals on the outside of huts Today the designs are being adapted on fabric and paper

The Madhubani murals were executed only by women who obtained all the colours used from natural sources Sensuous scarlet and deep sienna from the Kusum blossom bright yellow from turmeric soft gold from a compound of banana leaf juice milk and lime, rich black from encaptured smoke these were then mixed with goat s milk and Bakul tree gum as binding media

Indian dyes have come a long way since then

Today Atul Products produces a wide range of Synthetic Dyes which help colour everything from fabrics of cotton jute wool art silk and man made fibre, to leather and paper

Atul also produces Dye Intermediates to help make Synthetic Dyes, and Optical Whitening Agents which make whites look whiter

Wherever there is colour, there is a dye Atul makes some of the finest man-made dyes

ATUL® India's giant chemical complex

More Uneven Growth

ONE of the well known features of the so-called green revolution in wheat was [illegible] the increase in production had been concentrated in Punjab, Haryana and western UP. It has, therefore, been an important objective of government policy in the field of agricultural development to correct this unevenness and achieve a more even geographical spread of increases in production and productivity However, this objective appears to have completely eluded the government. In fact, the experience with regard to wheat has been repeated in rice as well. There has been a notable rise in the production of rice in the last few years, but this has been as concentrated geographically as the earlier increase in wheat production and, what is more, has been concentrated in the very states which have accounted for the bulk of the increase in wheat production This is all the more remarkable because whereas these states were major wheat producers even to begin with, production of rice is a more or less new activity for them, especially for Punjab and Haryana.

According to the report of the Agricultural Prices Commission on price policy for kharif cereals for the 1979-80 season, all India production of rice increased by 7 mn tonnes, or 17 per cent, from an average of 40.8 mn tonnes in the triennium ending 1970-71 to 47 8 mn tonnes in that ending 1977-78. Of the additional production of 7 mn tonnes, as much as 3 mn tonnes, or 42 per cent, was accounted for by Punjab, Haryana and UP. As a result, the share of these three states in total production of rice in the country went up from 10 6 per cent to 15 4 per cent. By contrast, the country's principal rice producing states of Andhra Pradesh, Bihar, Orissa, Tamil Nadu and West Bengal, which between them accounted for 60 per cent of the total production of rice in the triennium ending 1970-71, contributed only 2 1 mn tonnes to the rise in output of rice Production of rice went up by 250 per cent and 120 per cent in Punjab and Haryana, respectively, while in UP there was a rise of 35 per cent On the other hand, except Andhra Pradesh which registered a rise of 20 6 per cent, the increase in production achieved by the other principal rice-growing states was well below the all-India average of 17 per cent, with Orissa registering a sizeable decline in production

Both expansion of area and increase in yield have contributed to the sharp rise in rice production in Punjab, Haryana and UP. The all-India yield of rice went up from 1,091 kgs per hectare in the triennium ending 1970-71 to 1,215 kgs in that ending 1977-78, or by 11 4 per cent However, the rise in yield in Punjab was 87 per cent, in Haryana 60 per cent and in UP 30 per cent. During the triennium ending 1977-78, Punjab achieved a yield level of 2,886 kgs per hectare and Haryana of 2,392 kgs, compared to yields of 1,515 kgs in Andhra Pradesh, 936 kgs in Bihar, 896 kgs in Orissa, 2038 kgs in Tamil Nadu and 1,267 kgs in West Bengal In UP, it is true, the yield was still low at 973 kgs but this no doubt reflected the wide disparities within the state and certainly was not representative of the yields achieved in the western districts of the state which have been responsible for the rise in output of rice in the state

One obvious consequence of the concentration of the rise in production of rice in Punjab, Haryana and UP is that the government's task of supporting the price of rice has been made more onerous Thus, as in the case of wheat, price support purchases of rice by government agencies have mounted, from 4 4 mn tonnes in the 1976-77 rice marketing season to 4 8 mn tonnes in 1977-78 and further to 5 7 mn tonnes in 1978-79 (till the beginning of May 1979). The contribution of the above three states to these purchases was 65 per cent in 1976-77, 72 per cent in 1977-78 and 75 per cent in 1978-79. As much as 78 per cent of Punjab's rice output was sold to government purchasing agencies in 1977-78 and in the case of Haryana the proportion was even higher at 91 per cent As a result, stocks of rice with the government went up from 6 2 mn tonnes at the end of March 1977 to 9 8 mn tonnes at the end of March 1979 The proportion of rice in the total stocks of foodgrains with the government rose from 35 per cent to 61 per cent between March 1977 and March 1979.

Police

Stick and Some Carrot

FOR over a month now, the police, mainly though not entirely comprising the lower ranks of the force, have been astir in almost all the states and union territories. A not-so-strange paradox characterises the world of Indian policemen. Themselves among the lowest paid of government employees, the majority of the nine lakh policemen in India can be described as forming part of the toiling section of the Indian masses. Nevertheless, it is the policeman, particularly, the lowly constable, who is the most visible symbol of State power all over the country. Miserably abused, poorly paid, subjected to humiliating living and working conditions, being forced to be a virtual bonded labourer to his superiors under the infamous 'orderly' system, the average police constable is also the most effective instrument of suppression of mass movements, strikes, popular struggles, etc. The police, or sections of them, might now be protesting against 'political interference'; but the policemen are themselves willing tools of 'political' manipulation, allowing themselves to be suborned to serve the interests of the rulers, manufacturing false cases against those who challenge the present economic and social dispensation or even helping in their physical elimination.

Official response to the gathering storm of police agitations can only be described as panicky; both the concessions made and the steps taken to suppress the agitation have been of the extreme kind. In Punjab, along with a Rs 100 pay rise at the minimum and many other concessions by way of encashment of leave, increase in various kinds of allowances, etc, there have also been summary dismissals of a large number of policemen, arrests under preventive detention regulations, as also 'trials' within jail premises. At the first sign of disaffection among its police ranks, the Orissa government went so far as to declare that all the sub-inspectors of police in Orissa would from now onwards be 'gazetted officers'. On the whole, however, it is the stick and not the carrot that has finally predominated.

The seven-point plan of action evolved by the state chief ministers to improve the service conditions and emoluments of policemen is a similarly confused mixture of surrender and truculence and does not even touch the basic problem. The first of the seven points recognises that "policemen should be permitted to form associations", but this is immediately followed by the proviso—"subject to certain restrictions specified by the National Police Commission in its interim report". The same kind of 'yes, but' approach characterises other items of the 'plan of action'. The most significant part of this agreed 'plan of action' is perhaps the last item: "The chief ministers also agreed to initiate steps to check any political interference in the police administration".

Of the many types of political interference in the police administration which are rampant, what is it that is proposed to be checked? From the point of view of social justice for the masses of the people, what hurts most is the blatant partisanship of the police in support of the rich and the powerful. This makes it possible for the rich landlord or the upper caste Hindu to commit the most heinous crime against the landless worker and poor peasant or the scheduled castes without fear of let or hindrance from the police forces and, quite often, even with their active assistance and support. This is not generally even recognised as political interference with the functioning of the police; this is in fact the political role of the police. There can be no question of any change in this role so long as the political and economic system remains what it is.

A more accepted understanding of "political interference" is the use of the police by ruling class political parties and politicians in the power struggles among themselves. As these power struggles have intensified, such use of the police has become increasingly the rule, culminating in the state of Emergency of 1975 under which one faction of the Congress party mobilised the police (together with the rest of the State machinery) to put down all other factions and parties. Despite the supposed restoration of democracy in 1977, it cannot be truthfully said that this genre of political interference in the police has become less marked; only the interference now takes place on behalf of different parties, factions and politicians in different parts of the country. This is altogether understandable since the struggle for power among these have become progressively more intense. Given this situation, any number of plans politely agreed to in New Delhi will not result in reducing this type of "political interference in the police administration".

Though they have not said so explicitly, the "political interference" which most irks the political rulers as well as the police establishment, and which both are therefore keen to check, is of a different type. A Home Ministry note circulated among the state chief ministers last year on the "State of Police Morale and Discipline in the Country" harped on the alleged demoralisation among the police following "severe criticism of the police action during Emergency" and how important it was to restore the shattered morale of the police. The whole paragraph is worth quoting: "Large-scale agitations are organised in various parts of the country and the police forces are called upon to deal with these agitations. There would be no cause for police to act if the agitations remained peaceful. However, a disturbing trend is noticed in that the agitations turn violent and force the police into taking deterrent action. This is utilised to charge the government of excesses through the police machinery and thus the police forces are constantly under a threat of public criticism." What the assurance that steps would be taken to check "political interference in police administration" could really come to mean is that even the little scope for public scrutiny of criticism of the misdeeds and crimes of the police that now exists would be snuffed out. The Home Ministry note in fact had contained such an assurance to the police, especially on the question of having judicial inquiries into cases of police action resulting in firing and deaths.

Such very likely will be the eventual outcome of the promise of 'no political interference in police work' made by the chief ministers in Delhi.

Southern Africa

Legitimisation Games

Ninan Koshy writes:

AS cautious moves are being made in London and Washington for a process of legitimising the Rhodesian regime, South Africa's grand scheme for the whole Southern African region is being vigorously pushed.

The British government announced on May 22 that it was sending a senior diplomat to Salisbury to maintain close contacts with Bishop Abel Muzorewa. It was significant that this announcement was made at a time when the US Secretary of State, Cyrus Vance, was visiting London. The move, which the British government is anxious to explain as not being tantamount to recognition, is intended for the present to strike a balance in the claims of those who want immediate recognition

and those who consider the Salisbury regime as illegal. Britain realises that it has to be extremely cautious till at least the Commonwealth Prime Ministers' Conference in Lusaka in early August. While the representatives of the Commonwealth governments in London have described the elections in Rhodesia as a "fraud", the British government considers that the "results of the Rhodesia elections were significant and that it would be morally wrong to disregard them".

In Washington, pressure is mounting on President Carter to lift the sanctions against Rhodesia The US Senate by a 75-19 vote called on Carter to end sanctions within ten days of the installation of Muzorewa government While the vote is not binding on Carter, he has already announced that he would give a decision about sanctions by June 15. Whether the elections were conducted freely is a crucial question and a factor that Carter must consider in making that decision Therefore the decision will be construed as a verdict on the legitimacy of the regime in Rhodesia

The statements in London after the discussions between Cyrus Vance and the British government do not give much clue about the shape of the Anglo-American proposals today. In fact while the US and British administrations do not necessarily see eye to eye at the moment on the next steps regarding Rhodesia, there is evidently hope in Salisbury that by the end of the year both US and Britain will have recognised the new government and abandoned economic sanctions The British government hopes that after the initial reactions to US decision on sanctions, there will be time enough for new strategies

In Namibia too South Africa is preparing for an "internal settlement" and the chances of United Nations supervised elections are remote The South African government has already announced its decision to turn Namibia's 'constituent assembly' into a legislative one. This is another step along the road towards a unilateral declaration of the territory's independence. It is evident that South Africa does not want to risk a UN-held election in which the South West African People's Organisation (SWAPO) might win outright The Democratic Turnhalle Alliance, the South-Africa supported front which, as a result of fraudulent elections boycotted by SWAPO, holds 41 out of 50 seats in the "constituent assembly", wants to have self-rule granted quickly to entrench itself in power South Africa hopes that gradually an "interim government" in Namibia also will qualify for recognition by Western countries

These moves have to be seen against the background of South Africa openly assuming leadership of the whole region militarily and economically. There has been a major shift in South African strategic thinking that could have the effect of extending South Africa's defence perimeter to the Zambesi river which forms Rhodesia's northern frontier. The Prime Minister of South Africa recently stated that South Africa has decided to promote a constellation of states in the region. The scheme is that of a military and economic zone comprising of for the present South Africa, Rhodesia, Namibia, Swaziland, Transkei and Bophutatswana (the last two being "bantustans" of South African creation). All these are economically dependent on South Africa The objective of Pretoria's new foreign policy is to create regional security for South Africa by a militarily buttressed economic union. Bishop Muzorewa's government in Salisbury will come first on the list of those to receive military aid (especially for the air force) and economic support on such a scale as to prevent a large scale white exodus. It may be recalled that South African troops plunged deep into Angola during the civil war of 1975 in support of a weak leader (Savimbi) who could point to neither control of his capital nor any poll to validate his popularity. So South African determination to support the 'internal settlement' in Rhodesia is evident

In fact immediately after the elections Bishop Muzorewa stated that "we will take help from anyone who can help us as long as it is in the interests of our country We do not differentiate our neighbours on the colour of their skins". Such a stance will only further alienate the black masses from the 'internal settlement' ZANU and ZAPU the two wings of the Patriotic Front realise that the new developments demand from them greater political and military co-operation and unity The recent meeting in Addis Ababa made substantial progress along the lines It has, however, to be conceded that there are some fundamental differences in approach of the two wings ZANU prefers military unity now and political unity inside Zimbabwe later, ZAPU takes the opposite view. The Patriotic Front realises that the implementation of the grand scheme of South Africa is making its task all the more difficult

Non-Aligned Movement

Many Shades of Alignment

THE meeting of the 25 members of the co-ordinating bureau of the non-aligned countries at Colombo is actually being attended by delegations from all the 86 member countries, 38 of which are being led by the respective foreign ministers, as well as delegations from Grenada, Iran, Pakistan and Surinam which are seeking membership of the non-aligned movement, and a delegation representing the Heng Samrin government which is claiming that it should be allowed to represent the Kampuchea, and not Ieng Sary, the deputy premier in the Pol Pot government and the leader of the 'Official' Kampuchean delegation. Altogether, over 450 delegates from these 91 delegations have assembled in Colombo, no doubt an indication of the fact that the non-aligned countries take themselves very seriously.

Unlike in Belgrade last year during the meeting of the foreign ministers of the non-aligned movement when the issue of Cuba, nay its very membership of the non-aligned movement, had come under severe attack—though, characteristically, the final consensus arrived at at the end of the meet was to pretend that such serious differences did not exist—in Colombo, the deliberations have been heavily dominated by two other issues, one, who should represent Kampuchea, and two, whether Egypt, a founder-member of the non-aligned movement, should continue to be a member. The reason for Cuba ceasing to evoke strong passions might be that its presence in Africa is much less marked now than it was a year ago

It is however unlikely that either of these controversial issues will be resolved at Colombo. Despite the united Arab stand that Egypt should be expelled from the non-aligned movement, it is unlikely that such an expulsion would actually take place, not merely because Egypt has been able to secure support for its unilateral initiatives *vis-a-vis* Israel from many African and Latin American countries, but also because of the lack of credibility of any 'united' Arab stand in view of the continued close relationship many Arab countries which are now denouncing Egypt have with the US which after all has provided the crucial political and material support to Egypt to enable the latter to enter into this unilateral deal with Israel And despite the continuing opposition faced by the present regime in Kampuchea from Pol Pot forces, there is little likelihood of its being immediately, or even in the near future, run over, and the question of Kampuchea's representation may be conveniently allowed to be put off to September at Havana by when, the present isolation of the Heng Samrin regime may have become less acute

Non-alignment as a factor of conducting international politics came into existence, as the Sri Lanka president recalled in his inaugural address to the delegates at

Because of a strike at the States' People Press, the size of the issues has to be restricted till normal printing arrangements are restored

Colombo, at a period when there was 'bi-polarity' in international relations, with ideologically identifiable and mutually antagonistic 'blocs' headed respectively by the United States and the Soviet Union. That kind of 'bi-polarity' has long ceased to be a factor of international relations with the emergence of more than two rival centres of power. One might argue that even the non-aligned countries, by virtue of the sheer size of their conglomeration, also have become a not inconsiderable centre of power, so that each conclave of the non-aligned has witnessed a lot of manoeuvring on the part of one or other of the big powers to secure or, rather, since they are already there, further strengthen reliable allies within the movement.

With the contention among the big powers becoming more and more fierce, the prospects are that the countries of the non-aligned movement, increasingly unable to withstand the pulls from one or other of the big powers, will gradually allow themselves to be drawn to their camps—a process that has always been going on, for most of the non-aligned have been non-aligned in favour of this or that big power But, of course, the very concept of 'non-alignment' has had, from the beginning, something false about it in that the kind of 'alignment' that disqualified a prospective entrant into the not very exclusive club was membership of multilateral military pacts, while similar arrangements entered unilaterally by a member even with a leading military power did not disqualify the country from claiming to be fully non-aligned.

Arab 'Non-Alignment'

Romesh Thapar

WHO is going to educate the Arabs about the realities of international politics? Their current demand to 'suspend' Egypt from the non-aligned group of nations is illustrative of their simplistic attempts to equate every issue with so-called Arab interests. They believe this is possible because they sit on the oil that the world needs. The demand now being made on the non-aligned is too absurd to be considered seriously, but it will create confusion and bad blood.

Already, the Indian Foreign Office, or the pressmen who have been reporting its views, have created the impression that India's earlier categorical opposition to any suspension move against Egypt, one of the founders of the non-aligned movement, is being watered down. There is vague talk about abiding by some sort of consensus. One does not know whether it is an Arab consensus or a non-aligned consensus, despite the clarifications. This is a serious matter considering that we have already made certain commitments to other leading members of the non-aligned nations although, admittedly, Prime Minister Desai's categorical statements should reassure us.

Foreign Minister Vajpayee may be playing some sort of subtle politics, but he should realise that any attempt to interfere in Egypt's sovereign decision-making (*vis-a-vis* Israel) cannot be accepted. Tomorrow, for example, in the style of the Moroccan ambassador in Delhi, India could be pilloried by a bunch of mullah-controlled politicians. Moreover, any move to bind the non-aligned group of nations to some pre-conceived notions about the rights and wrongs of a particular policy is tantamount to turning the non-aligned into a bloc. This is what non-alignment is not, just in case some of the Arabs have forgotten.

Fortunately, the African and Latin American members of the non-aligned group are so incensed by the oil-price politics of the Arabs that they will never allow an anti-Egypt resolution to pass But the confusion can be considerable what with Cuba, and its 'liberation' activities, already a point of controversy. Here, Soviet influence will be peddled, and obviously behind-the-scenes deals will be sought, to get this or that advantage—Kampuchea, included.

It would be sad if the non-aligned are thrown at one another merely to use them as pawns in a growing struggle for areas of Superpower influence. If the Arabs are naive to imagine that the Government of India could align with them on Egypt, we also are to blame. We don't seem to be able these days to make clear what our stand is and what persuades us to take it. As I said, the Foreign Minister is beginning to play local politics in policy formation—and this is bad.

We have to take a hard look at what is happening in the non-aligned world. The tendency from various points of view to turn the non-aligned nations into a bloc must be checked by highlighting the violations and the distortions in policy which are sought. A growing failure at group level to halt these trends towards blocism could force India to detach itself from a long and worthwhile association. All the more reason that we act speedily to salvage the essential strengths of the non-aligned movement. The meeting in Colombo, early in June, should flush out these tangles, or else they will endanger the main conference in Havana.

Alas, in the Capital, only cursory attention is paid to such important issues. Even as the police continue their agitation in various northern states, and are being countered by detachments of the BSF, the traders too have decided to make known their impatience with the sales tax set-up and all the harassments it involves Naturally, the agitation has the thrust of the Jana Sangh behind it. Traders are its urban base. But, it should be noted that we have reached a point where nobody is prepared to raise a hand for the government of the day. It is now seen as some costly joke we have imposed upon ourselves, and the questioning is persistent as to when a change will occur.

The story which *The Indian Express* has been running for seven days on the L N Mishra murder case has only confirmed the impotence of the Janata government. From the investigations conducted by Justice Tarkunde, it is implied that the CBI was able both to subvert a genuine review of the case and to tie up investigators in a web of lies and fake evidence. The public assumption is that there will be no progress in the matter because too many key figures in the Establishment are involved and the politicians have no stomach for these investigations for fear that they tend to snowball. If the assumptions are accurate, it is a frightening story of deception, manipulation and fraud at the highest levels of government.

We are also moving into the drama which will be enacted with the setting up of two special courts in the Capital. The Congress(I) has announced that it will not allow these courts to function. Here, again, firm governance is demanded—and no one believes it will be provided. The agitation against the special courts, it is believed will be conducted in such a manner as to further malign the judiciary and make it look ridiculous. This could happen if the courts are made helpless in the face of mobsters and the like. After all, the training exercises have already been held at several places in the north where son Sanjay had summons served on him.

Meanwhile, at some points in the maze that is the Government of India, an effort is being made to warn us, of the possibility of massive inflation if wage hikes and lack of productivity mark the only economic activity in the country. But attention is focused elsewhere. The anti-liquor and pro-cow protagonists, who dominate the GOI, are obsessed with their silly commitments—very much in the manner of the Islamic fanatics. We plod in Delhi wondering where all this will lead. Even the summer has not really descended, and monsoon forecasters are perplexed. All the more reason to watch prices.

June 2

Crude Steel Production

CRUDE STEEL production in the 29 countries reporting to the Brussels-based International Iron and Steel Institute (IISI) rose for the first three months of 1979 by 9 2 per cent over the first quarter of 1978, giving a cumulative total of 119 57 million tons. The IISI commented that the latest output figures indicate "the continuing firmness of steel demand in most areas". The increases in the United States and Japan have not been matched in the member countries of the European Community, where production grew only 4.4 per cent for the three months. Among the EEC nations, the Federal Republic of Germany showed an increase of 6 4 per cent in steel production for the first quarter of 1979 over the same 1978 period, while the figures for the Netherlands and Belgium were 8.7 per cent and 7 8 per cent, respectively.

Growth through Diversification

Hansavivek

AMAR DYE-CHEM has commissioned its vat dyes plant and is going ahead with various other projects. It is awaiting conversion of a 'letter of intent' for setting up the rubber chemicals project in Gujarat into an industrial licence. Meanwhile, design and planning has begun and orders have been placed for long delivery items. The company is already manufacturing certain items at the existing facilities and is also marketing them. Installation of the new acrylic fibre dyes plant at Shahad near Bombay is in final stages of completion. The management expects that the full range of these dyes will be marketed by the end of the current year. The design and pilot plant work, on the disperse dyes project, are complete. The civil construction work at Vapi in Gujarat is expected to start soon and commercial production is expected during 1980. The design, based on technical collaboration of AKZO Chemie of Holland for PVC stabilisers, is in the final stages. Some trial quantities are likely to be manufactured later this year. The company has obtained an industrial licence for manufacture of salicylic acid and its derivatives, at Vapi. Design work has already commenced. The company has also been issued a registration certificate for the manufacture of 50 tonnes per annum each of Simazine, Altrazine and Nitrofen. Pilot plant trials have been completed and test-marketing is to be taken up shortly. The design of the commercial plant is in progress. The company is awaiting permission of the Company Law Board to hold 25 per cent of the equity capital of the new company floated in Indonesia for a joint venture in that country for manufacture of certain ranges of dyes. The venture is being set up in association with Tungabhadra Industries, International Textile Corporation, Bermuda, and C V Kitaco of Indonesia. All preliminary work has been completed and production at the project is expected by the end of this year. The company, Amar Dye-Chem, has turned out poor results for 1978, despite higher production and sales. Production during the year was 7,412 tonnes against 6,904 tonnes in the previous year and net sales were Rs 22.93 crores against Rs 21.63 crores. However, gross profit declined to Rs 3.03 crores from Rs 3.47 crores. Profit margins shrank due to a rise in the wage bill, higher level of fuel and transport costs, hike in power rates, and increased operating expenses. Dividend, maintained at 12 per cent, is still adequately covered by earnings. In order to provide funds for working capital, the company is issuing one lakh 11 per cent debentures of Rs 100 each to the shareholders on a 'rights' basis. These debentures would be redeemed in five equal annual instalments from the eighth year.

SCHRADER-SCOVILL DUNCAN is expanding and diversifying its business. It has received a 'letter of intent' enhancing the capacities of some of the fluid power products and another to manufacture hydraulic hoses and fit-

tings and oil seals. The management is having discussions with prospective collaborators for the latter project. The subsidiary, Associated Polymers, started production last year and made a pre-tax profit of Rs 6 lakhs. SSD has shown satisfactory results for 1978, with both turnover and profits slightly higher than the respective figures of 1977. Dividend is raised by two per cent to 18 per cent. These results have followed despite prolonged shortage of copper in the second half which restricted production of automotive products. Besides, the small-scale manufacturers, who supplied the company components, could not meet quality standards and delivery schedules resulting in occasional interruptions in production The registered office of the company is proposed to be shifted from Calcutta to Bombay

MOTOR INDUSTRIES COMPANY is looking ahead to further growth in the current and coming years, since the upward trend in the diesel engine industry continues to be strong The company has recorded impressive increase in domestic sales, particularly in original equipment business which expanded by 28 per cent last year. The boom in the original equipment business was shared both by single-cylinder fuel injection pumps for stationary engines and multi-cylinder fuel injection systems for commercial vehicles. The stationary diesel engine industry stepped up its production to meet the sharp rise in demand from farmers The output of the tractor and commercial vehicle industries also increased substantially Exports of MICO products showed a further rise The company exported its products to USA, USSR, France, Italy, Brazil, Bangla Desh, Sri Lanka, Saudi Arabia, Egypt, Thailand, Argentina, Singapore, the Philippines, Iran, Spain, Burma and Australia During 1978, its net sales increased from Rs 59.43 crores to Rs 70 71 crores and, with a slight shading of margins, gross profit rose from Rs 15.47 crores to Rs 18.21 crores Net profit came to Rs 4 22 crores (Rs 3 81 crores) Dividend raised by a point to 15 per cent is covered 1 81 times The company has intensified its campaign to achieve cost reductions wherever possible. Further rationalisation in the factories both at Bangalore and Nasik has been introduced as part of a long-term plan. Technology is also being upgraded and new methods are being adopted.

WANDLESIDE NATIONAL CONDUCTORS has shown improved results for 1978 with a slightly higher turnover and profitability, although its operations were affected on account of labour unrest which continued until the end of July 1978 and shortage of copper during the second half of the year. Shortage of copper was mainly due to reduction in allocation to actual users by MMTC. Increased production during the latter part of the year and greater demand for high contribution items brought about overall improvement in the company's performance. Dividend is raised by a point to 8 per cent. The directors point out that the recent increases in copper prices and excise duties have aggravated the working capital problem of the company, which is heavily dependent on bank finance. Prospects for the current year, however, appear to be good, as both production and sales have shown an improvement and pending order position is also comfortable.

PINE CHEMICALS, promoted by Camphor and Allied Products, is coming to the market with a public issue of 6 lakh equity shares of Rs 10 each to raise a part of the finance required for its Rs 2.70-crore project being established in J and K for processing 10,000 tonnes of pine gum rosin which would enable annual production of 2,750 tonnes of rosin, 1,800 tonnes of turpentine, 1,000 tonnes of polymerised rosin and 3,600 tonnes of rosin derivatives. Some of the rosin derivatives to be manufactured by the company are ester gum, penta ester gum, maleic rosin ester, modified phenolic rosin, calcium and calcium zinc rosinate Rosin and its derivatives are used in the paper, paints and varnish, rubber chemicals, soap, adhesives and germicides industries. They can also be used for linoleum forming and sealing wax formulations because of their good adhesive properties Turpentine finds extensive use in paints and varnish industries and also in the manufacture of camphor and perfumery chemicals. The main raw material, pine gum rosin, is available from pine trees in the forests of Kashmir valley. The company has entered into a long term agreement with J and K forest department for the supply of 9,000 tonnes of pine gum annually on a fixed price basis for the first 5 years, after which the price is subject to change, within the limits of 10 per cent higher or lower than the agreed price. Thus the company is assured of the raw material supply. Complete technology for processing pine gum rosin to produce rosin, turpentine and rosin derivatives has been developed indigenously by Camphor and Allied Products at its research centre, Baroda. The plant is expected to go on stream by November this year.

WARNER-HINDUSTAN has recorded a 12 per cent rise in sales for the first five months of the current year as compared to the corresponding period last year. The chairman, K H Bhabha, however, feels that it will be difficult for the company to sustain in future the growth achieved in the past because of the adverse effects of the new Drugs (Prices Control) Order, 1979, whereby restrictions have been imposed on the capacities, release of canalised raw materials, introduction of new products and pricing of drugs. Moreover, there is a "steep reduction" in formulations' profitability. According to him, it will be extremely difficult for the company to earn 8-9 per cent profit on turnover exclusive of excise duty, as against 15 per cent on the formulations' turnover inclusive of excise duty allowed so far.

KERALA

Divided Ruling Front

K T Zacharias

DEFEATED in the by-elections and with not much hope of things improving in future, the Kerala Ruling Front is divided and confused. It is conceded by all that in any triangular contest, the CPI(M)-led United Front will emerge victorious. This writing on the wall has compelled the partners of the present ruling coalition to desperately search for allies to "broaden and strengthen" the Ruling Front. But the Ruling Front is divided on the means to achieve this objective.

The CPI has understood the defeat in the by-elections as indicative of the growing criticism of the Ruling Front and the activities of its government. So it has called upon the government to take more welfare measures to win back the confidence of the people. At the same time, the CPI State Secretary, N E Balaram, had a meeting with the CPI(M) leader, E M S Namboodiripad. Balaram told EMS that the Ruling Front was willing to resign after coming to an understanding with the CPI(M). First resign and then talk, was understood to have been Namboodiripad's curt reply.

The Youth Congress has publicly demanded that the "Congress should come out of the ministry". But it is not against supporting the ministry. It has levelled serious charges of corruption and misuse of the police force. The attack is mainly directed against the Kerala Congress. The student wing of the Congress, the KSU, it is understood, has passed a resolution demanding the resignation of the ministry. It has also charged the government with following "rightist policies". But Oommen Chandy, former minister and one of the top leaders of the Congress, told this correspondent that there was no question of the Congress quitting the ministry. Nor was there any possibility of a change in KPCC leadership. The Kerala RSP wants that the "Ruling Front set-up should be re-oriented with greater leftist slant". The Kerala Congress wants to "expand the base of the Ruling Front by including the political parties and groups with whom they could join on the basis of programmes and policies, through prolonged discussions and negotiations". It also wants to improve and strengthen the relations and understanding between partners in the Front.

The CPI(M) wants the "discredited and defeated" coalition to resign to facilitate a realignment of political forces. The other members of the CPI(M)-led united front have also taken the same position. The Congress (I) and its partner, the NDP, have also demanded the resignation of the ministry.

The demand for the resignation of the ministry has started gaining momentum. The annual conferences of a number of important trade unions held during the past weeks have demanded the resignation of the ministry. One of the big three in the Kerala newspaper world, the *Mathrubhoomi*, has editorially advised that it is better for the coalition to resign and seek a fresh mandate. *Kerala Kaumudi*, the third largest newspaper, has also recommended resignation in these circumstances as a healthy parliamentary practice. The *Malayala Manorama*, the biggest of the big three dailies, has called for the "unity of the democratic forces" which means the present Ruling Front plus Congress (I) and NDP, that is, the restoration in full of the anti-CPI(M) front formed in 1969. The Kerala Congress and the Muslim League would very much like to have such a front re-established. The CPI and the Congress would, however, prefer an understanding with the CPI(M) front.

Initially the CPI tried to attract just the CPI(M) and expand the Ruling Front. But this was promptly turned down by the CPI(M). Now, CPI state secretary Balaram has publicly stated his willingness to expand the present Ruling Front through the inclusion of the CPI(M)-led Front, excluding only the RSS part of the Janata. The CPI(M), on its part, has made it clear that all the partners of the Ruling Front are not acceptable to it as some are anti-CPI(M) and has reiterated its position of "resign and then talk". The CPI(M) just now is talking from a position of strength, while the ground is slipping fast from under the Ruling Front.

Each party in the Ruling Front has started assessing the strength of its allies and the opposition parties. The CPI(M) is, of course, the largest single party. Next comes the Congress (I). But it is a very poor second. Of the recent five by-elections, in two the two Congresses were pitted against each other. And in both, the Congress (I) secured the second position and the Congress the third. The Swaran Singh Congress by itself will not be able to secure many seats. The parties with real mass base in the Ruling Front are the Kerala Congress and the Muslim League. But then, their support is limited to certain pockets. Besides, the Muslim League has a rival in the Opposition League. And the Kerala Congress is threatened with a split. The Kerala RSP has some following in Quilon district. The CPI, though it can claim an all-Kerala spread, no longer has the mass base to win many seats. The CPI, the Congress and the Janata are generally assessed as having more or less the same strength, though the CPI is better organised. In the 1977 elections, the Ruling Front had secured nearly 51 per cent of the votes and 113 of the 140 seats. In the current by-elections in the four constituencies, the CPI(M) Front secured 46 per cent of the votes and all the four seats, while the Ruling Front secured 32 per cent of the votes and none of the seats. Such being the division of political forces, the result of any election is a foregone conclusion.

What the statements of the Ruling Front partners about the need for more radical policies, left-orientation, etc, means, after having been in power for a decade, is anybody's guess. Is it an indirect admission to the CPI(M) that it has been following wrong policies? The state chief minister declared the other day, at a conference of public sector executives, that the public sector has become a 'curse' and "a drain on the public exchequer". Top leaders of the CPI have been handling the Industry portfolio ever since 1967 and the chief minister's admission is ample proof of the failure of the Ruling Front and the CPI in particular. In this context, the idea of effecting ideological shifts overnight is just tall talk. If things were that simple, the Ruling Front could have just continued in office. Even today, it has a strength of 85 in a house of 140. Yet it is evident that the Ruling Front feels very insecure.

The politics of reformism and opportunism practised by the CPI in Kerala has come the full cycle. The same fate has overtaken the other partners of the Ruling Front. To resign or not to resign is the question, every party is divided, including the national leadership of the CPI. For the CPI, to reassess its role in 1969 and since then would mean a total shake-up in the party.

WEST BENGAL

Flogging and Patching Policy

Timir Basu

WHEN all the five working units, at Bandel and Santaldih, broke down at midnight on May 16, it was the first such time in the history of the West Bengal's State Electricity Board. But it was not quite an accident; it was part of the accumulating power crisis. Yet the authorities' response again was to discipline workers. When workers and engineers were working round the clock to right the ailing units at Bandel and Santaldih, termination notices were suddenly served on 21 employees who had been recruited by the erstwhile Congress ministry. These workmen, who have been employed for the last six years, were dismissed from service on 'police reports'.

Murshed, the power secretary, has been busy with his plan to bifurcate the Board. one responsible for generation and the other for distribution. Meanwhile, the causes of the mechanical troubles requiring a shutdown, the continuous power cuts, the production losses, continue. The nature of the defects have been known and repeatedly mentioned over the last year. Among them are serious lapses on the part of the management.

The Bandel plant, which has all along been adjudged to be the best maintained one, recently developed tube leakage similar to that in the Santaldih plant. All four units had been on load for six months without due overhauling. The seriousness and frequency of the breakdowns are thus increasing. In the early hours of April 8, the superheater zone in unit No 1 developed a tube leakage and the authorities shut it down only in the evening. Such a delay in shutdown would, of course, have endangered its life. On April 13, the unit was put on load just before noon. It went out of commission on April 20, again because of boiler tube leakage. Meanwhile, the management had no alternative but to close down unit No 2, also in order to avoid accident. Before a thorough overhaul was complete, the unit was restarted at midday of April 15: the boiler was fired at 2.10 p m, but by 6.37 p m shutdown was ordered. This time the tubes had developed not leakages but ruptures. Meanwhile, unit No 4 was in operation—notwithstanding leakage in the primary superheater and economiser. It broke down on April 18, in the evening.

In fact, until April 23, all units except unit No 3 had suspended generation. But the condition of even this unit required immediate shutdown, according to some workmen of the plant, as the unit had not been overhauled for 20 months. Patch-work *after* breakdown merely shortens the life of the unit. Before it was shutdown, unit No 4 had been producing power, despite minor tube leakage, for 13 days. The workers' union's protest was turned down. By the time the shutdown was ordered on April 18 what was a minor leakage had become a major hole. Meanwhile, high pressure steam had weakened the adjoining tubes too, thus shortening the life-span of the unit.

Indeed, continuous running of the plants, neglecting even routine maintenance, is one of the major sources of tube failure. Of late, as the power situation has worsened, the peak load percentage for Bandel units had surpassed all permissible norms. Political interference compelled the power authority, time and again, to maintain the peak load for periods so long that they endangered the life of the plant itself.

Another major reason for frequent tube leakage is the high range of flue gas velocity. Bandel boilers are designed to tolerate high ash content coal, but for years together coals with an ash content far beyond the tolerable percentage—sometimes containing more than 30 per cent ash—have been utilised. High ash content means high flue gas velocity. Finally the tubes get injured. Heated coal dust passing by the tubes corrodes them. The rate of corrosion is so high that frequent leakage results. It is alleged that coals with 40 per cent ash content are almost regularly charged at Bandel.

Again, nobody at the plant site seems to bother about the size of coal. Coal sized 1'-1.5' is used instead of the required size of 3"-5". Over-size damages the vibrator and paves the way to poor performance. Sometimes, even cement blocks are reported to have been detected in coal wagons.

For the last seven years, all the four units at Bandel have been running without feed water heater No 1 though each unit should possess five such heaters. Non-functioning of feed water heater No 1 means less heated water for the boilers. If production is to be maintained, excess coal must then be fired. This, in turn, increases the percentage of flue gas velocity and ultimately the superheaters get overheated. This superheater zone is a permanent source of leakage. Importation of feed water heater No 1 has been denied on the plea of a shortage of foreign exchange—though it has in effect meant loss worth hundreds of crores of rupees. Workers and technicians of the plant have repeatedly protested against such mismanagement, in vain.

Mismanagement in operations has reached such proportions that the Bandel thermal power station (BTPS), otherwise the best generating station in the state, may soon have to be declared obsolete. The plant needs alkaline water to arrest corrosion of the tubes. On April 15, chemicals were charged directly instead of slowly through a pipe with the help of a motor. As a result, tubes were ruptured. Chemicals carried over to the superheater zone cannot be suppressed, and a circular from the office of the Superintendent (OPRN) Mechanical, regarding cleaning of Boiler No 2 illustrates the callousness at the operational level. The circular dated April 27 reads: "It is apprehended that some chemicals, *viz*, trisodium phosphate, caustic soda, etc, have found their way inside the superheater tubes and deposited there. These deposits are harmful to the boiler tubes as they act as impediment in the way of heat transfer." It is also abnormal that an oxygen analyser is not maintained in all the four units at BTPS. In the absence of such analyser, flue gas velocity rapidly increases, and the tubes get quickly corroded. However, since simple roster pumps can do, management is reluctant to install the oxygen analyser. Patching up of minor leakages and cut-tube welding for major ones has, over the years, shortened the life of the tubes. If technical defects and mechanical errors are allowed to pile up, tubes will develop ruptures and blaming the workmen will not help. Negligence, inefficiency, and failure on the operational side are responsible for the miserable situation at BTPS.

Before examining the 'human factor' the Santaldih plant deserves attention at the technical level. If Bandel has the problems of leakage, Santaldih has problems of ruptures. Of late ABV (Durgapur), the boiler maker, has been very much in the news in relation to Santaldih. Boilers of all the three units failed due to in-built metallurgical defects. Neither the turbines and ancillaries of BHEL nor the boilers of ABV were evidently tested at the time of delivery. BHEL now have a permanent office at Santaldih to attend to consequent troubles. Each unit supplied by BHEL, supposed to produce 120 MW (peak load), goes out of commission if the load be increased to 90 MW. ABV reportedly dumped substandard equipment. Designing is no less important a source of trouble. DCPL (Development Consultant Private Limited) is responsible here. Whenever there was attempt at Santaldih to raise the load up to 100 MW, a particular zone of the boiler wall tubes would develop cracks. All three units have this problem. So a load-limit of 70-80 MW had to be put for unit

No I and 80-90 MW for unit No II. Despite this, tubes of unit No I were blown since water circulation was stopped.

With the change in management of the SEB in December 1977, the chairman ordered increase in production at Santaldih to surmount load-shedding. In the event, unit No 1 and No 2 were put on 100-120 MW load. Its immediate consequence was the tube-rupture which led to shutdown. Workmen allegedly owing allegiance to the Naxalite union were blamed for the failure of the power plant and, under plea o. sabotage, 'Operation Santaldih' was carried out in the second week of June 1978. Immediately afterwards, the units were put back with the load limit. For some time there was stability in generation, which seemed to confirm for a section of the Press that 'Naxalites' had indeed been responsible for the 'misdeeds'.

Santaldih boiler tubes are easily susceptible to even slight variation in thermal stress. Tube-bindings are designed such that unequal expansion is usual. Unlike Bandel, free ends of tubes at Santaldih do not get any space to expand in case of excess stress and hence tube-bending is a must. Tubes are thus easily weakened resulting in leakage and, finally, rupture. Time and again it has been proved that Santaldih boilers can withstand steam flow of 350 tonnes per hour, whereas designed capacity is stated to be 393 tonnes per hour. This 350 tonnes per hour steam flow can generate only 75 MW. Whenever there is an attempt to increase the steam flow, the furnace well tubes fail to circulate water and the tubes getting overheated virtually become elongated balloons. In-built metallurgical defects of the boiler and the boiler tubes, for which ABV (Durgapur) is responsible, have never been taken into serious account. Neither the government nor the WBSEB has ever held ABV responsible for its supply of substandard machinery. As an aside it may be that the CITU-led union at ABV has good relations with the management and some 55 CITU activists who were previously on the muster roll of ABV were given permanent employment at Santaldih immediately after June 1978.

Periodic checking of boilers by the boiler directorate was denied at Santaldih. In February 1978, the contract for boiler repair was awarded to a contractor, but later the SEB workmen were deployed since the contractor firm failed. BHEL's mill motors frequently go out of action, and feed pumps and seal oil system are defective. According to Kamal Ghosh, the victim of the Murshed plan, BHEL's feed pump bearings give the maximum trouble.

The coal pipes at Santaldih, supplied by ABV, havd become a problem too. These pipes have a number of flexible bendings and some special quality rubber tubings are required for the purpose. Rubber tubings of the pipes can hardly tolerate temperatures of 90°C though they are supposed to withstand 100°C. The result is leakage and permanent injury to the pipes, exposing the sensitive parts of the machinery to heated coal dust and highly inflammable carbon monoxide. Unit No 2 was closed down when its cables were burnt due to this coal dust. Now 114 cable joinings are required to put it all back into operation. Also, pumps, motors, and tubes get choked with high temperature coal dusts discharged from the coal pipe and sometimes they are damaged beyond repair. On the last occasion, unit No 1 necessitated a shutdown because the leakage in the water line was ignored at the early stage and an explosion was only narrowly averted. These are maintenance lapses which could be avoided.

Negligence still plays havoc. Thus, on April 17, a motor worth Rs 2.5 lakhs caught fire from sparks of welding and was completely destroyed. What was needed was simply a metal cover which was not provided.

Development Consultant Private Limited (DCPL) was consulted at every stage of development at Santaldih. Some major designing defects at Santaldih are costly gifts of this firm. Pumps have been installed underground with concrete roof-tops, as if they will not require maintenance. The arrangement of the feed pumps at Santaldih is a classic example of DCPL consultancy service. Each boiler has three feed pumps. They are so arranged at Bandel that any one of them can be overhauled without jeopardising production. But at Santaldih the shutdown is essential if the second feed pump is put under servicing.

The Enquiry Report on the disaster of unit No 3 was submitted immediately after the accident. The staff has little faith in it, however. Allegedly, 150 tubes were ruptured in unit No 3, perhaps an all-time record in mechanical failure. But operational failure and metallurgical defects were reasons given for the mishap at unit No 3 by some engineers and technicians. ABV is reportedly trying to shift the entire burden onto operations. Metallurgy is the responsibility of ABV, and it was the principal factor in this case.

In any case, Santaldih is a wrong site by all accounts. It has neither coal nor water nearby, though it is a thermal power station. It is not the load centre either; the entire load is despatched to greater Calcutta. If today Santaldih were to run at 80 per cent capacity, the Santaldih-Durgapur-Howrah channel would fail to carry the load. If the fourth unit is indeed commissioned in time, the channel would be the biggest problem.

Both at Bandel and Santaldih oil burners are frequently used, even in normal times, and once a fire did result. It is alleged that sometimes peak load is maintained with the help of load burdeners. All this makes for incurable injuries to plant machinery. Indeed, today's plight is attributed to the cumulative effect of all these factors.

The contradiction between transmission and distribution—i e, the TD section and generation or the mechanical wing—is likely to get sharper with the recent split in the Engineers' Association. The SEB men's complaint is that their expertise is not utilised while inferior technology is imported at a higher premium. Similarly, engineers in CESC and DVC get twice what their counterparts do in SEB. The recent move by Murshed, the power secretary, to split the Board into generating and distributing corporations has added fuel to the fire, as it is designed to place mechanical engineers in a more advantageous position A crisis in management is imminent and the government seems too preoccupied to overcome it. The authorities are busy purchasing power from other states. But stabilising its own production is going to be crucial to its own future plans.

ALIGARH MUSLIM UNIVERSITY

Capitalising on Communal Violence

Krishna Gandhi

PROBABLY for the first time since its inception, the Aligarh Muslim University (AMU) was the scene of communal violence on the night of May 10. That night shops in the Shamsad and Zakaria markets adjoining the University Campus, belonging mostly to Hindus, were set on fire by mobs of students. More gruesome than this, four persons were murdered by unknown assailants and one employee of the University was killed in police firing making a total of five dead. Scores of students were seriously injured in the clash with the police. The University has been declared closed till July 2 and all the hostels have been vacated. Life is at a standstill in the University area, parts of which are still under round-the-clock curfew. This violence in the compus contrasts sharply with last year's communal riots in Aligarh city when the AMU students (with Muslim-non-Muslim ratio of 55:45) had provided shelter and relief to riot victims. In the city itself a dusk-to-dawn curfew was in force even after more than ten days of the incident. An undercurrent of tension has gripped the city's population who are apprehensively waiting for the next flare-up of communal violence from which there seems to be no escape for them.

The Aligarh Muslim University was established in 1920 and till independence was governed by a 'Court' consisting wholly of Muslims, but with the ultimate power resting with the Governor-General. After independence the first AMU Amendment Act was passed in 1951 which, while retaining many of the provisions in the old Act, changed the composition of the Court to include non-Muslims. Also, religious education was made optional even for Muslims. Other amendments followed in 1965 and 1972 which took away the autonomous powers of the University to a great extent. The Court's powers were greatly curtailed, giving the Central government a direct role in the governance of the University through the Executive Council. Because of the emotional attachment of the Muslims of North India to the University (many of the leading Muslim leaders in pre-and post-independent periods have been products of AMU), various political parties from time to time have played upon the issue of the status of the AMU to their own advantage. In 1977, the Janata party promised minority status to the AMU to gain Muslim votes, though the fact is that the AMU has never been a minority institution despite being dominated by Muslims. After coming to power the Janata party did not keep its promise. The AMU Amendment Bill introduced in May 1978 and finally passed in the Lok Sabha about a month ago has sought only to restore some of the autonomous powers curtailed in the previous Amendment Act of 1972.

It was against this background that the AMU Students' Union decided to hold a rally on May 9 in front of Parliament to press for the granting of minority status to the University. According to a section of the campus community, the Vice-Chancellor is alleged to have played an active role in organising the rally. He is also reported to have sanctioned Rs 70,000 as demanded by the Students' Union, for the same purpose.

The immediate provocation for the flare-up on the night of May 10 was the incident that took place the day before near Dadri railway station in which some 600-700 AMU students, who were travelling to Delhi to join the rally, were attacked and brutally beaten up. There are two versions of the incident. According to one version, some students of the local DS College, considered a stronghold of the RSS, had also boarded the train along with the AMU students. These RSS elements are alleged to have organised a gang of students and others armed with lathis and iron rods about 2 km away from Dadri station. The train was stopped at this point by pulling the chain and the gang, approaching the train, asked all except the AMU students to get down. They then got inside the compartments and proceeded to beat up the students systematically and brutally. According to a second version, the AMU students had crowded into the train which carried a large number of milkmen travelling to Delhi. Altercations developed between the students and milkmen who sent advance instructions to fellow milkmen waiting to board the train at Dadri to organise a gang near the Dadri station. When the train reached there it was stopped and the AMU students were then brutally beaten up. Whatever the case be, there is no doubt that the attack was an organised one, though the role of the RSS in it seems to have been rather exaggerated. In the attack more than 70 students were injured while none of the attackers were hurt. Those seriously injured were taken to Delhi for treatment in the same train and those with less serious injuries returned to Aligarh.

The attack at Dadri took place around 9 a m and by early afternoon the first batch of students had returned to Aligarh. The news of the incident spread like wild-fire among the remaining students in the campus who formed about half the total strength. The attack was painted as the dastardly act of the RSS and communal feeling were whipped up among the students. An abortive bid was made to burn a vehicle around 4.30 p m. Meanwhile the district authorities moved in a number of police contingents to the Shamsad market area which lies almost inside the campus. This further provoked the students. In the evening they marched to the Staff Association building where the teaching community gather regularly in the evenings and accused the teachers of not coming to their help but instead of enjoying themselves as if nothing had happened. Some of the students were rebuked by some teachers for their misbehaviour and their houses were later attacked by the students. The students wanted the police to be removed immediately from the campus premises. That night the University authorities (the VC was away in Delhi) met the district administration and requested them to remove the police which was then shifted to the compound of the Employment Exchange near MacDonnel Hostel. Nothing further happened that night.

Early in the morning of May 10, around 3 a m, the students who had gone to attend the rally in Delhi came back in buses bringing the injured also with them. However, the top union leaders were not yet back. A meeting of the Students' Union scheduled at 10 a m had to be postponed to the evening. The VC who had by then returned called a meeting of the teachers for discussing the situation. However throughout the day no positive step was taken to defuse the situation.

That evening too, students assembled before the staff club and accused the teachers of sabotaging the students' interests. The furniture, windowpanes etc of the building were damaged. Some sources in the campus claim the hand of Muslim communalists behind these attacks because they had not fully supported the demand for the granting of the minority status to AMU. From the Staff Club the students marched to the residence of the VC to demand the total withdrawal of the police forces from the campus. Meanwhile on the Anupshahar road passing between the Shamsad market and the various student hostels, a bus was set on fire by a mob of students. An attempt was also made to stop a police truck coming down the road from the Radio Colony side by putting obstacles in front of it, but it was unsuccessful.

Around 7 p m the students from the roof-tops of the hostels started hurling stones at the police stationed on the

opposite side of the road. There was also firing with country-made pistols, having a range of 10 feet or so. Around 8.30 pm the first shop (a sweetmeat shop) was attacked. The police who were watching did nothing to prevent the attack but instead marched down the Anupshahar road. They were then stoned and brick-batted and the police retaliated by lathi-charging the students. Meanwhile around 9 pm, the University siren was sounded by someone. (The siren is usually sounded to summon the students for general meetings.) Students from the hostels started pouring out in large numbers and joined the mob on the road. From then onwards large scale arson of the shops began. About two dozen shops in the Shamsad market along a half-a-mile stretch on the road were set on fire. Most of the shops belonged to Hindus.

During the clash between the police and the students, a rifle of a ploiceman was snatched by someone. Some of the policemen entered the compound of the nearby 'Aftab Manzil' where they started searching for this lost rifle and in the process intimidating the residents there. A student was caught and brought to the compound where he was brutally struck by rifle-butts. In the prevailing confusion, the ex-president of the AMU Students' Union, Javed Habib, who had come to pacify the students, heard that some students were trapped in the Aftab Manzil compound. As he approached the compound along with two others in a bid to help the students, the police fired on them. One of his companions, Mohammed Ahmed, an employee of the Medical College, was killed in the firing.

Meanwhile in another part of the campus near the Zakaria market and the Medical College worse things were happening. The local people allege that goonda elements from city started coming into the area around 8.00 pm. Three shops in the Zakaria market were set on fire. Praveen Kumar Saxena, a BSc (Engg) Final Year student of AMU, who was seen riding on a scooter through the area at that time, was murdered with his body along with the scooter was discovered lying in a gutter nearby. In the same area, three more bodies were subsequently found. In all these four cases, death was due to knife-wounds and in some cases also of gunshot wounds. The knife-wounds were expertly inflicted.
